# EXECUTIVE SUMMARY

RWDI was retained by FCHT Holdings (Ontario) Corporation, a subsidiary of First Capital REIT, to prepare a Noise and Vibration Impact Study for the proposed development located at 1 Clair Road East in Guelph, Ontario. The proposed development will consist of 4 blocks of mixed-use buildings. This assessment was completed to support the Official Plan and Zoning By-Law Amendment (OPA/ZBA) submissions as required by the City of Guelph.

The following noise control measures are recommended for the proposed development:

- 1. Installation of central air-conditioning so that all suites' windows can remain closed.
- 2. The inclusion of noise warning clauses related to:
  - a. Transportation sound levels at the building façade and in the outdoor amenity areas
  - b. Proximity to commercial/industrial land use
- 3. Minimum sound isolation performance:
  - a. Suite window glazing with minimum sound isolation performance up to STC-29 for certain façade of the podiums of Blocks C and D and Tower D, as detailed herein.
- 4. Construction of perimeter noise barriers along some outdoor amenity areas, if feasible, to address transportation noise. Otherwise, the applicable warning clause should be included.
- 5. Construction of perimeter noise barriers for the west outdoor amenity area on the podium of Tower D and to its north to address surrounding stationary sources of noise.
- 6. Apply offsite on-source mitigation for the HVAC equipment associated with the commercial plaza to the immediate west, as detailed herein.

The potential noise levels from stationary sources of sound were investigated. Based on the noise modeling results and setback distances, the land use compatibility of the proposed development with respect to the nearby industrial land uses is considered acceptable from the noise assessment perspective with implementation of mitigation measures for adjacent stationary sources. Due to the proximity of the proposed development to commercial facilities, a warning clause is recommended to inform prospective occupants of the potential for audible noise from these facilities. Moreover, offsite on-source mitigation is required for the HVAC equipment associated with the commercial plaza, to the immediate west, as discussed in the study.

At this stage in design, the noise levels produced by the development on itself and its surroundings could not be quantitatively assessed. However, the effect on both the building itself and its surroundings is expected to be feasible to meet the applicable criteria. We recommend that the building design is evaluated prior to building permit to ensure that the acoustical design is adequately implemented in order to meet the applicable criteria.

Based on the results of the analysis, including implementation of the recommendations included with this assessment, the proposed development is feasible to meet the applicable sound and vibration criteria.

# 1 INTRODUCTION

RWDI was retained by FCHT Holdings (Ontario) Corporation, a subsidiary of First Capital REIT, to prepare a Noise and Vibration Impact Study for the proposed development located at 1 Clair Road East in Guelph, Ontario. The proposed development will consist of 4 blocks of mixed-use buildings. The context site plan is shown in **Figure 1**.

The site is exposed to noise from road traffic from Clair Road to the north, Hawkins Drive to the east, Poppy Drive to the south, Farley Drive and Gordon Street to the west.

The nearest operational railway is more than 3 kilometres (km) to the east of the proposed development. The assessment of noise and vibration from the rail is not required per the Railway Association of Canada's Guidelines for New Development in Proximity to Railway Operations (RAC, 2013).

The development is surrounded by residential and commercial buildings in all directions, with no significant industrial facilities in the surrounding area within 1 km radius. A noise assessment of nearby stationary sources associated with commercial uses was conducted for buildings located within 70 m of the development, which aligns with the zone of influence for light Class I facilities as per Ontario Ministry of the Environment, Conservation and Parks (MECP) Guideline D-6 (MOE, 1995). Moreover, a car wash at approximately 120 m setback to the west was also included to assess for any potential sound impacts.

This assessment was completed to support the Official Plan and Zoning By-Law Amendment (OPA/ZBA) submissions as required by the City of Guelph. This assessment was based on design drawings received on and before December 12, 2023. A copy of the drawings is included in **Appendix A**.

# 2 APPLICABLE CRITERIA

Applicable criteria for transportation noise sources (road) and stationary noise sources are adopted from the MECP NPC-300 Environmental Noise Guideline (MOE, 2013) and from the Guelph Noise Control Guidelines (GNCG) (Guelph, 2018), with a summary of the applicable criteria included with **Appendix B**.

The proposed development site would be characterized as a "Class 1 Area", which is defined according to NPC-300 as an area with an acoustical environment typical of a major population centre, where the background sound level is dominated by the activities of people, usually road traffic, often referred to as "urban hum."

## 3 SITE VISIT

A site visit was conducted by RWDI on November 30, 2023 to obtain a better understanding of the acoustic environment of the area and to take measurements and gather information regarding stationary sources located on adjacent rooftops to the west of the proposed development. During the site visit, an audible "urban hum" was noted, which is characteristic of a Class 1 Area.

# 4 THE EFFECTS OF THE ENVIRONMENT ON THE PROPOSED DEVELOPMENT

## 4.1 Transportation Source Assessment

## 4.1.1 Road Traffic Volume Data

Traffic data was obtained for Clair Road and Gordon Street from the City of Guelph as Automatic Traffic Recorders (ATRs), including hour-by-hour counts over the period of approximately 1 week, including vehicle classification breakdowns.

The average 24-hour total volumes over the monitoring period of the ATR data were assumed representative of the Annual Average Daily Traffic (AADT) volumes for each road, as indicated by the City of Guelph data. The average heavy vehicle breakdown and the average daytime/nighttime split were applied based on the ATR data for each of the respective roadways.

ATR data was not available for Farley Drive, Hawkins Drive, or Poppy Drive; however, Turning Movement Counts (TMCs) were provided by the City of Guelph for the intersections of Clair Road at Farley Drive, and Hawkins Drive at Poppy Drive. The TMCs were used to determine the traffic volume and types of vehicles on each link during the AM peak, PM peak, and 8-hour interval, which were assumed to be 9%, 10% and 60% of the Annual Average Daily Traffic (AADT), respectively. These typical percentages for traffic distribution were in fair agreement with the ATR data for Clair Road and Gordon Street. A medium-to-heavy vehicle ratio of 1:1 was applied to the total heavy vehicle volumes provided in the TMCs based on the trends observed in the ATR data for Clair Road and Gordon Street.

Traffic volumes were increased at a conservative annual growth rate of 2% per year to a future horizon year of 2041.

A summary of the traffic data used is included in **Table 1** below, with more detailed information included in **Appendix C**.

Roadway	2041 Future Traffic (AADT)	% Day/Night	Speed Limit (km/hr.)	% Medium Trucks	% Heavy Trucks
Gordon Street	24,061	90% /10%	60	3.9%	3.8%
Clair Road East	17,060	92% / 8%	60	3.1%	2.4%
<b>Farley Drive</b>	6,738	90% / 10%	40	4.9%	4.9%
Hawkins Drive	1,390	90% / 10%	40	2.2%	2.2%
Poppy Drive East	2,810	90% / 10%	40	2.1%	2.1%

#### **Table 1: Road Traffic Volumes**

## 4.1.2 Representative Receptors

The selection of receptors affected by transportation noise sources was based on the drawings reviewed for this assessment. Using the "building evaluation" feature of Cadna/A, each façade of the residential buildings was assessed. Commercial uses on the ground floor of Blocks C and D were excluded from the current assessment.

Outdoor Living Areas (OLAs) would include outdoor areas intended and designed for the quiet enjoyment of the outdoor environment and which are readily accessible from the building. OLAs may include any common outdoor amenity spaces associated with a multi-unit residential development (e.g. courtyards, rooftop terraces), and/or private backyards and terraces with a minimum depth of 4m provided they are the only outdoor living area for the occupant.

Daytime sound levels were assessed at the following identified OLAs:

- OLA\_01a through OLA\_01e: Southeast Block A At-grade Outdoor Amenity
- OLA\_02a through OLA\_02c: Southwest Block B At-grade Outdoor Amenity (South Amenity)
- OLA\_03a through OLA\_03c: Southwest Block B At-grade Outdoor Amenity (West Amenity)
- OLA\_04a and OLA\_04b: Northwest and Northeast Blocks At-grade Outdoor Amenity
- OLA\_05: Northeast Block C Level 7 Outdoor Amenity
- OLA\_06: Southeast Block A Level 7 Outdoor Amenity
- OLA\_07a and OLA\_07b: Southwest Block B Level 7 Outdoor Amenity
- OLA\_08: Northwest Block D Level 7 Outdoor Amenity (West Amenity)
- OLA\_09: Northwest Block D Level 7 Outdoor Amenity (East Amenity)

The OLAs are indicated in **Figure 2**.

## 4.1.3 Analysis and Results

Sound levels due to the adjacent transportation (road) sources were predicted using emission algorithms from the Ontario Road Noise Analysis Method for Environment and Transportation (ORNAMENT) guidelines implemented in the Cadna/A noise modeling software as line sources. A sample modeling output file is included in **Appendix C** for the north façade of the northwest block D at the worst-case receptor location at the height of 4.5m above ground. Moreover, a comparison is included between the STAMSON modeled impacts and the Cadna/A modeled impacts. The predicted Cadna/A sound levels are in fair agreement with those calculated in STAMSON.

To assess the effect of transportation noise on suites, the maximum sound level on each façade was determined with the results summarized in **Table 2**.

2.

Applicable for low and medium-density developments: Provision for future installation of air-conditioning with a warning clause. Refer to **Appendix D** for guidance regarding air-conditioning as a noise mitigation measure.

The acoustical performance of building components must be specified to meet the indoor sound level criteria. Installation of air conditioning to allow for windows and doors to remain closed, with a warning clause. Refer to **Appendix D** for guidance regarding air-conditioning as a noise mitigation measure.

To assess the effect of transportation noise on the qualifying OLAs for development, predicted sound level results are summarized in **Table 3**.

Note(s): 1.

2

The predicted sound level meets the NPC-300 and GNCG criterion for OLAs. Noise control measures are not required. For OLA sound levels >55 dBA and ≤60 dBA, noise controls may be applied to meet the 55 dBA criterion. If noise control measures are not provided, a warning clause is recommended.

## 4.2 Stationary Source Assessment

Stationary sources could be grouped into two categories: Those that have a permit with the Ontario Ministry of the Environment, Conservation and Parks (MECP) through an Environmental Compliance Approval (ECA) or Environmental Activity and Sector Registry (EASR) and those that are exempt from ECA or EASR permit requirements.

In the case where a stationary source has an Environmental Compliance Approval (ECA) or Environmental Activity and Sector Registry (EASR) permit with the MECP, and would be put in a position where it is no longer in compliance with the applicable sound level criteria due to the encroachment of the proposed new development, source-specific mitigation and/or formal classification of the proposed development lands as a "Class 4 Area" (refer to C.4.4.2 "Class 4 Area" in NPC-300) would be required. In this case, coordination and agreements between the stationary source owner, proposed new development owner, the land-use planning authority and potentially the MECP would be needed.

In the case where a stationary source is exempt from ECA or EASR permit requirements with the MECP, the noise provisions of the applicable Municipal Code / Noise By-Law and guidance from NPC-300 would be applicable. In this case, mitigation of sound levels due to stationary sources would be to meet the applicable sound level criteria, and to avoid nuisance complaints from future occupants of the proposed new development.

December 12, 2023

<u> K</u>

## 4.2.1 Land-Use Compatibility Review (D-6 Guideline Assessment)

The MECP Guideline D-6 (MOE, 1995) was used as a tool to classify the identified industries and asses their potential influence on the proposed development. The classifications and setback guidelines are summarized in **Appendix B**.

None of the buildings considered in this assessment currently have an environmental permit (ECA or EASR), nor are they required to obtain one. Therefore, the conversion of mixed-use zoning to residential is not anticipated to affect any environmental approvals. Potential noise was assessed from surrounding commercial buildings was completed to avoid nuisance complaints from occupants of the proposed new development.

#### 4.2.1.1 Class III Industries

No facilities within the 1000m radius of the proposed development were identified as Class III.

#### 4.2.1.2 Class II Industries

No facilities within the 300m radius of the proposed development were identified as Class II.

#### 4.2.1.3 Class I Industries

The development is surrounded by residential and commercial buildings in all directions. For this assessment, stationary sources from the surrounding commercial/retail and residential buildings are included in this assessment, based on a 70 m separation distance from the proposed development. Moreover, a car wash at approximately 120 m setback to the west was also included to assess for any potential sound impacts.

## 4.2.2 Stationary Source Modeling

Stationary sources of noise surrounding the proposed development were identified using a combination of source identification during a site visit conducted by RWDI on November 30, publicly available aerial and street-level imagery, and business listing. Non-permitted commercial/retail and residential buildings within a 70m setback of the proposed development are included in the assessment, in addition to a car wash at approximately 120 m setback to the west.

#### 4.2.2.1 Representative Receptors

As with the transportation assessment, the selection of receptors affected by stationary sources was based on the drawings reviewed for this assessment. The worst-case receptor locations were assessed to evaluate the potential stationary source noise effects on the proposed development.

Outdoor points of reception (OPORs) for noise from stationary sources were assessed at the worst-case location within each OLA included in the transportation noise modelling and indicated in Section 4.1.2.

#### 4.2.2.2 Assumed Sources and Sound Power Levels

During the site visit conducted by RWDI on November 30, 2023, rooftops of the 2 Pergola Commons shopping center buildings and the Keg located directly to the west of the proposed development were accessed to take measurements and to obtain accurate information regarding model numbers and source locations. Manufacturer data was used to obtain sound power levels for most of the rooftop equipment, as HVAC equipment was not operating at full cooling capacity during the site visit. Measurements were used for sound power levels of the rooftop equipment that was operating normally during the site visit, such as exhaust fans and makeup air units. RWDI proxy data was used for the sound power levels of the stationary sources identified to the north of Clair Road.

The assumed sound power levels included in the stationary source assessment are presented in **Table 4**. The locations of the sources included in the stationary source assessment, summarized in **Table 4**, are illustrated in **Figure 4**.

		Proxy Data / ID Manufacturer Data / Measurement		Duty Cycle		
Source Description	Source ID		Sound Power Level (dBA)	Daytime and Evening (07:00h – 23:00h)	Nighttime (23:00h – 07:00h) <sup>[5]</sup>

#### **Table 4: Stationary Source Sound Power Level Assumptions**

RWDI#2401100 December 12, 2023

				Duty Cycle		
Source Description	Description Source ID Proxy Data / Manufacturer Data / Measurement		Sound Power Level (dBA)	Daytime and Evening (07:00h – 23:00h)	Nighttime (23:00h – 07:00h) <sup>[5]</sup>	
Typical HVAC 1-Fan	HVAC_1F	Proxy Data	82	Continuous	30 minutes/hour	
Typical HVAC 2-Fan	HVAC_2F	Proxy Data	85	Continuous	30 minutes/hour	
Car Wash Entrance and Exit	CarWash	Proxy Data	102 <sup>[4]</sup>	15 minutes/hour	0 minutes/hour	

Note(s):

1. All Lennox HVAC units are LGH series. Sound power levels were assigned for each individual unit based on cooling capacities specified in the manufacturer data sheets.

2. All York HVAC units are ZJ series. Sound power levels were assigned for each individual unit based on cooling capacities specified in the manufacturer data sheets.

3. Sound power level for the ice machine not including the +5 dB correction applied for tonality.

4. Sound power level for the car wash not including the +5 dB correction applied for tonality.

5. Stationary sources associated with the Goodlife Fitness Center were assumed to operate continuously during nighttime hours as the Goodlife is open 24 hours.

The assumed sound power level values and duty-cycles for the stationary sources are based on manufacturer data and reasonable assumptions for the source type. During the site visit, it was noted that there was a sign for the car wash at the Mobil gas station that said the car wash was open 24 hours. However, the City of Guelph Noise By-Law states that the operation of a car wash is not permitted for nighttime period, regardless of the zoning. Therefore, the car wash was not assessed during nighttime hours.

#### 4.2.2.3 Analysis and Results

Stationary source noise modelling was carried out using the Cadna/A software package, a commercially available implementation of the ISO 9613 (ISO, 1994 and ISO, 1996) algorithms. The sound level limits for the worst-case points of reception are the exclusion limits or the ambient due to road traffic, whichever is higher. Road traffic ambient sound levels were calculated for the quietest hour for the daytime and nighttime based on the traffic data obtained from the City of Guelph, applying no growth to the AADT volumes as a conservative approach. The ATR data for Gordon Street and Clair Road included the quietest hour volumes directly. The percentage of road volumes for these two roads was found to be approximately 1.4% and 0.3% of the AADT for Daytime/Evening and nighttime periods, respectively. These percentages were applied to Hawkins Drive, Poppy Drive and Farley Drive.

The predicted sound levels during the worst-case 1-hour from existing stationary sources are presented in **Table 5**. The worst-case facade locations are where the difference between the stationary source noise and predicted background noise is greatest. A sample calculation is included in **Appendix E** for the west façade of the southwest block B 10-storey tower at a worst-case height of 4.5 meters above the 2-storey podium below. The location of the receptor for the sample calculation is illustrated in **Figure 4**.

	Time Period		Sound Level Criteria		
Worst-case Receptor	Daytime- Evening	Nighttime 2300-0700h	Daytime / Nighttime	Notes	
	0700-2300h	[1]	L <sub>EQ-1hr</sub>		
Northeast Block C	51 dBA	47 dBA	50 / 45 dBA	Exceeds Sound Level Criteria	
Southeast Block A	52 dBA	48 dBA	50 / 45 dBA	Exceeds Sound Level Criteria	
Southwest Block B	58 dBA	56 dBA	53 / 45 dBA	Exceeds Sound Level Criteria	
Northwest Block D	58 dBA	54 dBA	54 / 47 dBA	Exceeds Sound Level Criteria	
OPOR_08 Outdoor (Worst- case) <sup>[2]</sup>	58 dBA		53 / dBA	Exceeds Sound Level Criteria	

#### Table 5: Predicted Sound Levels at Worst-case Receptor Locations - Continuous Stationary Sources

Note(s):

1. Outdoor areas are not assessed during the nighttime period.

2. All other outdoor areas meet the applicable sound level limits.

As shown in **Table 5**, the daytime-evening and nighttime continuous sound levels due to existing stationary sources are predicted to exceed the applicable Class 1 sound level criteria. The outdoor point of reception OPOR\_09 is also predicted to exceed the sound level criteria due to stationary source noise. All other outdoor points of reception meet the applicable Class 1 sound level criteria based on noise modelling analysis.

Recommendations to address stationary sound impacts are provided in the next section. Assumptions regarding the duty cycles and the sound power levels for the surrounding stationary sources are conservative. More details should be obtained surrounding the stationary source operation, including summer-time measurements, in the Detailed Design phase before implementing the recommended mitigation measures.

## 4.3 Recommendations

Based on the noise assessment results, the following recommendations were determined for the project. Recommendations are provided for both transportation sources and stationary sources.

## 4.3.1 Transportation Sources

The following recommendations are provided to address transportation sources.

#### 4.3.1.1 Building Façade Components

Due to the elevated transportation sound levels in the area, acoustical design of the façade components, including spandrel, window glazing, and exterior doors, are recommended to be specified for the proposed development.

RWDI#2401100 December 12, 2023

To assess the development's feasibility, preliminary window glazing and exterior balcony door sound isolation requirements were determined. These were based on following assumptions:

- Typical residential living room:
  - Glazing 60% of façade, Door: 20% of façade
  - 55% Façade to floor area Ratio
- Typical residential bedroom:
  - Glazing 80% of façade, Door: N/A
  - 81% Façade to floor area Ratio
- Typical exterior sliding doors meeting approximately STC-25 sound isolation performance
- Typical façade spandrel constructions meeting approximately STC-45 sound isolation performance
- Acoustical character of rooms: High absorption finishes/furniture for bedrooms and intermediate absorption finishes/furniture for living rooms.

Based on the predicted plane of window sound levels and the assumptions listed above, recommendations for the minimum sound insulation ratings for the building components were determined using the National Research Council of Canada "BPN-56 method" (NRCC, 1985). The reported results are in terms of Sound Transmission Class (STC) ratings, as summarized in **Table 6**.

Portion of Development	Facade	Window Glazing Requirements
Northeast Block – 6 Storey	North	STC-28
Podium	East	STC-25
	North	STC-28
Northwest Block – 6 Storey	West	STC-26
Podium	Northwest Corner Units <sup>[1]</sup>	STC-29
Northwest Block – 14 Storey Tower	North	STC-25

#### Table 6: Recommended Facade Component Minimum Sound Insulation Rating

Note(s):

1. Corner units with 2 façades exposed to noise from road traffic (to the north and west)

The maximum requirement for the window glazing was determined to be STC-29, which is considered feasible as this can be achieved by various double-glazed configurations of insulated glazing units. Façade spandrel and doors meeting the minimum Ontario Building Code are predicted to be sufficient for all facades of the proposed development.

We recommend that the façade construction is reviewed during detailed design to ensure that the indoor sound level limits will be met and that the window/door supplier is requested to provide STC laboratory test reports as part of shop drawing submittal to confirm that the glazing components will meet the minimum STC requirements.

#### 4.3.1.2 Ventilation Recommendations

Due to the transportation sound levels at the plane of the façade, central air conditioning is recommended for the proposed development to allow for windows and doors to remain closed as a noise mitigation measure. Further, prospective purchasers or tenants should be informed by appropriate warning clause provided in Section 4.3.3.

#### 4.3.1.3 Outdoor Living Areas

Due to exposure to transportation sources, the predicted sound levels in the OLA is predicted to be elevated at OLA\_02, OLA\_03, OLA\_04, and OLA\_08. To reduce the transportation sound levels in OLAs to meet the applicable criteria of 55 dBA, noise barriers are recommended, if feasible.

The recommended geometry of the noise barriers is included in **Figure 3** (to meet 55 dBA). The barriers for the atgrade OLAs are presented with a height of 1.8m as per the Guelph Noise Control Guidelines. A barrier height of 1.1m is recommended for the level 7 west amenity space of Block D. The barrier heights are summarized in **Table 7**. General guidance with respect to noise barrier design is included in **Appendix D**. If mitigation is not provided for the OLAs, sound levels are predicted to meet 60 dBA criteria; however, appropriate warning clause should be included. Warning clause language is provided in Section 4.3.3.

Receptor	Description	Predicted OLA Sound Level Daytime L <sub>EQ</sub> , 16hr	Barrier Height (m) to Meet Sound Level Criterion ≤ 55 dBA <sup>1</sup>
OLA_02b	Southwest Block At-grade Outdoor Amenity (South Amenity)	58	1.8 m
OLA_02c	Southwest Block At-grade Outdoor Amenity (South Amenity)	60	1.8 m
OLA_03a	Southwest Block At-grade Outdoor Amenity (West Amenity)	59	1.8 m
OLA_03b	Southwest Block At-grade Outdoor Amenity (West Amenity)	55	-
OLA_03c	Southwest Block At-grade Outdoor Amenity (West Amenity)	58	1.8 m
OLA_04a	Northwest and Northeast Blocks At-grade Outdoor Amenity	60	1.8 m
OLA_04b	Northwest and Northeast Blocks At-grade Outdoor Amenity	60	1.8 m
OLA_08	Northwest Block Level 7 Outdoor Amenity (West Amenity)	57	1.1 m

#### **Table 7: Barrier Height Recommendations for OLAs**

Note(s):

1. Refer to Figure 3 for barrier geometry to meet 55 dBA. If noise control measures are not provided, a warning clause is required.

## 4.3.2 Stationary Sources

Based on the noise modeling results and setback distances, the proposed development is not anticipated to infringe on the compliance of any facility with environmental noise permits (ECA or EASR). However, excesses of the guideline limits are predicted. Excesses of the guideline limits are predicted to range up to 5 dBA during daytime/evening and up to 11 dBA during nighttime.

First Capital owns the Pergola Commons plaza to the west of the proposed development. Thus, administrative arrangements for on-source mitigation will not involve any third party. With the implementation of mitigation for sources associated with the Keg and the shopping center building containing Goodlife Fitness, the proposed development is feasible to meet the guideline limits. Assumptions applied to the noise model regarding duty cycles and sound power levels of surrounding equipment should be verified and refined during the Detailed Design phase before mitigation measures are implemented. Moreover, sound measurement during peak summertime is recommended.

Overall reductions to meet compliance with the guideline limits are presented below, with corresponding source locations presented in **Figure 5**.

			Sound	Required	Duty Cycle		
Facility	Source Labels for Figure 5	Proxy Data / Manufacturer Data / Measurement	Power Level (dBA)	Overall Reduction (dB)	Daytime and Evening (07:00h – 23:00h)	Nighttime (23:00h – 07:00h) <sup>[5]</sup>

The reductions shown in **Table 8** are considered feasible through a combination of replacement with low-noise units, oversizing the unit and operating at lower capacity, silencers, and/or inclusion of a cantilevered barrier. The noise model should be verified and refined to reduce the number of assumptions made and to ensure it accurately represents reality.

Moreover, a perimeter barrier of height of 1.3 m is required for OPOR\_08 and a 1.1 m height barrier is required to the north of the podium, as shown in **Figure 6**, to meet the applicable sound level limits.

Due to the proximity of the proposed development to the commercial facilities, a warning clause is recommended to inform prospective occupants of the potential for audible noise from these facilities. Warning clause language is provided in Section 4.3.3.

## 4.3.3 Warning Clauses

The following warning clauses from the Guelph Noise Control Guidelines are recommended for the proposed development:

1. Outdoor Living Areas Subject to High Transportation Impacts if no barriers are included:

"The Transferee of [insert lots/blocks/units], for themselves, their heirs, executors, administrators, successors, and assigns acknowledge being advised that sound levels due to increasing road traffic may occasionally interfere with some outdoor activities of the dwelling occupants as the sound levels may at times exceed the sound level limits of the municipal and provincial noise criteria."

2. Central Air Conditioning Provided for the development:

"This dwelling unit has been supplied with a central air conditioning system which will allow windows and exterior doors to remain closed, thereby ensuring that the indoor sound levels are within the municipal and provincial sound level limits."

3. Upgraded Glazing for podiums of Blocks C and D:

"The building components of this dwelling unit (walls, windows and exterior doors) have been designed to provide acoustic insulation so that, when windows and exterior doors are closed, the indoor sound levels are within the municipal and provincial sound level limits. The details of this building component design are available by contacting the builder of this unit."

4. Close Proximity to Stationary Sources of Noise:

"Purchasers/tenants are advised that due to the proximity of the adjacent commercial plaza, noise from the commercial plaza may at times be audible and interfere with outdoor activities."

In addition, this clause shall be included in all cases:

"The Transferee covenants with the Transferor that the below clause, verbatim, will be included in all subsequent Agreements of Purchase of sale or lease and Sale and Deeds conveying the lands described herein, which covenant shall run with the said lands and is for the benefit of the subsequent owners and renters of the said lands and the owner of the adjacent road."

RWDI#2401100 December 12, 2023

# 5 THE EFFECTS OF THE PROPOSED DEVELOPMENT ON ITS SURROUNDINGS AND ON ITSELF

On-site stationary sources for the development are expected to consist of HVAC-related equipment in the rooftop mechanical penthouse as well as various exhaust fans. Further, consideration should be given to control airborne and structure-borne noise generated within the proposed development.

Within the development itself, the main sources of noise that are likely to affect the use of the building are the mechanical systems. The potential noise effect of the commercial component of the development is recommended to be reviewed during detailed design to ensure the applicable criteria will be met.

Provided that best practices for the acoustical design of the building are followed, noise from building services equipment associated with the development is expected to be feasible to meet the applicable sound level criteria due to the nature (residential/mixed-use) of the proposed development.

We recommend that the potential noise effect of the proposed development is reviewed during detailed design to ensure the applicable sound level criteria will be achieved.

# 6 CONCLUSIONS

RWDI was retained to prepare a Noise and Vibration Impact Study for the proposed mixed-use development located in Guelph, Ontario.

The following noise control measures are recommended for the proposed development:

- 1. Installation of central air-conditioning so that all suites' windows can remain closed.
- 2. The inclusion of noise warning clauses related to:
  - a. Transportation sound levels at the building façade and in the outdoor amenity areas
  - b. Proximity to commercial/industrial land use
- 3. Minimum sound isolation performance:
  - a. Suite window glazing with minimum sound isolation performance up to STC-29 for certain façade of the podiums of Blocks C and D and Tower D, as detailed herein.
- 4. Construction of perimeter noise barriers along some outdoor amenity areas, if feasible, to address transportation noise. Otherwise, the applicable warning clause should be included.
- 5. Construction of perimeter noise barriers for the west outdoor amenity area on the podium of Tower D and to its north to address surrounding stationary sources of noise.
- 6. Apply offsite on-source mitigation for the HVAC equipment associated with the commercial plaza to the immediate west, as detailed herein.

RWDI#2401100 December 12, 2023

The potential noise levels from stationary sources of sound were investigated. Based on the noise modeling results and setback distances, the land use compatibility of the proposed development with respect to the nearby industrial land uses is considered acceptable from the noise assessment perspective with implementation of mitigation measures for adjacent stationary sources. Due to the proximity of the proposed development to commercial facilities, a warning clause is recommended to inform prospective occupants of the potential for audible noise from these facilities. Moreover, offsite on-source mitigation is required for the HVAC equipment associated with the commercial plaza to the immediate west, as discussed in the study.

At this stage in design, the noise levels produced by the development on itself and its surroundings could not be quantitatively assessed. However, the effect on both the building itself and its surroundings is expected to be feasible to meet the applicable criteria. We recommend that the building design is evaluated prior to building permit to ensure that the acoustical design is adequately implemented in order to meet the applicable criteria.

Based on the results of the analysis, including implementation of the recommendations included with this assessment, the proposed development is feasible to meet the applicable sound and vibration criteria.

## STATEMENT OF LIMITATIONS

This report entitled "Noise and Vibration Impact Study – 1 Clair Road East", dated December 12, 2023, was prepared by RWDI AIR Inc. ("RWDI") for First Capital ("Client"). The findings and conclusions presented in this report have been prepared for the Client and are specific to the project described herein ("Project"). The conclusions and recommendations contained in this report are based on the information available to RWDI when this report was prepared. Because the contents of this report may not reflect the final design of the Project or subsequent changes made after the date of this report, RWDI recommendations provided in this report have been correctly interpreted in the final design of the Project.

The conclusions and recommendations contained in this report have also been made for the specific purpose(s) set out herein. Should the Client or any other third party utilize the report and/or implement the conclusions and recommendations contained therein for any other purpose or project without the involvement of RWDI, the Client or such third party assumes any and all risk of any and all consequences arising from such use and RWDI accepts no responsibility for any liability, loss, or damage of any kind suffered by Client or any other third party arising therefrom.

Finally, it is imperative that the Client and/or any party relying on the conclusions and recommendations in this report carefully review the stated assumptions contained herein and understand the different factors which may impact the conclusions and recommendations provided.

# APPENDIX B

### CRITERIA

The Guelph Noise Control Guidelines are to be read in conjunction with the MECP publication "Environmental Noise Guideline Stationary and Transportation Sources – Approval and Planning" Publication NPC-300, August 2013. Unless otherwise indicated in the Guelph Noise Control Guidelines, the principles and policies of NPC-300 must be followed for all noise studies submitted.

### **Transportation Sources**

Guidance from the Ontario Ministry of the Environment, Conservation and Parks (MECP) NPC-300 Environmental Noise Guideline was used to assess environmental noise generated by transportation-related sources. There are three aspects to consider, which include the following:

- i. Transportation source sound levels in indoor living areas (living rooms and sleeping quarters), which determines building façade elements (windows, exterior walls, doors) sound insulation design recommendations.
- ii. Transportation source sound levels at the plane of the window, which determines air-conditioning and ventilation system recommendations and associated warning clauses which inform the future occupants that windows and doors must be closed in order to meet the indoor sound level criteria.
- iii. Transportation source sound levels in Outdoor Living Areas (OLAs), which determines OLA noise mitigation and related warning clause recommendations.

### **Road and Rail**

### Indoor Sound Level Criteria

For assessing sound originating from transportation sources, NPC-300 defines sound level criteria as summarized in **Table 1** for indoor areas of sensitive uses. The specified values are maximum sound levels and apply to the indicated indoor spaces with the windows and doors closed.

		Sound Level Criteria (Indoors)				
Type of Space	Source	Daytime L <sub>eq,16-hr</sub> 07:00h – 23:00h	Nighttime L <sub>eq,8-hr</sub> 23:00h – 07:00h			
<b>Living Quarters</b> Examples: Living, dining and den areas of residences,	Road	ad 45 dBA				
hospitals, nursing homes, schools and daycare centres	Rail	Rail 40 dBA				
Sleeping Quarters	Road	45 dBA	40 dBA			
	Rail	40 dBA	35 dBA			

### Table 1: Indoor Sound Level Criteria for Road and Rail Sources

NPC-300 also provides guidelines for acceptable indoor sound levels that are extended to land uses and developments which are not normally considered noise sensitive. The guideline sound level criteria presented in **Table 2** are provided to inform good-practice design objectives.

		Sound Level Criteria (Indoors)				
Type of Space	Source	Daytime L <sub>eq,16-hr</sub> 07:00h – 23:00h	Nighttime L <sub>eq,8-hr</sub> 23:00h - 07:00h			
General offices, reception areas, retail stores, etc.	Road	50 dBA	-			
	Rail	45 dBA	-			
Theatres, places of worship, libraries, individual or semi-	Road	45 dBA	-			
private offices, conference rooms, reading rooms, etc.	Rail	40 dBA	-			
Sleeping quarters of residences, hospitals,	Road	-	40 dBA			
nursing/retirement homes, etc.	Rail	-	35 dBA			
Sleeping quarters of hotels/motels	Road	-	45 dBA			
	Rail	-	40 dBA			

### Table 2: Supplementary Indoor Sound Level Criteria for Road and Rail Sources

### **Outdoor Living Areas (OLAs)**

Outdoor Living Areas (OLAs) would include outdoor areas intended and designed for the quiet enjoyment of the outdoor environment and which are readily accessible from the building.

OLAs may include any common outdoor amenity spaces associated with a multi-unit residential development (e.g. courtyards, roof-top terraces), and/or private backyards and terraces with a minimum depth of 4m provided they are the only outdoor living area for the occupant. The sound level criteria for outdoor living areas is summarized in **Table 3**.

### Table 3: Sound Level Criteria – Outdoor Living Area

	Sound Level Criteria (Outdoors)					
Assessment Location	Daytime L <sub>eq,16-hr</sub> 07:00h – 23:00h	Nighttime L <sub>eq,8-hr</sub> 23:00h – 07:00h				
Outdoor Living Area (OLA) (Combined Road and Rail)	55 dBA	-				

### **Outdoor and Plane of Window Sound Levels**

In addition to the sound level criteria, noise control measures and requirements for ventilation and warning clauses requirements are recommended for residential land-uses based on predicted transportation source sound levels incident in the plane of window at bedrooms and living/dining rooms, and/or at outdoor living areas. These recommendations are summarized in **Table 4** below.

<b>A</b>	Transportation Sou	nd Level (Outdoors)	
Assessment Location	Daytime L <sub>eq.16-hr</sub> 07:00h – 23:00h	Nighttime L <sub>eq.8-hr</sub> 23:00h - 07:00h	Recommendations
			Installation of air conditioning to allow windows to remained closed.
2	> 65 dBA	> 60 dBA	The sound insulation performance of building components must be specified and designed to meet the indoor sound level criteria.
indo			Warning clause "Type D" is recommended.
Plane of Window (Road)	> 55 dBA	> 50 dBA	Applicable for low and medium density development: Forced-air ventilation system to allow for the future installation of air- conditioning. Warning clause "Type C" is recommended.
			Applicable for high density development: Air conditioning to allow windows to remained closed. Warning clause "Type D" is recommended.
Plane of Window (Rail <sup>1, 2</sup> )	> 60 dBA	> 55 dBA	The acoustical performance of building façade components should be specified such that the indoor sound level limits are predicted to be achieved.
e of Wind (Rail <sup>1, 2</sup> )			Warning clause "Type D" is recommended.
Plane (		L <sub>eq, 24h</sub> r) and	Exterior walls consisting of a brick veneer or masonry equivalent for the first row of dwellings.
	< 100m fr	om tracks	Warning clause "Type D" is recommended.
Outdoor Living Area Combined Road and	≤ 60 dBA > 55 dBA	-	If sound levels are predicted to exceed 55 dBA, but are less than 60 dBA, noise controls may be applied to reduce the sound level to 55 dBA.
Co Co Ro	~ 55 UDA		If noise control measures are not provided, a warning clause "Type A" is recommended.

### Table 4: Ventilation, Building Component, and Warning Clauses Recommendations for Road/Rail Sources

# Š

<b>6</b>	Transportation Sou	ind Level (Outdoors)				
Assessment Location	Daytime L <sub>eq.16-hr</sub> 07:00h – 23:00h	Nighttime L <sub>eq,8-hr</sub> 23:00h – 07:00h	Recommendations			
			Noise controls (barriers) should be implemented to meet the 55 dBA criterion.			
	> 60 dBA	-	If mitigation is not feasible to meet the 55 dBA criterion for technical, economic or administrative reasons, an exceedance of 5 dB may be acceptable (to a maximum sound level of 60 dBA). In this case a warning clause "Type B" would be recommended.			

vote(s)

1. Whistle noise is included (if applicable) in the determination of the sound level at the plane of window.

2. Some railway companies (e.g. CN, CP) may require that the exterior walls include a brick veneer or masonry equivalent for the façade facing the railway line, regardless of the sound level.

3. Whistle noise is not included in the determination of the sound level at the OLA.

### **Stationary Sources**

### NPC-300 Sound Level Criteria – Stationary Sources

Guidance from the MECP NPC-300 Environmental Noise Guideline is used to assess environmental noise generated by stationary sources, for example industrial and commercial facilities.

Noise from stationary sources is treated differently from transportation sources and requires sound levels be assessed for the predictable worst-case one-hour average sound level (Leq) for each period of the day. For assessing sound originating from stationary sources, NPC-300 defines sound level criteria for two types of Points of Reception (PORs): outdoor and plane of window.

### **Continuous Sources – Regular Operations**

The assessment criteria for all PORs is the higher of either the exclusion limit per NPC-300 or the minimum background sound level that occurs or is likely to occur at a POR. The applicable exclusion limit is determined based on the level of urbanization or "Class" of the area. The NPC-300 exclusion limits for continuously operating stationary sources are summarized in **Table 5**.

Time Period	Class	1 Area	Class	2 Area	Class	3 Area	Class 4 Area		
	Outdoor	Plane of Window	Outdoor	Plane of Window	Outdoor	Plane of Window	Outdoor	Plane of Window	
Daytime 0700-1900h	50 dBA	50 dBA	50 dBA	50 dBA	45 dBA	45 dBA	55 dBA	60 dBA	
Evening 1900-2300h	50 dBA	50 dBA	45 dBA	50 dBA	40 dBA	40 dBA	55 dBA	60 dBA	

Table 5: NPC-3	300 Exclusion Limits -	Continuous and	Quasi-Steady	Impulsive Statior	ary Sources (LAeq-1hr)

Time	Class	1 Area	Class	2 Area	Class	3 Area	Class 4 Area		
Period	Outdoor	Plane of Window	Outdoor	Plane of Window	Outdoor	Plane of Window	Outdoor	Plane of Window	
Nighttime 2300-0700h		45 dBA		45 dBA		40 dBA		55 dBA	

Note(s):

1. The applicable sound level criterion is the background sound level or the exclusion limit, whichever is higher.

2. Class 1, 2 and 3 sound level criteria apply to a window that is assumed to be open.

Class 4 area criteria apply to a window that is assumed closed. Class 4 area requires formal designation by the land-use planning authority. 3.

### **Continuous Sources - Emergency Equipment Testing**

Sound level criteria for emergency backup equipment (e.g. generators) operating in non-emergency situations such as testing or maintenance are 5 dB greater than the applicable sound level criteria for stationary sources.

In addition, the operation of emergency equipment under maintenance and testing conditions is assessed separately from all other stationary noise sources.

### **D-Series Guidelines**

The MECP D-series guidelines (MOE, 1995) provide direction for land use planning to maximize compatibility of industrial uses with adjacent land uses. The goal of Guideline D-6 is to minimize encroachment of sensitive land uses on industrial facilities and vice versa, in order to address potential incompatibility due to adverse effects such as noise, odour and dust.

For each class of industry, the guideline provides an estimate of potential influence area and states that this influence area shall be used in the absence of the recommended technical studies. Guideline D-6 also recommends a minimum separation distance between each class of industry and sensitive land uses (see **Table 6**). Section 4.10 of D-6 identifies exceptional circumstances with respect to redevelopment, infill and mixed-use areas. In these cases, the guideline suggests that separation distances at, or less than, the recommended minimum separation distance may be acceptable if a justifying impact assessment is provided.

Industry Class	Definition	Potential Influence Area <sup>[1]</sup>	Recommended Minimum Separation Distance <sup>[1]</sup>
Class I	Small scale, self-contained, daytime only, infrequent heavy vehicle movements, no outside storage.	70 m	20 m
Class II	Medium scale, outdoor storage of wastes or materials, shift operations and frequent heavy equipment movement during the daytime.	300 m	70 m
Class III	Large scale, outdoor storage of raw and finished products, large production volume, continuous movement of products and employees during daily shift operations.	1000 m	300 m
Note(s):			

### Table 6: Summary of Guideline D-6

. 1. Measured from Property Line to Property Line.

Guideline D-6 provides criteria for classifying industrial land uses, based on their outputs, scale of operations, processes, schedule and intensity of operations. **Table 7** provides the classification criteria and examples.

# <u> K</u>N

Criteria	Class I	Class II	Class III
Outputs	<ul> <li>Sound not audible off property</li> <li>Infrequent dust and/ or odour emissions and not intense</li> <li>No ground-borne vibration</li> </ul>	<ul> <li>Sound occasionally audible off property</li> <li>Frequent dust and/ or odour emissions and occasionally intense</li> <li>Possible ground-borne vibration</li> </ul>	<ul> <li>Sound frequently audible off property</li> <li>Persistent and intense dust and/ or odour emissions</li> <li>Frequent ground-borne vibration</li> </ul>
Scale	<ul> <li>No outside storage</li> <li>Small scale plant or scale is irrelevant in relation to all other criteria</li> </ul>	<ul> <li>Outside storage permitted</li> <li>Medium level of production</li> </ul>	<ul> <li>Outside storage of raw and finished products</li> <li>Large production levels</li> </ul>
Process	<ul> <li>Self-contained plant or building which produces / stores a packaged product</li> <li>Low probability of fugitive emissions</li> </ul>	<ul> <li>Open process</li> <li>Periodic outputs of minor annoyance</li> <li>Low probability of fugitive emissions</li> </ul>	<ul> <li>Open process</li> <li>Frequent outputs of major annoyances</li> <li>High probability of fugitive emissions</li> </ul>
Operation / Intensity	<ul> <li>Daytime operations only</li> <li>Infrequent movement of products and/or heavy trucks</li> </ul>	<ul> <li>Shift operations permitted</li> <li>Frequent movements of products and/or heavy trucks with majority of movements during daytime hours</li> </ul>	<ul> <li>Continuous movement of products and employees</li> <li>Daily shift operations permitted</li> </ul>
Examples	<ul> <li>Electronics Manufacturing</li> <li>Furniture refinishing</li> <li>Beverage bottling</li> <li>Auto parts</li> <li>Packaging services</li> <li>Dairy distribution</li> <li>Laundry and linen supply</li> </ul>	<ul> <li>Magazine printing</li> <li>Paint spray booths</li> <li>Metal command</li> <li>Electrical production</li> <li>Dairy product manufacturing</li> <li>Feed packing plant</li> </ul>	<ul> <li>Paint and varnish manufacturing</li> <li>Organic chemicals manufacturing</li> <li>Breweries</li> <li>Solvent recovery plant</li> <li>Soap manufacturing</li> <li>Metal manufacturing</li> </ul>

## APPENDIX D

### NOISE MITIGATION GUIDANCE

#### Acoustic/Noise Barrier

#### **Transportation Noise**

Generally, noise controls to attenuate transportation sound levels at Outdoor Living Areas (OLAs) would consist of the implementation of acoustic/noise barriers with materials that would meet the guidance included in NPC-300, for example:

- A wall, berm, wall/berm combination or similar structure, used as a noise control measure, and high enough to break the line-of-sight between the source and the receptor.
- The minimum surface density (face weight) is 20 kg/m<sup>2</sup>
  - Many materials could satisfy the surface density requirement, e.g. wood, glass, concrete, Plexiglas, Acrylite.
  - The required thickness can be determined by dividing the 20 kg/m<sup>2</sup> face weight by the material density (kg/m<sup>3</sup>). Typically, this would imply:
    - 50 mm (2") thickness of wood
    - 13 mm (0.5") thickness of lighter plastic (like Plexiglas or PVC)
    - 10 mm (0.4") thickness of heavier material (like aluminum, glass, concrete)
- The barrier should be structurally sound, appropriately designed to withstand wind and snow load, and constructed without cracks or surface gaps. Joints between panels may need to be overlapped to ensure surfaces are free of gaps, particularly for wood construction.
- Any gaps under the barrier that are necessary for drainage purposes should be minimized and localized, so that the acoustical performance of the barrier is maintained.
- If a sound absorptive face is to be included in the barrier design, the minimum noise reduction coefficient is recommended to be NRC 0.7.

The Guelph Noise Control Guidelines specify the following requirements for noise barriers in addition to the above requirements:

- Noise barrier wall/fence heights for new development shall be 1.8m
- Have no holes or gaps
- Be non-combustible
- Be resistant to graffiti or include a graffiti resistive coating conforming to relevant ASTM standards (fences)
- Be vermin and fungus resistant (fences)
- Have a minimum predicted maintenance free lifespan of 20 years
- Final barrier material/manufacturer shall be approved by the City
- As an alternative to the mass density requirement of 20 kg/m<sup>2</sup>:
  - the Sound Transmission Class (STC) of the panel material must be 20 or greater when tested in accordance with ASTM-E90 (with a test report to be submitted for approval), or

#### rwdi.com

• The Sound Transmission Class (STC) of the panel material has historically been demonstrated to be 30 or greater (include references)

#### **Mechanical Equipment**

Noise controls to attenuate mechanical equipment sound levels at Outdoor Points of Reception (OPOR) would consistent with the of the implementation of acoustic/noise barriers for Transportation sources, with the exception of the following:

• The minimum surface density (face weight) is **10** kg/m<sup>2</sup>.

All other barrier quality and characteristics would be consistent with the details provided above.

#### **Building Ventilation and Air Conditioning**

The use of air conditioning itself is not a noise control measure; however, it allows for windows and doors to remain closed, thereby reducing the indoor sound levels.

NPC-300 provides the following guidance with respect to implementation of building ventilation and air conditioning:

- a. the noise produced by the proposed ventilation system in the space served does not exceed 40 dBA. In practice, this condition usually implies that window air conditioning units are not acceptable;
- b. the ventilation system complies with all national, provincial and municipal standards and codes;
- c. the ventilation system is designed by a heating and ventilation professional; and
- d. the ventilation system enables the windows and exterior doors to remain closed.

Air conditioning systems also need to comply with Publication NPC-216, and/or any local municipal noise by-law that has provisions relating to air conditioning equipment.

# APPENDIX E

Parameter	Unit	Definition
Nr		Ray Number
Х	(m)	X-axis Cartesian Coordinate
Y	(m)	Y-axis Cartesian Coordinate
Z	(m)	Z-axis Cartesian Coordinate
