Statement of Qualifications and Limitations

The attached Report (the "Report") has been prepared by AECOM Canada Ltd. ("Consultant") for the benefit of the client ("Client") in accordance with the agreement between Consultant and Client, including the scope of work detailed therein (the "Agreement").

The information, data, recommendations and conclusions contained in the Report (collectively, the "Information"):

- is subject to the scope, schedule, and other constraints and limitations in the Agreement and the qualifications contained in the Report (the "Limitations");
- represents Consultant's professional judgement in light of the Limitations and industry standards for the preparation of similar reports;
- may be based on information provided to Consultant which has not been independently verified;
- has not been updated since the date of issuance of the Report and its accuracy is limited to the time period and circumstances in which it was collected, processed, made or issued;
- must be read as a whole and sections thereof should not be read out of such context;
- was prepared for the specific purposes described in the Report and the Agreement; and
- in the case of subsurface, environmental or geotechnical conditions, may be based on limited testing and on the assumption that such conditions are uniform and not variable either geographically or over time.

Consultant shall be entitled to rely upon the accuracy and completeness of information that was provided to it and has no obligation to update such information. Consultant accepts no responsibility for any events or circumstances that may have occurred since the date on which the Report was prepared and, in the case of subsurface, environmental or geotechnical conditions, is not responsible for any variability in such conditions, geographically or over time.

Consultant agrees that the Report represents its professional judgement as described above and that the Information has been prepared for the specific purpose and use described in the Report and the Agreement, but Consultant makes no other representations, or any guarantees or warranties whatsoever, whether express or implied, with respect to the Report, the Information or any part thereof.

Without in any way limiting the generality of the foregoing, any estimates or opinions regarding probable construction costs or construction schedule provided by Consultant represent Consultant's professional judgement in light of its experience and the knowledge and information available to it at the time of preparation. Since Consultant has no control over market or economic conditions, prices for construction labour, equipment or materials or bidding procedures, Consultant, its directors, officers and employees are not able to, nor do they, make any representations, warranties or guarantees whatsoever, whether express or implied, with respect to such estimates or opinions, or their variance from actual construction costs or schedules, and accept no responsibility for any loss or damage arising therefrom or in any way related thereto. Persons relying on such estimates or opinions do so at their own risk.

Except (1) as agreed to in writing by Consultant and Client; (2) as required by-law; or (3) to the extent used by governmental reviewing agencies for the purpose of obtaining permits or approvals, the Report and the Information may be used and relied upon only by Client.

Consultant accepts no responsibility, and denies any liability whatsoever, to parties other than Client who may obtain access to the Report or the Information for any injury, loss or damage suffered by such parties arising from their use of, reliance upon, or decisions or actions based on the Report or any of the Information ("improper use of the Report"), except to the extent those parties have obtained the prior written consent of Consultant to use and rely upon the Report and the Information. Any injury, loss or damages arising from improper use of the Report shall be borne by the party making such use.

Dear Colin Baker:

Project No: **60149110**

Regarding: **2010 Annual Groundwater Monitoring Report**
Former IMICO Site, 200 Beverley Street, Guelph, ON

We are pleased to present you with the 2010 Annual Groundwater Monitoring Report for the former IMICO site located at 200 Beverley Street, Guelph, ON. This report includes results from groundwater level measurements recorded in March, June, October, and December, and groundwater sample results from monitoring events that occurred in June and October of 2010.

We trust that this report meets your requirements. Please contact us if you have any further questions.

Sincerely,
AECOM Canada Ltd.

1. Introduction and Background

The City of Guelph retained AECOM to undertake groundwater monitoring activities throughout 2010 at the Former International Malleable Iron Company (IMICO) site (the Site) located at 200 Beverly Street, Guelph, Ontario (Figure 1). Currently the Site is owned by the City of Guelph. The site is approximately 5.2 ha (13 acres) in size and is currently inactive. Prior to 1989, the Site operated as a foundry. Since that time all structures have been decommissioned and demolished.

A preliminary site assessment and investigation was completed in 1989 and 1991 by Proctor & Redfern that identified several subsurface contaminants present at the Site (Proctor & Renfern, 1991a; Proctor & Renfern, 1991b). The report identified various metals, petroleum hydrocarbons (PHCs), volatile organic compounds (VOCs), and polynuclear aromatic hydrocarbons (PAHs) in soil and groundwater at concentrations above the Ministry of the Environment (MOE) standards.

A hydrogeologic site investigation completed by Gartner Lee Limited (now AECOM) in 1998 identified several locations where groundwater and soil concentrations exceeded the applicable standard for zinc, lead, PHCs, VOCs, and PAHs. Based on the findings of the 1998 investigation, additional boreholes were drilled, monitoring wells installed, hydraulic testing, and groundwater monitoring was completed at the western portion of 490 York Road in 2004. Results demonstrated that concentrations of trichloroethylene (TCE) and various petroleum hydrocarbons (PHCs) above the MOE standards continued to be present in the soil and groundwater at the Site (GLL, 2004). The report also concluded that the TCE concentrations found on Site were likely coming from the general vicinity of well nest OW30, located at 490 York Road.

A Phase I and Phase II Environmental Site Assessment, and a Remedial Action Plan (RAP) were completed in 2007 by Decommissioning Consulting Services Limited (DCS). The RAP recommended several potential remedial options, one of them included conducting a risk assessment (RA) for industrial/commercial/community use, and to sever the property to allow for more immediate usage where contamination is no longer present or that an RA determines to be acceptable.

Semi-annual groundwater monitoring and quarterly water levels have been obtained by AECOM since 1998. In 2010 the groundwater monitoring events occurred in March and October and groundwater levels were recorded in June and December. This report presents results from all groundwater monitoring that occurred in 2010.

2. Geologic Setting

The surficial geology of the Site is comprised of fill material that is approximately 1.4 m to 3.2 m in thickness and includes foundry sand and slag, underlain by native silty fine sand till, underlain by dolostone bedrock. The sand layer ranges in thickness from 0.5 m in the western portion of the property to 3.1 m in the southeastern portion of the property. The upper portion of the dolostone bedrock is considered to be highly fractured and therefore porous. The depth of bedrock ranges from 1.4 m (at OW2) to 3.2 m (OW18-II) below ground surface. The average hydraulic conductivity measured in the shallow monitoring wells ranges from 3.2×10^{-6} m/s to 2.5×10^{-4} m/s. The hydraulic conductivity for the monitoring wells screened in bedrock is approximately 5.0×10^{-6} m/s.

Monitoring wells installed at the Site are completed into two groundwater zones (shallow and deep) that appear to have differing groundwater chemistry. The shallow zone is composed of overburden and shallow, highly fractured bedrock. The deep zone is composed of deeper more competent bedrock at a depth of at least 1.5 m below grade.

3. Methods

Prior to commencing groundwater monitoring events and recording water levels, the monitoring wells were opened and allowed to equilibrate with atmospheric pressure. This was completed to ensure that water level measurements were representative of the hydraulic head in the respective wells. Groundwater and product levels were collected using an electronic interface level tape. The interface tape was decontaminated between each well with a liquinox and water solution, followed by methanol, and rinsed with distilled water. Groundwater monitoring occurred March 23 to 24 and October 6 to 7. Groundwater levels were also recorded June 6 and December 9, 2010.

Groundwater levels were measured from the top of the monitoring pipe, at all accessible monitoring wells at the Site, along the property boundary, on Beverly Road, at 490 York Road, along the CP Railway, and on Simcoe Street. Groundwater levels were all converted to an elevation in meters above sea level (masl) using reference elevations. The following monitoring wells were sampled:

Shallow Monitoring Wells: OW2, OW6, OW9-I, OW10, OW11-I, OW12, OW16, OW18-I, OW19, OW22S, OW23S, OW24S, OW25, OW26S, OW27S, OW28S, OW29S, OW30S.

Deep Monitoring Wells: OW9-II, OW11-II, OW13, OW14, OW18-II, OW22D, OW23-D, OW24D, OW25, OW26D, OW27D, OW28D, OW29D, OW30D.

Groundwater samples were collected from each well using dedicated inertial lift valves. During the sampling event, a water quality instrument was used to measure water quality parameters that included pH, specific conductivity and temperature following every well volume that was purged. A groundwater sample was collected following the removal of three well volumes. All purge water was stored in labelled drums for subsequent handling by the City of Guelph.

AECOM staff wore nitrile gloves throughout each sampling event and changed the gloves between each monitoring well location.

Groundwater samples were submitted to MAXXAM Analytics (MAXXAM) under a chain of custody (CoC) protocol and analyzed for parameters listed in Table B-1. Groundwater chemistry results were compared to the standards published in Ontario Regulation 153/09 *Table 2 (potable groundwater), in an Industrial/Commercial/Community property use with coarse textured soils* (herein referred to as the “applicable standard”).

A composite waste water sample was collected and submitted after the completion of the March 2010 sampling event to be compared to the City of Guelph Sanitary Sewer By Law. Results from the composite waste water sampled were above the Guelph Sanitary Sewer By Law limits, therefore the water was removed from the site by a certified waste hauler for both monitoring events under the City of Guelph Generator Number ON3323094.

4. Monitoring Results

4.1 Groundwater Flow

Regional topography is characterized by broad, oval-shaped rolling hills separated by poorly drained valleys, with local relief, generally less than 15 m, towards the south. The Site is approximately 800 m north of the Eramosa River and the topography gradually slopes towards the river.

Groundwater contour maps were generated for shallow and deep groundwater zones for each event. Groundwater and interface levels are presented in Table A-1. Potentiometric contour maps representing groundwater flow at the Site are included in Figure 2 and 3. Groundwater flow in the shallow aquifer continues to be in a south to south-western direction, towards the Eramosa River. The groundwater elevations recorded in the deep monitoring wells are essentially the same across the Site, indicating there is little to no horizontal groundwater flow in the deep bedrock aquifer. These findings are similar to previous years.

Interface measurements were detected as a light non-aqueous phase liquid (LNAPL) at OW23S, and ranged between 0.06 m to 0.15 m thickness for the four monitoring events in 2010.

Vertical groundwater gradients are downward across the study area. A 2004 report by Gartner Lee Limited indicated that Holody Electro Plating is located approximately 500 m to the northeast has a large capacity industrial well, and the water takings (which is currently unknown) may locally influence groundwater flow in the deep bedrock zone.

4.2 Groundwater Chemistry Results

Groundwater chemistry results are included in Appendix B from the 2010 monitoring events. Historical concentration figures for selected metals, volatile organic compounds (VOCs) polyaromatic hydrocarbons (PAHs), petroleum hydrocarbons (PAHs), and polychlorinated biphenyls (PCBs) are presented in Figures 4 through 8.

4.2.1 Inorganic Parameters

Inorganic groundwater results were within the applicable standard during the 2010 monitoring events with the exception of sodium, zinc, and chloride at certain locations.

Chloride concentrations were above the applicable standard at OW29S (1,490 mg/L) and OW30S (1,610 mg/L) in March 2010. Elevated chloride concentrations are likely attributed to road salt applied to the roads in the area.

Concentrations of sodium were above the applicable standard of 490 mg/L in March 2010 at OW29S (780 mg/L) and OW30S (820 mg/L), and are likely a result of road salt application. Historically OW29S and OW30S have occasionally had concentrations of sodium above the applicable standard.

Zinc concentrations were above the applicable standard of 1,100 µg/L at the following locations in March and September 2010, respectively;

- OW6 (3,500 µg/L, 2,300 µ/L)
- OW13 (1,700 µg/L, 1,900 µg/L)
- OW14 (1,300 µg/L, 3,700 µg/L)
- OW18-I (1,300 µg/L, 1,600 µg/L)
- OW19 (4,500 µg/L, 3,300 µg/L)
- OW22S (2,600 µg/L March 2010)

The inorganic results were consistent with 2009 data.

Historically exceedances of lead have been reported at OW16 and OW9-II, however concentrations were below the applicable standard in 2010. Arsenic was reported to be above the applicable standard during initial investigations in 1998, however concentrations have been at or near the laboratory detection limit for over 5 years. All other monitoring wells sampled for inorganic parameters during the program were below the applicable standard.

4.2.2 Volatile Organic Compounds (VOCs)

VOCs of concern at, and within the vicinity of, the Site are trichloroethylene (TCE) and its respective degradation products including *cis-1,2*-dichloroethylene (cis-1,2-DCE), 1,1-dichloroethylene (1,1-DCE) and vinyl chloride (VC). 1,1,1-TCA has also been detected above the applicable standard.

TCE concentrations were above the applicable standard at several monitoring wells primarily located at the eastern portion of the Site and 490 York Street. Monitoring wells that exceeded the applicable standard for TCE in March and September 2010, respectively included;

- OW18-I (20 µg/L, 14 µg/L)
- OW23D (2 µg/L, 1.9 µg/L)
- OW24D (2,700 µg/L, 3,500 µg/L)
- OW28S (7.3 µg/L, 140 µg/L)
- OW29S (130 µg/L, 200 µg/L)
- OW30S (830 µg/L, 820 µg/L)
- OW18-II (2.7 µg/L, 2.1 µg/L)
- OW24S (85 µg/L, 78 µg/L)
- OW27S (10 µg/L, 12 µg/L)
- OW28D (13 µg/L, 27 µg/L)
- OW29D (1,000 µg/L, 1,100 µg/L)
- OW30D (4,900 µg/L, 6,100 µg/L)

TCE concentrations for selected monitoring wells are depicted in Appendix B. TCE concentrations in 2010 were generally higher at deep monitoring wells than at shallow locations. Also, TCE at the shallow monitoring wells generally appears to decreasing in concentration. The presence of downward gradients at the eastern portion of the Site along with the trend of increasing TCE concentration in the deeper (bedrock) aquifer suggests that TCE is migrating from the shallow aquifer to the deeper (bedrock) aquifer in this area of the Site.

The highest concentrations of TCE observed in 2010 were 6,000 µg/L at OW30D (located at 490 York Road) and 3,500 µg/L at OW24D (located at the eastern portion of the Site). The deeper zone at the eastern portion of the Former IMICO Site groundwater flows northeast (from OW24D to OW30D), and historical concentrations of TCE were the highest at well nest OW30.

1,1-DCE, cis-1,2-DCE, trans-1,2-DCE, and VC were detected in several monitoring wells across the study area above the applicable standard at locations that historically had detections of TCE or are located downgradient of monitoring wells with detections of TCE. Dechlorination of TCE can occur by anaerobic biodegradation and abiotic degradation, as described by Wiedemeier *et al.* (1998) and Vogel *et al.,*(1987). Primary indicators of reductive dechlorination are the detection of degradation products of TCE which include DCE isomers, and VC. These compounds will degrade to final products including ethene, ethanol, and/or carbon dioxide. The presence of compounds such as 1,1-DCE, cis-1,2-DCE and VC indicate that degradation of TCE is occurring at the Site.

1,1,1-TCA was only detected at OW12 in October 2010 at a concentration of 13 µg/L (May 2010) and 31 µg/L (October 2010), which is below the applicable standard.

Overall VOC concentrations were consistent with September 2009 results. Current and historical TCE and 1,1,1-TCA, and their primary degradation products are presented in Figure 5. Analytical results from 2010 are included in Appendix B.

Time concentration plots for selected monitoring wells including OW18, OW24, OW28, OW29 and OW30 are presented in Appendix B. Concentrations of TCE have stabilized over time at OW18-I, OW18-II, OW24S, OW28S, OW29S, OW29D, OW30S. At OW24D TCE concentrations overall have decreased since 2005, and were higher during the fall monitoring events in 2009 and 2010. At OW28S, TCE concentrations ranged from 13µg/L to 140 µg/L in 2010, and concentrations were historically highest during the fall events since 2008.

Benzene, methlyene chloride and xylene have also historically been detected above the applicable standard, however concentrations have been at or near the laboratory detection limit across the Site since 2005.

4.2.3 Polyaromatic Hydrocarbons (PAHs)

PAHs were below the applicable standard at most monitored locations at and within the vicinity of the Site in 2010. However, benzo(g,h,i)perylene, benzo(k)fluoranthene, chrysene, fluoranthene and indeno(1,2,3-cd)pyrene at OW30S were detected above the applicable standard, in March 2010. At OW29S benzo(k)fluoranthene was above the applicable standard also in March 2010. Benzo(a)pyrene was detected above the applicable standard of 0.01 μg/L at the following locations:

- OW28S (0.02 µg/L March 2010)
- OW29S (0.19 µg/L March 2010)
- OW30S (0.72 µg/L March 2010, 0.04 µg/L October 2010)
- OW30D (0.02 µg/L October 2010)

Concentrations of PAHs at monitored locations of the Site have been decreasing since 2005. A summary of current and historical PAH concentrations is presented in Figure 6, and Appendix B.

4.2.4 Petroleum Hydrocarbon Compounds (PHC)

A summary of current and historical PHC concentrations are provided in Figure 7. Most monitoring wells sampled for PHCs were below the reportable detection limit, results are included in Appendix B. OW25 had concentrations of F2 at 190 μg/L and F3 at 3,300 μg/L which are above the applicable standard of 150 µg/L and 500 µg/L, respectively. OW30D had concentrations of F1 and F1-BTEX at 1,000 μg/L, above the applicable standard of 750 µg/L. OW29D, OW30S and OW24D had detectable concentrations above the laboratory reportable detection limit of F1, F1-BTEX at the southeastern portion of the Site and at the 495 York Road property, which is consistent with historical concentrations.

4.2.5 Polychlorinated Biphenyls (PCBs)

PCBs have been sampled at OW29S and OW29D annually, due to historical detections of PCBs. In 2010, PCBs were below the laboratory detection limit at both locations, and have been below the detection limit since around 2005. PCBs appear to be no longer a contaminant of concern at the Site.

4.3 QA/QC

In order to assess field techniques and/or laboratory precision, blind duplicate samples were collected during each groundwater monitoring event. The relative percentage difference (RPD) between the samples collected for each monitoring well were calculated and were within +/- 40% and therefore AECOM considers there to be good reliability in the data. Results for RPD on duplicates collected in 2010 are presented in Table B-2.

At each monitoring event a water sample was prepared by MAXXAM to determine if samples may be impacted during travel to the lab (trip blank). The trip blank was analyzed for VOCs and no detectable concentrations resulted.

5. Conclusions

The following was concluded from results during the 2010 groundwater monitoring at and within the vicinity of the Site;

a) Consistent with historical data, shallow groundwater flow direction is in a south to southwestern direction from the northern portion of the property. Deep groundwater flow direction is slightly to the north-northeast, however gradients are near zero. Vertical hydraulic gradients in the shallow zone are generally downward.

b) Zinc concentrations continue to be above the applicable standard at monitoring wells towards the west portion of the Site. Other metals including arsenic, and lead are below the reportable detection limit and are no longer contaminants of concern at the Site.

c) Overall TCE concentrations appear to be decreasing where concentrations are detected. The highest TCE concentrations were 6,000 µg/L at OW30D (located at 490 York Road) and 3,500 µg/L at OW24D (located at the eastern portion of the Site).

d) PAH concentrations were below the applicable standard at all wells located at the Site, except for four located at the 490 York Road property.

e) Five monitoring wells had PHC concentrations above the applicable standard located at the Site, and at the 490 York Road property.

f) PCB concentrations have been below the detection limit at monitored locations since 2005. PCBs are no longer a contaminant of concern at the Site.

6. Recommendations

AECOM recommends that the City of Guelph continue the semi-annual groundwater monitoring events in 2011.

Groundwater elevations should be collected semi-annual as compared to quarterly in 2010. This is recommended based on consistent groundwater elevation and flow trends from year to year.

The monitoring wells that AECOM recommends be abandoned and the rationale is provided in Table 2.

Table 1. Recommended Monitoring Wells for Decommissioning and Rational

Recommended for Decommissioning	Rational
• **OW14** • **OW4** • **OW13**	• OW9-I and OW9-II could be used as a representative well nest within 10 m of the listed wells to monitor groundwater chemistry in this area of the site
• **OW10** • **OW07-35**	• OW26S and OW26D are currently monitored and near OW10 and OW07-35. AECOM believes that monitoring OW26S and OW26D should sufficiently monitor groundwater at the southern portion of the Site.
• **OW07-34S**	• OW25 is currently and historically has been monitored regularly and is near OW07-34S. OW25 and OW07-34D could be paired.
• **OW11-I** • **OW11-II** • **OW12** • **OW5** • **OW15**	• Groundwater chemistry indicates that contamination is not present at the eastern portion of the Former IMICO Site. OW16 is and historically has been monitored and is representative of the shallow groundwater in the eastern portion of the Site
• **OW17** • **OW07-38** • **OW07-31**	• Monitoring wells are currently not monitored and OW2 is considered to provide representative data for the northern portion of the Site.
• **OW07-37** • **OW07-33** • **OW07-32**	• OW3-I and OW3-II would be suitable to monitor groundwater within the center of the Site, contingent on assessing their current condition since they have not been monitored recently.

During groundwater monitoring activities during 2010 AECOM noted the following monitoring wells that require maintenance:

- OW5, OW07-36S, OW07-36D, OW30S, and OW30D.

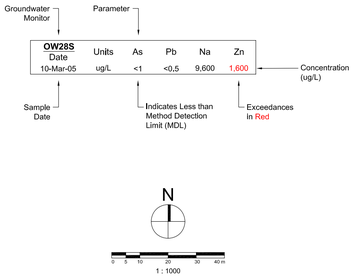
OW22S 2010 ANALYTICAL RESULTS ABOVE MOE STANDARDS (2009)

SHALLOW GROUNDWATER FLOW DIRECTION

Concentrations in RED denote an exceedance of the MOE Table 2 Standards for coarse grain soil. The Table 2 Standards for the parameters presented in this figure are shown:

Parameter	Concentration	Units
Arsenic (As)	25	as noted
Lead (Pb)	10	ug/L
Sodium (Na)	490,000	ug/L
Zinc (Zn)	1,100	ug/L



DO NOT SCALE THIS DOCUMENT.
ALL MEASUREMENTS MUST BE OBTAINED FROM STATED DIMENSIONS.

OW27S 2010 ANALYTICAL RESULTS ABOVE MOE STANDARDS (2009)

SHALLOW GROUNDWATER FLOW DIRECTION

Concentrations in RED denote an exceedance of the MOE Table 2 Standards for coarse grain soil. The Table 2 Standards for the parameters presented in this figure are shown:

Parameter	Concentration	Units
TCE	0,1	ug/L
1,1-DCE	1,6	ug/L
cis-1,2-DCE	0,2	ug/L
1,1,1-TCA	2,4	ug/L
1,1-DCA	1	ug/L
VC	0,1	ug/L

Notes:
BTOP - Below top of pipe.
m ASL = metres above sea level.
Measuring Point Elevation - Top of riser pipe.
Survey completed by The City of Guelph on March 12, 2004.
NA = Not Available = --.

General Chemistry : pH, Conductivity, Alkalinity
Major Ions: Fluoride, Chloride, Nitrate, Nitrite, Bromide, Phosphate, Sulfate, Ca, K, Mg, Na
Metals: As, Pb, Zn
VOCs: 624 EPA
SVOCs: PAHs
TPH: Heavy Oils and Gas/Diesel
* reduced scope to include one sample for PCBs per year for each well indicated.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.
* Results relate only to the items tested.

(1) Values for calculated parameters may not appear to add up due to rounding of raw data and significant figures.

Client Project #: IMICO Sept. Sampling
Project name: IMICO SITE

GENERAL COMMENTS

VOC Analysis: Due to high concentrations of target analytes and or foaming, some samples required dilution. Detection limits were adjusted accordingly.

PAH Analysis :Samples were decanted prior to extraction with the client's permission.
F1 BTEX Analysis: The BTEX results used for the F1-BTEX calculation were obtained from Headspace-GC analysis.

Sample HL5664-01: F2 F4 Analysis : Sample was decanted prior to analyses according to client request.

QUALITY ASSURANCE REPORT

			Matrix Spike		Spiked Blank		Method Blank		RPD		QC Standard	
QC Batch	Parameter	Date	% Recovery	QC Limits	% Recovery	QC Limits	Value	Units	Value (%)	QC Limits	% Recovery	QC Limits
2299092	F1 (C6-C10) - BTEX	2010/10/15					<100	ug/L	NC	40		
2301175	Dissolved Sodium (Na)	2010/10/18	NC	80 - 120	105	90 - 110	<100	ug/L	3.9	25		

N/A = Not Applicable
RDL = Reportable Detection Limit
RPD = Relative Percent Difference
Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.
Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.
QC Standard: A blank matrix to which a known amount of the analyte has been added. Used to evaluate analyte recovery.
Spiked Blank: A blank matrix to which a known amount of the analyte has been added. Used to evaluate analyte recovery.
Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.
Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.
NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spiked amount was not sufficiently significant to permit a reliable recovery calculation.
NC (RPD): The RPD was not calculated. The level of analyte detected in the parent sample and its duplicate was not sufficiently significant to permit a reliable calculation.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) Values for calculated parameters may not appear to add up due to rounding of raw data and significant figures.

Package 1	2.3°C
Package 2	1.0°C
Package 3	2.0°C
Package 4	0.7°C
Package 5	1.7°C

Each temperature is the average of up to three cooler temperatures taken at receipt

GENERAL COMMENTS

VOC Analysis: Due to high concentrations of target analytes, some samples required dilution. Detection limits were adjusted accordingly.

F1-BTEX Analysis:The BTEX results used for the F1-BTEX calculation were obtained from Headspace-GC analysis.

Revised report: Reg 153 Criteria added as per client request.

Sample FK5207-01: Nitrite/Nitrate: Due to the sample matrix, sample required dilution. Detection limit was adjusted accordingly.

VOC Analysis: Due to a level of petroleum hydrocarbon compounds beyond the appropriate range, the sample required dilution. The detection limits were adjusted accordingly.

Sample FK5208-01: VOC Analysis: Due to foaming, sample required dilution. The detection limits were adjusted accordingly.

Results relate only to the items tested.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.
Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.
QC Standard: A blank matrix to which a known amount of the analyte has been added. Used to evaluate analyte recovery.
Spiked Blank: A blank matrix to which a known amount of the analyte has been added. Used to evaluate analyte recovery.
Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.
Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.
NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spiked amount was not sufficiently significant to permit a reliable recovery calculation.
NC (RPD): The RPD was not calculated. The level of analyte detected in the parent sample and its duplicate was not sufficiently significant to permit a reliable calculation.
(1) The recovery was below the lower control limit. This may represent a low bias in some results for this specific analyte.
(2) Duplicate results exceeded RPD acceptance criteria. This may be due to the observed differences in the contents of the containers supplied. The variability in the results for this analyte may be more pronounced.

Validation Signature Page

Maxxam Job #: B035447

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

YUAN ZHOU, gc\ms Technician

SUZANA POPOVIC, Supervisor, Hydrocarbons

MEDHAT RISKALLAH, Manager, Hydrocarbon Department

CRISTINA CARRIERE, Scientific Services

==========

Maxxam has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per section 5.10.2 of ISO/IEC 17025:2005(E), signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

Package 1	4.0°C
Package 2	6.0°C
Package 3	3.3°C

Each temperature is the average of up to three cooler temperatures taken at receipt

GENERAL COMMENTS

VOC Analysis: Due to high concentrations of target analytes, some samples required dilution. Detection limits were adjusted accordingly.

Revised report: Reg 153 Criteria added as per client request.

Sample FK5261-01: F1/BTEX Analysis: The BTEX results used for the F1-BTEX calculation were obtained from Headspace-GC analysis.

Results relate only to the items tested.

		Spiked Blank	Orthophosphate (P)	2010/03/31		100	%	80 - 120
		Method Blank	Orthophosphate (P)	2010/03/31	0.02, RDL=0.01		mg/L	
		RPD	Orthophosphate (P)	2010/03/31	NC		%	25

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.
Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.
QC Standard: A blank matrix to which a known amount of the analyte has been added. Used to evaluate analyte recovery.
Spiked Blank: A blank matrix to which a known amount of the analyte has been added. Used to evaluate analyte recovery.
Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.
Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.
NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spiked amount was not sufficiently significant to permit a reliable recovery calculation.
NC (RPD): The RPD was not calculated. The level of analyte detected in the parent sample and its duplicate was not sufficiently significant to permit a reliable calculation.

Package 2	3.7°C
Package 3	0.7°C
Package 4	4.7°C

Each temperature is the average of up to three cooler temperatures taken at receipt

GENERAL COMMENTS

F1BTEX Analysis: The BTEX results used for the F1-BTEX calculation were obtained from Headspace-GC analysis.

Revised report: Reg 153 Criteria added as per client request.

Results relate only to the items tested.

Quality Assurance Report (Continued)

Maxxam Job Number: MB036036

QA/QC Batch Num	Init	QC Type	Parameter	Date Analyzed yyyy/mm/dd	Value	Recovery	Units	QC Limits
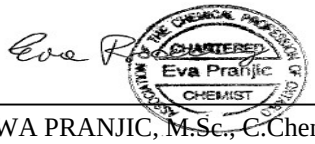
2113033	ZZ	Method Blank	Diesel (C10-C24)	2010/03/31	<100		ug/L	
		RPD	F2 (C10-C16 Hydrocarbons)	2010/03/31	NC		%	50
			F3 (C16-C34 Hydrocarbons)	2010/03/31	NC		%	50
			F4 (C34-C50 Hydrocarbons)	2010/03/31	NC		%	50

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.
Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.
QC Standard: A blank matrix to which a known amount of the analyte has been added. Used to evaluate analyte recovery.
Spiked Blank: A blank matrix to which a known amount of the analyte has been added. Used to evaluate analyte recovery.
Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.
Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.
NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spiked amount was not sufficiently significant to permit a reliable recovery calculation.
NC (RPD): The RPD was not calculated. The level of analyte detected in the parent sample and its duplicate was not sufficiently significant to permit a reliable calculation.
(1) The recovery was above the higher control limit. This may represent a high bias in some results for this specific analyte.
(2) Detection Limit was raised due to matrix interferences.

Validation Signature Page

Maxxam Job #: B036036

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).



EWA PRANJIC, M.Sc., C.Chem, Scientific Specialist

YUAN ZHOU, gc\ms Technician

SUZANA POPOVIC, Supervisor, Hydrocarbons

CHARLES ANCKER, B.Sc., M.Sc., C.Chem, Senior Analyst

MEDHAT RISKALLAH, Manager, Hydrocarbon Department

==========

Maxxam has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per section 5.10.2 of ISO/IEC 17025:2005(E), signing the reports. For Service Group specific validation please refer to the Validation Signature Page.
