Distance to Surface Water Body	36.5 m	500 m	Distance to the Eramosa River
Minimum Depth to Groundwater	3 m	0.93	Site-specific value based on groundwater measurements
Horizontal Hydraulic Gradient	0.003 m/m	0.002 m/m	Site-specific value based on groundwater measurements
Hydraulic Conductivity	3.0×10^{-5} m/s	3.9×10^{-5}	Site-specific values from slug tests conducted in monitoring wells screened in the upper hydrostratigraphic unit (overburden and bedrock contact zone)

Jacobs also notes that the source size of 340 cubic metres for some contaminant groups may be larger than that assumed by the MECP in the derivation of the generic standards; this difference may affect specific component values where source depletion or groundwater transport was assumed. However, the nature of the RA is generally conservative, which may minimize the specific impact that the aforementioned differences may have on the assessment. The use of the MECP SCS and associated component values were considered appropriate for use in the RA for the selection of contaminants of concern and for secondary screening purposes.

Additional Data Screening

As part of the Phase Two ESA, a thorough review of the soil and groundwater results was conducted as part of the screening and identification of COCs. Select soil and groundwater results, such as elevated laboratory reporting limits and parameters with no available criteria, were further evaluated and considered for their ability to accurately represent contaminants of potential concern (COPCs) and the Site conditions. At the discretion of the QP_{ESA} for the Site, some data were excluded from being carried through to the analytical database for the RA. The rationale for the removal the data points is presented in Table 6-7b (soil) and Table 6-10b (groundwater).

Phase Two Environmental Site Assessment Results and Conclusions

Soil environmental conditions were characterized based on evaluation of historical samples, in addition to the recent investigations conducted for the Phase Two ESA.

Soil conditions were characterized using the Phase Two ESA sampling and reliable historical data, comprising 353 soil samples from 183 locations across the Phase Two Property. Figure 4-1 (Appendix D3) shows the sample locations.

Soils on the Phase Two Property were found to be generally impacted with elevated concentrations of metals and PHCs. Localized soil impacts from polycyclic aromatic hydrocarbons (PAHs), BTEX, VOCs, other regulated parameters (ORPs), and polychlorinated biphenyls (PCBs) were also identified in limited areas at the Phase Two Property. The presence of these parameters is consistent with the historical and industrial land use of the Site.

Groundwater across the Phase Two Property was evaluated using data (448 samples) from 100 permanent monitoring wells screened in the overburden and bedrock contact zone, the competent Eramosa Formation bedrock unit, or the Goat Island Formation bedrock unit. Groundwater within the overburden and contact zone aquifer unit was identified to be generally impacted with VOCs, with localized impacts of metals (arsenic, lead, and zinc), BTEX, PAHs, and PHCs. Groundwater within the competent Eramosa Formation bedrock unit was identified to be generally impacted with VOCs, with localized impacts of metals (arsenic, lead, and zinc), benzene, and PHCs (F2 and F3). One well is installed in the deep Goat Island Formation aquifer unit and was found to be impacted with cis-1,2-dichloroethene.

Soil Exceedances of the Table 6 Site Condition Standards

The following soil quality summary is provided for the soil samples that exceeded the Table 6 SCS:

- Concentrations of metals in soil greater than the Table 6 SCS soil were identified in 151 samples (of 235) from 100 locations to a depth of 2.9 mbgs. Soil exceedances for metals were widespread across the Phase Two Property and are interpreted to occur throughout most of the fill, extending to the bedrock surface.
- ORPs (that is, sodium absorption ratio [SAR], electrical conductivity [EC], and cyanide) were analyzed in 105 samples from 75 locations. Three samples from two locations exceeded Table 6 SCS for EC in the former excavation area in the northeastern corner of the Phase Two Property.
- Concentrations of PAHs in soil greater than the Table 6 SCS were identified in 30 samples (of 125) from 22 locations, and were found along the western border, in the south-central area, and the eastern third of the Site. PAH exceedances were identified to a depth of 2.13 mbgs.
- Concentration of PHCs in soil greater than the Table 6 SCS were identified in a total of 27 samples (of 130) from 21 locations. Exceedances were found to be localized to three areas: along the western border, in the south-central area, and the northeastern and eastern portion of the Site. PHC exceedances were identified to a depth of 3.2 mbgs.
- Concentrations of BTEX in soil greater than the Table 6 SCS were identified in a total of 3 soil samples (of 146) from 2 locations in the central and western areas of the Site. BTEX exceedances were identified to a depth of 1.22 mbgs.
- Concentrations of PCBs in soil greater than the Table 6 SCS were identified in 6 samples (of 72) from 5 locations in three different areas to a depth of 1.3 mbgs.
- Concentrations of VOCs (specifically, trichloroethylene [TCE]) in soil greater than the Table 6 SCS were identified in a total of 12 samples (of 126) from 7 locations within 2 areas along the southern and eastern borders of the Site. VOC exceedances were identified to a depth of 3.05 mbgs.
- Acid, base, and neutrals (ABNs) and chlorophenols (CPs) were not detected at concentrations greater than the Table 6 SCS; however, reporting limits (RLs) were raised for some parameters, resulting in RL exceedances of the Table 6 SCS.

The CSM provides additional details (Appendix D3) regarding soil quality and delineation.

Groundwater Exceedances of the Table 6 Site Condition Standards

The following groundwater quality summary is provided for the groundwater samples exceeding the Table 6 SCS:

- Concentrations of VOCs in groundwater were greater than the Table 6 SCS in 187 samples (of 344) in 53 locations. Exceedances of chloroethenes (specifically, 1,1-dichloroethene [1-1-DCE]; cis-1,2-dichloroethene; tetrachloroethene; trans-1,2-dichloroethene; trichloroethylene; and vinyl chloride) were found to be widespread throughout the Site (mainly to the south and east) at all depth intervals. A total of 183 samples (of 344) from 51 locations had exceedances of the Table 6 SCS for chloroethenes. Exceedances of chloroethanes (specifically, 1,1,1-trichloroethane and 1,1-dichloroethane) were found to be localized to the southwestern area of the Phase Two Property, primarily in the overburden and bedrock contact zone. One well screened within the competent Eramosa Formation aquifer (MW18-122D) had an exceedance of 1,1-dichloroethane.
- Concentrations of metals (primarily arsenic, lead, and zinc) in groundwater were greater than the Table 6 SCS in 71 samples (of 252) from 22 locations. Arsenic exceedances were localized to one location at the north-central area of the Site in the upper overburden and bedrock contact zone. Lead exceedances were localized to OW09-II (screened in the Eramosa) and OW07-33; however, OW07-33 has had subsequent sampling results less than the Table 6 SCS. Many of the zinc exceedances were located on the eastern third of the Phase Two Property, and generally limited to the upper overburden and bedrock contact zone.
- Concentrations of BTEX in groundwater were greater than the Table 6 SCS in 70 samples (of 378) from 17 locations. Of these samples, concentrations of benzene were elevated in 68 samples from 17 locations, and exceedances of ethylbenzene were identified in 4 samples from 3 locations. Exceedances were localized to the eastern third of the Site and the south-central area along the southern boundary.
- Concentrations of PAHs in groundwater were greater than the Table 6 SCS in 24 samples (of 197) from 8 locations. Exceedances were localized to the eastern third, the north-central, and south-central portions of the Phase Two Property. All exceedances were found in wells screened in the overburden and contact zone aquifer; no PAHs impacts were reported in wells screened in the Eramosa Formation bedrock unit or the Goat Island bedrock unit.
- Concentrations of PHCs in groundwater were greater than the Table 6 SCS in 26 samples (of 211) from 8 locations. LNAPL was observed at OW23S, MW17-108S, and MW18-135S. Exceedances were localized to the eastern-third and the south-central areas of the Phase Two Property, which are limited to the overburden and contact zone aquifer. Two locations screened in the Eramosa Formation bedrock unit (OW18-II and OW23D) have generally have PHC concentrations less than the Table 6 SCS, with isolated exceedances occurring in 2015 and 2016. PHC concentrations have meet the Table 6 SCS in the most recent sampling events at these locations.
- Of the 27 samples analyzed in groundwater for PCBs, one location, OW26S, had an exceedance of the Table 6 SCS in 2010. Subsequent samples collected in 2011 and 2017 met the Table 6 SCS for PCBs; therefore, PCBs are not considered a groundwater COC for the Site.
- ORPs (that is, sodium, chloride, and cyanide), ABNs, and CPs were not detected at concentrations greater than the Table 6 SCS; however, RLs were raised for 1,1'-biphenyl at OW23S, resulting in an RL exceedance of the Table 6 SCS.

Refer to the CSM for additional details (Appendix D3) regarding groundwater quality and delineation.

Tables

Table 2-3. Items Considered for Site Condition Standards Selection

Phase Two Environmental Site Assessment, 200 Beverly Street, Guelph, ON

Condition	Evaluation
Land use	The current land use is industrial, and the proposed future land use may include residential/parkland and commercial uses, provided an RSC acknowledged by the MECP is obtained.
Potable or nonpotable groundwater	The Site and adjacent properties within 100 m are serviced by a municipal water source. Because the groundwater near the Property does and will serve as a raw water supply for a drinking water system, the potable groundwater condition applies.
Proximity to surface water body	The Site is not located within 30 m of a water body.
Proximity to areas of natural significance or environmentally sensitive areas	The Site is not considered to be within proximity of an environmentally sensitive area based on the information reviewed as part of the Phase One ESA (CH2M HILL 2017).
Depth to bedrock	A property is considered a shallow soil property if one-third or more of the area consists of soil depths of 2 mbgs or less, excluding nonsoil surface treatment (that is, asphalt, concrete, or aggregate) (MOE 2011a).The depth to bedrock is considered to be less than 2 m, because shallow soil was observed on one-third or more of the Phase Two Property.
pH of soil	Based on the results of the Jacobs investigations, soil pH was found to range from 6.6 to 9.0, with the exception of two samples. Samples collected at BH17-204 and MW17-100S were measured with a pH value outside of MECP's acceptable upper limit of 9.0 for surface soils. A review of the borehole logs from these locations indicated that concrete rubble or dust was likely present in the submitted samples, which had pH values of 9.45 and 10.64. The other pH values collected during the CH2M investigation were within the MECP's acceptable range. The soil from BH17-204 was determined to be "isolated fill," because concrete foundations were encountered both above and below the soil layer, isolating it from the overburden soils at the Site. An additional sample was collected at MW17-100S, which reported a pH value of 7.71. Using the average of the two samples as outlined in Section 48 of O. Reg. 153/04, it was confirmed that pH concentrations were within the acceptable range.
Soil texture	For this evaluation, because of the extensive presence of heterogeneous fill materials across the Site, the standards for coarse-grained soils were used to be conservative.

Notes:

ESA = Environmental Site Assessment

m = metre(s)

mbgs = metre(s) below ground surface

MECP = Ministry of Environment, Conservation and Parks

O. Reg. = Ontario Regulation

RSC = record of site condition

Table 6-7b. Rationale for the Removal of Soil COCs
Phase Two Environmental Site Assessment, 200 Beverley Street, Guelph, Ontario

Parameter Group	Parameter(s)	Category	Detail/Sample(s)	Comment/Rationale
ABN	1,1'-Biphenyl 1,2,4-Trichlorobenzene 2,2'-oxybis(1-chloropropane) 2,4 & 2,6-Dinitrotoluene 3,3'-Dichlorobenzidine 4-Chloroaniline Bis (2-chloroethyl) ether Diethylphthalate	Parameters with existing SCS but RL exceedances only	Two surface samples (original and field duplicate) collected at TP17-300 in 2017 (Lab report L2003037)	The laboratory report indicates adjusted detection limits because of sample matrix effects (i.e., chemical interference, colour, and turbidity), preventing the determination of the presence or absence of the parameters (greater or less than regular detection limits), which may be due to the nature of the fill materials. Concentrations of these ABNs have not been detected elsewhere on the Site, including the remaining 21 samples from 12 locations where these parameters were analyzed as COPCs and RLs met the SCS. Additionally, a sample collected from a deeper interval at TP17-300 did not have raised RLs and met the SCS. Based on the available information, these parameters were determined to likely not be present at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, they were not considered to be COCs for the Site.
ABN	2,4 & 2,6-Dinitrotoluene 3,3'-Dichlorobenzidine Dimethylphthalate	Parameters with existing SCS but RL exceedances only	Six surface samples from 1991 (lab report 91-4281/P&R_E.O.90K2)	Parameters were run as part of older BNA laboratory scans alongside VOCs and PAHs and were not targeted COCs. Historical laboratory RLs may not have had capabilities to meet current SCS. Concentrations of these ABNs have not been detected elsewhere on the Site, including the 11 locations where ABNs were analyzed as a COPC, and RLs met the SCS. Based on the available information, these parameters were determined to likely not be present at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, they were not considered to be COCs for the Site.
ABN	2,4-Dinitrophenol	Parameters with existing SCS but RL exceedances only	Seven surface samples from three locations (MW17-105D, TP17-300 and TP17-301) in 2017, including 2 duplicates (lab report L2003037).	Lab indicated matrix effects as the reason for an RL increase, which may be due to the nature of the fill materials. No detected concentrations of 2,4-dinitrophenol have been reported at the Site, including 10 other locations where ABNs were analyzed as a COPC, and RLs met the SCS. Additionally, a sample collected from a deeper interval at MW17-105D did not have raised RLs and met the SCS. Based on the available information, this parameter was determined to likely not be present at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, it was not considered to be a COC for the Site.
CP	2,4-Dichlorophenol Pentachlorophenol	Parameters with existing SCS but RL exceedances only	Seven surface samples from three locations (MW17-105D, TP17-300 and TP17-301) in 2017, including 2 duplicates (lab report L2003037).	Lab indicated matrix effects as the reason for an RL increase, which may be due to the nature of the fill materials. No detected concentrations of 2,4-dichlorophenol and pentachlorophenol have been reported at the Site, including 10 other locations where ABNs were analyzed as a COPC, and RLs met the SCS. Additionally, a sample collected from a deeper interval at MW17-105D did not have raised RLs and met the SCS. Based on the available information, these parameters were determined to likely not be present at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, they were not considered to be COCs for the Site.
CHEMISTRY	Phosphorus	Parameters with no Table 6 SCS but exceeds the OTR value	Two samples from TP13-11 (TP11-6 and DUP2) in 2013 (Lab report B3K9090)	Two of 43 samples analyzed for phosphorus were above the OTR value of 1635 µg/g. The remaining 41 samples had concentrations of phosphorus below the OTR value. Samples were from 1991, 2007, and 2013, as phosphorus was analyzed as part of the historical laboratory metal suites; it was not targeted as a COC. As phosphorus is considered a nutrient and is not a COPC associated with APEC on Site, and at the discretion of the QPESA, phosphorus is not considered to be a COC for the Site.
~~METALS~~	~~Bismuth~~	~~Parameters with no Table 6 SCS and no OTR value~~	~~12 samples from 2013 (Lab report B3K9090)~~	~~Samples collected as part of historical test-pitting activities in 2013 included a full metals scan, including bismuth. The other metals without an SCS had an OTR value to compare concentrations except for bismuth. Concentrations ranged from nondetect values to 150 µg/g. Bismuth was not a targeted COC.~~ ~~Based on the available information, and at the discretion of the QPESA, bismuth is not considered to be a COC for the Site.~~
~~METALS~~	~~Calcium~~	~~Parameters with no Table 6 SCS but detected concentrations above the OTR value~~	~~20 samples from 18 locations collected between 2007 and 2013.~~	~~Twenty of a total of 43 samples from between 2007 and 2013 had results with detected concentrations greater than the OTR value of 53,508 µg/g. Calcium was analyzed as part of the historical laboratory metal suites and was not targeted as a COC.~~ ~~As the bedrock in the region is limestone and dolostone, which are typically abundant with calcium and magnesium, it is likely that soils in the region would also contain naturally elevated calcium concentrations. As calcium is considered a naturally occurring element and not a COPC associated with APECs on Site, and at the discretion of the QPESA, calcium is not considered to be a COC for the Site.~~
METALS	Chromium, Hexavalent (Cr6+)	Parameters with existing SCS but RL exceedances only	24 RL exceedances from 1991 (Lab reports P&R_E.O.90K26, 91-4543/P&R_E.O.90K2, 91-4281/P&R_E.O.90K2, 91-4543/91-4281)	The 24 samples collected in 1991 for hexavalent chromium had RL exceedances. Historical laboratory RLs may not have had capabilities to meet current SCS. Recent sampling conducted in 2007, 2017, and 2018 do not show concentrations detected on the Site above the SCS (65 results with nondetect concentrations below the SCS and 6 samples with detected concentrations below the SCS). Based on the available information, this parameter was determined to likely not be present at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, it was not considered to be a COC for the Site.

Table 6-7b. Rationale for the Removal of Soil COCs
Phase Two Environmental Site Assessment, 200 Beverley Street, Guelph, Ontario

Parameter Group	Parameter(s)	Category	Detail/Sample(s)	Comment/Rationale
METALS	Cyanide, Free	Parameters with existing SCS but RL exceedances only	All historical samples (five from 1991 and 20 from 2007) (Lab reports 91-281/P&R_E.O.90K2, P&R_E.O.90K26, 91-4281, 07T209831, 07T211735)	Samples analyzed for cyanide in 1991 and 2007 had RL exceedances. Historical laboratory RLs may not have had capabilities to meet current SCS. Recent sampling for cyanide (weak acid dissociable) conducted between 2017 and 2020 have 63 results with nondetect concentrations below the SCS. No concentrations of cyanide have been detected at the Site. Based on the available information, this parameter was determined to likely not be present at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, it was not considered to be a COC for the Site.
~~METALS~~	~~Iron~~	~~Parameters with no Table 6 SCS but detected concentrations above the OTR value~~	~~7 samples from 1991, 1 sample from 2007, and 1 sample from 2013~~	~~Nine of a total of 43 samples had detected concentrations exceeding the OTR value of 37808 µg/g. The remaining 36 samples had detected concentrations below the OTR value. Iron was analyzed as part of the historical laboratory metal suites and was not targeted as a COC.~~ ~~As iron is considered a naturally occurring element and is not a COPC associated with APECs on Site, and at the discretion of the QPESA, iron is not considered to be a COC for the Site.~~
~~METALS~~	~~Magnesium~~	~~Parameters with no Table 6 SCS but detected concentrations above the OTR value~~	~~9 samples from 1991, 4 samples from 2007, and 6 samples from 2013~~	~~Nineteen of a total of 43 samples had results with detected concentrations greater than the OTR value of 17,400 µg/g. The remaining 24 samples had detected concentrations below the OTR value. Magnesium was analyzed as part of the historical laboratory metal suite and was not targeted as a COC.~~ ~~As the bedrock in the region is limestone and dolostone, which are typically abundant with calcium and magnesium, it is likely that soils in the region would also contain naturally elevated magnesium concentrations. As magnesium is considered a naturally occurring element and not a COPC associated with APECs on Site, and at the discretion of the QPESA, magnesium is not considered to be a COC for the Site.~~
METALS	Selenium	Parameters with existing SCS but RL exceedances only	Two samples from BH18-207i collected in 2020 (lab report L2419793).	The laboratory report indicates that dilution was required because of high concentrations of test analytes. No detected concentrations of selenium exceeded the SCS in samples where metals were analyzed as a COPC, and RLs met the SCS in the other samples where selenium was not detected. Additionally, three samples collected at BH18-207 in 2018 located within 2 metres of BH18-207i, did not have raised RLs and met the SCS. Based on the available information, this parameter was determined to likely not be present at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, it was not considered to be COCs for the Site.
METALS	Sodium	Parameters with no Table 6 SCS but detected concentrations above the OTR value	6 samples from 1991, and 4 samples from 2013	Ten of a total of 43 samples had detected concentrations greater than the OTR value of 215 µg/g. Twenty-nine of the remaining 33 samples had detected concentrations of sodium below the OTR value, and 4 samples had nondetected concentrations of sodium. Sodium was analyzed as part of the historical laboratory metal suites, and current methods analyze Sodium risks, using SAR analysis. SAR results are below the SCS. Based on the available information, including SAR results below the SCS, at the discretion of the QPESA, sodium is not considered to be a COC for the Site.
METALS	Strontium	Parameters with no Table 6 SCS but detected concentrations above the OTR value	7 samples, 2 from 1991 and 5 from 2013	Seven of a total of 43 samples had detected concentrations greater than the OTR value of 87.5 µg/g, with a maximum of 190 µg/g. The remaining 36 samples had detected concentrations of strontium below the OTR value. Strontium was analyzed as part of the historical laboratory metal suites and was not targeted as a COC. As strontium is considered a naturally occurring element and is not a COPC associated with APEC on Site, and at the discretion of the QPESA, strontium is not considered to be a COC for the Site.
OCP	Hexachlorobutadiene Hexachloroethane	Parameters with existing SCS but RL exceedances only	6 historical samples from 1991 with RL exceedances in soil.	Samples analyzed for hexachlorobutadiene and hexachloroethane in 1991 had RL above the SCS. Historical laboratory RLs may not have had capabilities to meet current SCS. These individual OCP parameters (including hexachlorobenzene and hexachloropentadiene) were run as part of older BNA laboratory scans alongside VOCs and PAHs and were not targeted COCs. OCPs are not considered to be a COPC on Site, and therefore, they were not analyzed in the 2017/2018 environmental investigations. Based on the available information, at the discretion of the QPESA, these parameters are not considered to be COCs for the Site.
VOC	1,1,2,2-Tetrachloroethane	Parameters with existing SCS but RL exceedances only	One sample from MW17-108S in 2017 (2.74 to 2.9 mbgs) (Lab report L2007635)	One sample of the 126 samples analyzed contained an RL exceedance. Laboratory report indicated adjusted detection limits because of co-eluting interferences (i.e., interfering peaks on the VOC method) preventing the determination of the presence or absence of the VOC analytes (greater or less than regular detection limits). The remaining 125 samples, including one sample collected at a deeper interval at the same location, had nondetected concentrations of this parameter, which met the SCS. Based on the available information, this parameter was determined to likely not be present at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, it was not considered to be a COC for the Site.

Table 6-7b. Rationale for the Removal of Soil COCs
Phase Two Environmental Site Assessment, 200 Beverley Street, Guelph, Ontario

Parameter Group	Parameter(s)	Category	Detail/Sample(s)	Comment/Rationale
VOC	Bromomethane Vinyl Chloride	Parameters with existing SCS but RL exceedances only	One sample from BH07-67 in 2007 (Lab report 07T209831)	One sample of 126 contained RL exceedances for the noted VOCs. Laboratory report indicated adjusted detection limits because of co-eluting interferences (i.e., interfering peaks on the VOC method) preventing the determination of the presence or absence of the VOC analytes (greater or less than regular detection limits). The remaining 125 samples, including one sample collected at a deeper interval at the same location, had nondetected concentrations of these parameters. Based on the available information, these parameters were determined to likely not be present at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, they were not considered to be a COC for the Site.
VOC	Dichloromethane	Parameters with existing SCS but RL exceedances only	One sample from MW17-107S-0.5-2 with an RL exceedance (Lab report L2007635)	One sample of 126 contained RL exceedances for the noted VOC. Laboratory report indicated adjusted detection limits because of co-eluting interferences (i.e., interfering peaks on the VOC method) preventing the determination of the presence or absence of the VOC analytes (greater or less than regular detection limits). The remaining 125 samples had nondetected concentrations of this parameter. Based on the available information, this parameter was determined to likely not be present at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, it was not considered to be a COC for the Site.
VOC	Bromodichloromethane Chloroform	Parameters with existing SCS but RL exceedances only	One sample from BH20-214 with and RL exceedance in soil (Lab report L2419793)	One sample of 126 contained RL exceedances for the noted VOCs. The laboratory report indicated that detection limits were raised because of interference from volatile hydrocarbons on the VOC method; therefore, chromatographic elution of interfering peaks in the same region as the test analytes prevented a determination of whether the analyte was present or absent with respect to the regular detection limits. Concentrations of these VOCs have not been detected elsewhere on the Site. Based on the available information, this parameter was determined to likely not be present at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, it was not considered to be a COC for the Site.

Notes:
The rationale for exclusion of COCs listed in this table is based on the data collected as part of the ESA and only applies to this ESA.
µg/g = microgram per gram
ABN = acid, base, and neutral compound
APEC = area of potential environmental concern
COC = contaminant of concern
COPC = contaminant of potential concern
CP = chlorophenol
ESA = Environmental Site Assessment
mbgs = metre(s) below ground surface
RL = laboratory reporting limit
MECP = Ontario Ministry of the Environment, Conservation and Parks
BNA = base, neutral, and acid compound
No. = number
OCP = organochlorine pesticide
PAH = polycyclic aromatic hydrocarbon
PCA = potentially contaminating activity
PCB = polychlorinated biphenyl
PHC = petroleum hydrocarbon
QPESA = MECP Qualified Person for Environmental Site Assessment
RSC = Record of Site Condition
SCS = Site Condition Standards
VOC = volatile organic compound

Table 6-10b. Rationale for the Removal of Groundwater COCs

Phase Two Environmental Site Assessment, 200 Beverley Street, Guelph, Ontario

Parameter Group	Parameter	Category	Sample(s)	Comment/Rationale
ABN	1,1'-Biphenyl	Parameters with existing SCS but RL exceedances only	OW23S RL exceedance in 2014 (Lab report B4J8984 from Maxxam)	1,1-Biphenyl was run as part of a historical PAH laboratory scan and was not a targeted as a COC for the area. No detected concentrations of 1,1'-biphenyl have been reported at the Site. The raised RL is likely due to LNAPL interference, as there has been consistent measurement of free product in this well. The remaining 44 locations where 1,1-biphenyl was analyzed did not report detected concentrations, and RLs met the SCS. Based on the available information, this parameter was determined to likely not be present at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, it was not considered to be a COC for the Phase Two Property.
BTEX	Benzene Ethylbenzene	Parameters with existing SCS and both RL and detected exceedances	OW24D RL exceedances in 2010, 2011, 2012, 2014, and 2015.	The VOC parameters noted had RLs exceeding the SCS at OW24D from samples collected between 2010 and 2015. Laboratory reports indicated that detection limits were adjusted, as the sample required dilution because of high concentrations of other target analytes (review indicated PHC F1 and chlorinated VOCs were up to 5,400 µg/L). Samples collected in 2017 and 2020 from OW24D had nondetect concentrations reported with RLs meeting the SCS. Based on the available information, these parameters were determined to likely not be present at OW24D at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, they were not carried through for the dataset for the Risk Assessment. The parameters were retained as a COCs for the Phase Two Property based on other locations exceeding the SCS.
BTEX	Toluene Xylenes	Parameters with existing SCS but RL exceedances only	OW24D RL exceedances in 2010, 2011, 2012, 2014, and 2015.	Groundwater samples from OW24D had raised RLs for six events between 2010 and 2015. Toluene RLs exceeded the SCS. The raised xylene RLs met the SCS. Laboratory reports indicated that detection limits were adjusted, as the sample required dilution because of high concentrations of other target analytes (review indicated PHC F1 and chlorinated VOCs were up to 5,400 µg/L). Samples from this location taken in 2017 and 2020 did not have raised RLs, which met the SCS. Toluene and xylenes met the SCS at the other locations on the Phase Two Property. Based on the available information these parameters were determined to likely not be present at OW24D at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, these parameters were not considered to be COCs for the Phase Two Property.
CHEMISTRY	Alkalinity, Bicarbonate (as CaCO3), Alkalinity, Total (as CaCO3), Calcium, Fluoride, Iron, Manganese, Potassium	Parameters with no Table 6 SCS but exceeds the PGMIS value	All samples analyzed (range from 2012 to 2016)	Chemistry parameters (pH, conductivity, alkalinity, specific conductance) and major ions (fluoride, chloride, nitrate, nitrite, bromide, phosphate, sulfate, calcium, potassium, manganese, sodium) were introduced into the annual groundwater monitoring program in 2010 and analyzed for until 2016. Iron was included in analytical suites in 2012 to 2014 and 2016. Alkalinity (both bicarbonate and total) exceeded the PGMIS value of 55,000 µg/L in each of the 134 samples and ranged from 250,000 to 550,000 µg/L. Calcium exceeded the PGMIS value of 431,000 µg/L in one of 134 samples, with a concentration of 440,000 µg/L. Fluoride exceeded the PGMIS value of 2,090 µg/L in 11 of 77 samples with concentrations up to 3,900 µg/L. Iron exceeded the PGMIS value of 4,090 µg/L in 7 of 58 samples, with concentrations up to 8,900 µg/L. Manganese exceeded the PGMIS value of 717 µg/L in 4 of 58 samples, with concentrations up to 1,200 µg/L. Potassium exceeded the PGMIS value of 20,700 µg/L in one of 134 samples, with a concentration of 30,600 µg/L. Rationale was not provided for the analyses of these parameters, as they were not required under the MOE Provincial Order that the annual groundwater monitoring was conducted under. Parameters analyzed were those typically collected for monitoring geochemical conditions in groundwater for potential remediation options or the occurrence of degradation or attenuation of contaminants. As these parameters were not identified as COPCs on the Site or associated with an APEC on the Site, at the discretion of the QPESA, they were not considered to be COCs.
CHEMISTRY	Ammonia, Electrical Conductivity, Specific conductance, Bromide	Parameters with no Table 6 SCS or PGMIS value, but have detected concentrations	All samples analyzed (range from 2012 to 2016)	Chemistry parameters (pH, conductivity, alkalinity, specific conductance) and major ions (fluoride, chloride, nitrate, nitrite, bromide, phosphate, sulfate, calcium, potassium, manganese, sodium) were introduced into the annual groundwater monitoring program in 2010 and analyzed for until 2016. Ammonia was included in the analytical suites from 2012 to 2014. Ammonia had detected concentrations in 41 of 57 samples collected, with concentrations up to 1,750 µg/L. Bromide had detected concentrations in one of 77 samples collected, with a concentration of 1,000 µg/L (at the detection limit). Electrical conductivity ranged from 0.5 to 2.0 mS/cm. Specific conductance ranged from 500 to 1,800 µmhos/cm. Rationale was not provided for the analyses of these parameters, as they were not required under the MOE Provincial Order that the annual groundwater monitoring was conducted under. Parameters analyzed were those typically collected for monitoring geochemical conditions in groundwater for potential remediation options or the occurrence of degradation or attenuation of contaminants. As these parameters were not identified as COPCs on the Site or associated with an APEC on the Site, at the discretion of the QPESA, they were not considered to be COCs.

Table 6-10b. Rationale for the Removal of Groundwater COCs

Phase Two Environmental Site Assessment, 200 Beverley Street, Guelph, Ontario

Parameter Group	Parameter	Category	Sample(s)	Comment/Rationale
CHEMISTRY/ METALS	Silica (as SIO2), Sulfur, Cesium (Cs), Lithium, Rubidium (Rd), Silicon, Tin	Parameters with no Table 6 SCS or PGMIS value, but have detected concentrations	One sample from OW31 from September 2016 (Lab report L1830739)	A full metals suite was run for the groundwater sampling completed in 2016 at OW31. A number of parameters did not have SCS values or PGMIS values to compare concentrations. Detected concentrations can occur naturally; however, background concentrations for these parameters in groundwater have not been documented in Ontario. As these parameters were not identified as COPCs on the Site or associated with an APEC on the Site, at the discretion of the QPESA, they were not considered to be COCs.
PAH	Acenaphthylene	Parameters with existing SCS but RL exceedances only	OW23S and OW22S with RL exceedances from 2012 to 2016.	Groundwater samples from OW23S (5 samples) and OW22S (1 sample) had raised RLs for up to five events between 2012 and 2016. Laboratory reports noted that detection limits were adjusted as the sample required dilution due to the nature of the sample matrix. The raised RL at OW23S is likely due to LNAPL interference, as there has been consistent measurement of free product in this well. Samples taken at OW23S (parent and duplicate) in 2018 reported detected concentrations less than the SCS. The other samples collected at OW22S met the SCS (2012 to 2015, and 2017). The remaining 184 samples collected from other locations on the Site had concentrations less than the SCS (7 samples) or nondetected concentrations, with RLs meeting the SCS of 1 µg/L. Based on the available information, this parameter was determined to likely not be present at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, it was not considered to be COCs for the Phase Two Property.
PAH	Benzo(g,h,i)perylene Dibenzo(a,h)anthracene Indeno(1,2,3-Cd)Pyrene	Parameters with existing SCS but RL exceedances only	8 samples from 3 locations (OW22S, OW23S, OW25) with RL exceedances of the SCS from between 2011 to 2016.	Groundwater samples from OW23S (5 samples), OW22S (2 samples) and OW25 (1 sample) had raised RLs for up to five events between 2011 and 2016. Some of the laboratory reports noted that detection limits were adjusted, as the sample required dilution because of the nature of the sample matrix, and it is likely that all eight samples required dilution, causing the detection limits to be adjusted accordingly. The raised RL at OW23S is likely due to LNAPL interference, as there has been consistent measurement of free product in this well. Samples taken at OW23S in 2018 reported detected concentrations less than the SCS. The other samples collected at OW22S (2013 to 2015, and 2017) and OW25 (2010 to 2019) met the SCS. The remaining 169 samples collected from other locations on the Site had concentrations less than the SCS (7 samples) or nondetect concentrations, with RLs meeting the SCS of 0.2 µg/L. Based on the available information, these parameters were determined to likely not be present at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, they were not considered to be COCs for the Phase Two Property.
SVOC	Benzo(e)pyrene	Parameters with no Table 6 SCS or PGMIS value, but have detected concentrations	1 sample from OW22S with a detected concentration in 2013	One of 15 samples (only analyzed in 2013) had a detected concentration of 0.065 µg/L of benzo(e)pyrene. Benzo(e)pyrene was run as part of a historical PAH laboratory scan and was not a targeted as a COC for the area. The remaining 14 locations where benzo(e)pyrene was analyzed did not report detected concentrations. As this parameter was not identified as COPCs on the Site or associated with an APEC on the Site, at the discretion of the QPESA, it was not considered to be COCs for the Phase Two Property.
VOC	1,1,1,2-Tetrachloroethane 1,1,2,2-Tetrachloroethane 1,1,2-Trichloroethane 1,2-Dibromoethane 1,2-Dichlorobenzene 1,2-Dichloroethane 1,2-Dichloropropane 1,3-Dichloropropene 1,4-Dichlorobenzene Bromoform Bromomethane Carbon tetrachloride Styrene	Parameters with existing SCS but RL exceedances only	All samples with RL exceedances between 2010 and 2015	VOC parameters noted had RL exceedances in a number of samples between 2010 and 2015. These locations were resampled in 2017 and 2018 and had reported nondetect concentrations, with RLs meeting the SCS. No other locations reported exceedances of the SCS for these parameters. Based on the available information, these parameters were determined to likely not be present at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, they were not considered to be COCs for the Phase Two Property.
VOC	1,3-Dichlorobenzene 2-Butanone Acetone Chlorobenzene	Parameters with existing SCS but RL exceedances only	OW24D RL exceedances in 2015	One sample collected at OW24D had RL exceedances for each of the noted VOCs in 2015. The other samples collected from this location between 2010 and 2018 (seven events) reported nondetect concentrations with RLs meeting the SCS. Samples collected on the Phase Two Property had nondetected concentrations of the noted VOCs, with the exception of two samples that had detected concentrations of acetone less than the SCS. Laboratory reports indicated that detection limits were adjusted, as the sample required dilution because of high concentrations of other target analytes. Based on the available information, these parameters were determined to likely not be present at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, they were not considered to be COCs for the Phase Two Property.

Table 6-10b. Rationale for the Removal of Groundwater COCs

Phase Two Environmental Site Assessment, 200 Beverley Street, Guelph, Ontario

Parameter Group	Parameter	Category	Sample(s)	Comment/Rationale
VOC	4-Methyl-2-Pentanone Chlorodibromomethane Bromodichloromethane Dichloromethane Methyl tert-butyl ether (MTBE)	Parameters with existing SCS but RL exceedances only	OW24D RL exceedances of the SCS in 2010, 2011, 2012, 2014, and 2015.	Six samples collected from OW24D had RL exceedances for each of the noted VOCs between 2010 and 2015. Samples from 2016 and 2017 reported nondetect concentrations with RLs meeting the SCS. The remaining samples on the Phase Two Property also had nondetected concentrations of the noted VOCs less than the SCS. Laboratory reports indicated that detection limits were adjusted, as the sample required dilution because of high concentrations of other target analytes. Based on the available information, these parameters were determined to likely not be present at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, they were not considered to be COCs for the Phase Two Property.
VOC	1,1,1-Trichloroethane 1,1-Dichloroethane	Parameters with existing SCS and both RL and detected exceedances	Samples from OW24D with RL exceedances between 2010 and 2015	VOC parameters noted had RLs exceeding the SCS at OW24D from samples collected between 2010 and 2015. Detected exceedances were noted elsewhere on the property: 1,1,1-trichloroethane exceeded the SCS at OW12; 1,1-dichloroethane exceeded the SCS at OW26S; both more than 200 metres away (downgradient) on the western portion of the property. Samples collected in 2017 and 2018 from OW24D had nondetect concentrations reported with RLs meeting the SCS. Based on the available information, these parameters were determined to likely not be present at OW24D at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, the elevated RLs were not carried through for the dataset for the Risk Assessment. The parameters were retained as a COCs for the Phase Two Property based on other locations exceeding the SCS.
VOC	n-Hexane Tetrachloroethene	Parameters with existing SCS and both RL and detected exceedances	Samples with RL exceedances between 2010 and 2015	N-hexane had noted RLs exceeding the SCS from several samples collected between 2010 and 2015. Detected exceedances were only noted at MW17-105S for n-hexane and OW19 and MW17-107S for tetrachloroethene. Locations with RLs only exceeding the SCS had samples meeting the SCS in two or more other sampling events. Based on the available information, these parameters were determined to likely not be present at concentrations exceeding the SCS at the locations with the elevated RLs; therefore, at the discretion of the QPESA, the elevated RLs were not carried through for the dataset for the Risk Assessment. These parameters were retained as a COC for the Phase Two Property based on other locations exceeding the SCS.
VOC	1,1,2,2-Tetrachloroethane 1,1,2-Trichloroethane 1,2-Dibromoethane	Parameters with existing SCS but RL exceedances only	Two samples from OW22S has RL exceedances of the SCS in 2017 and 2018.	These VOCs had elevated RLs in two samples collected in 2017 and 2018. Both the laboratory reports noted that the detection limits were adjusted because of "to interference from volatile hydrocarbons on VOC method. Chromatographic elution of interfering peaks in the same region as test analytes prevents a determination of whether VOC analyte is present or absent (above/below regular detection limits)." The RLs for these VOCs met the SCS in three prior sampling events at this location. Based on the available information, these parameters were determined to likely not be present at OW22S at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, they were not considered to be COCs for the Phase Two Property.
VOC	Chloroform	Parameters with existing SCS but RL exceedances and detected exceedances	14 samples from 5 locations had RL exceedances of the SCS from 2010 to 2015.	Fourteen of 365 samples analyzed for chloroform had RL exceedances of the SCS. Of the remaining samples, 340 had nondetected concentrations below the SCS, and 9 had detected concentrations below the SCS. Some of the laboratory reports noted that detection limits were adjusted, as the sample required dilution because of high concentrations of other target analytes. Because of the presence of high concentrations of VOCs on the Site, it is likely that the samples required dilution, causing the detection limits to be adjusted accordingly. Based on the available information, this parameter was determined to likely not be present at concentrations exceeding the SCS; however, one location (MW18-112D) reported a detected concentration above the SCS in 2018. See Table 6-10c for further discussion of chloroform as a COC for the Phase Two Property.

Notes:

The rationale for exclusion of COCs listed in this table is based on the data collected as part of the ESA and only applies to this ESA.

µg/L = micrograms per gram
ABN = acid, base, and neutral compound
APEC = area of potential environmental concern
COC = contaminant of concern
COPC = contaminant of potential concern
CP = chlorophenol
ESA = Environmental Site Assessment
mbgs = metre(s) below ground surface
RL = laboratory reporting limit
MECP = Ontario Ministry of the Environment, Conservation and Parks
No. = number
OCP = organochlorine pesticide
PAH = polycyclic aromatic hydrocarbon
PCA = potentially contaminating activity
PCB = polychlorinated biphenyl
PHC = petroleum hydrocarbon
QPESA = MECP Qualified Person for Environmental Site Assessment
RSC = Record of Site Condition
SCS = Site Condition Standards
µmhos/cm = micromho(s) per centimetre
VOC = volatile organic compound

Phase Two Conceptual Site Model

Based on recent and historical Phase Two Environmental Site Assessment (ESA) work completed at 200 Beverley Street (Phase Two Property or Site) in Guelph, Ontario, a Phase Two CSM is provided and discussed in this appendix, as required under Ontario Regulation (O. Reg.) 153/04 (MECP 2011a). The Site is located east of downtown Guelph, Ontario, and is approximately 5.2 hectares (ha) in size. The Site currently consists of vacant land historically used for industrial purposes. All onsite buildings have been razed, with concrete floor slabs still in place. The location of the Phase Two Property is shown on Figure 2-1, and a more detailed Site Plan is shown on Figure 2-2.

1.1 Potentially Contaminating Activities

The Phase One ESA (CH2M 2017) identified 77 potentially contaminating activities (PCAs) resulting in 33 areas of potential environmental concern (APECs). The following PCAs were identified during the Phase One ESA (CH2M 2017) on the Phase Two Property, and resulted in an APEC:

- 8 – Chemical Manufacturing, Processing, and Bulk Storage
- 27 – Garages and Maintenance and Repair of Railcars, Marine Vehicles, and Aviation Vehicles
- 28 – Gasoline and Associated Products Storage in Fixed Tanks
- 30 – Importation of Fill Material of Unknown Quality
- 32 – Iron and Steel Manufacturing and Processing
- 33 – Metal Treatment, Coating, Plating and Finishing
- 34 – Metal Fabrication
- 39 – Paints Manufacturing, Processing or Bulk Storage
- 46 – Rail Yard, Tracks, and Spurs
- 55 – Transformer Manufacturing, Processing and Use

The following PCAs were identified during the Phase One ESA (CH2M 2017) outside the Phase Two Property, but within the Phase One Study Area:

- 8 – Chemical Manufacturing, Processing, and Bulk Storage
- 10 – Commercial Autobody Shops
- 11 – Commercial Trucking and Container Terminals
- 12 – Concrete, Cement and Lime Manufacturing
- 27 – Garages and Maintenance and Repair of Railcars, Marine Vehicles, and Aviation Vehicles
- 28 – Gasoline and Associated Products Storage in Fixed Tanks
- 33 – Metal Treatment, Coating, Plating and Finishing
- 34 – Metal Fabrication
- 39 – Paints Manufacturing, Processing or Bulk Storage
- 43 – Plastics (including Fiberglass) Manufacturing and Processing
- 45 – Pulp, Paper and Paperboard Manufacturing and Processing
- 46 – Rail Yard, Tracks, and Spurs
- 49 – Salvage Yard, including Automobile Wrecking
- 55 – Transformer Manufacturing, Processing and Use
- 57 – Vehicles and Associated Parts Manufacturing

1.2 Areas of Potential Environmental Concern

As indicated, the Phase One ESA (CH2M 2017) identified several PCAs that resulted in APECs for the Phase Two ESA. As summarized from the Phase One ESA, 33 APECs were identified on the Site, with

29 attributable to onsite PCAs, and 4 APECs attributable to offsite PCAs located within 250 metres (m) of the Phase Two Property.

The following APECs were identified for the Phase Two Property:

1) Foundry - A foundry was operated on the site by IMICO from 1913 to 1989 when the plant closed and was abandoned. The foundry operated as an iron-jobbing facility for the production of various metallic forms using malleable and ductile iron (DCS 2014). Foundry sands were predominantly located in the concrete pits and sumps of the main foundry building. Foundry sands, sludge materials, and process waste were removed from the site and buildings were demolished in 1999 (Earth Tech 1999). The Proctor & Redfern (P&R) investigation also reported that moulding sands and dust collector waste was stored at the northwestern corner of the building and drained to the truck bay (P&R 1991).

2) Machine Shop - A machine shop was shown on the 1916 fire insurance plan (FIP), east of the original foundry. The northern one-third of the Machine Shop was identified for 'Tumbling and Cleaning' operations, inferred to be in association with the adjacent 'Annealing Room' to the north. FIPs prepared in 1929, 1945, and 1960 showed this area changed operations to 'Shipping' and a 'Pattern Shop.'

3) Annealing - An 'Annealing Room' with four furnaces is shown on the 1916 FIP. A brick chimney is located on the northern wall. The 1929 FIP shows nine furnaces with the Annealing Room extended westward with an additional chimney on the north wall within the extended area; the southern portion of the Annealing Room is identified as the 'Tumbling Dep't.' The 1946 FIP shows a structural addition on the east side of the Annealing Room, with two additional furnaces. The 1960 FIP shows further eastward expansion and the addition of a third furnace. Tumbling Dep't operations appear consistent in location and footprint, from 1929 through to 1960. The furnaces are inferred to be coal fired from 1916 through to 1960, based on the nearby coal storage areas shown on the 1946 and 1960 FIPs, and the absence of aboveground storage tanks (ASTs) or underground storage tanks (USTs) for fuel oil storage on any of the FIPs. The furnace fuel from after 1960 to the end of operations in 1989 is not known, but a period of fuel oil fired furnace operation is suspected; see APEC 7. No information was identified to suggest coal or fuel oil storage within the Annealing Room; however, no information regarding temporary furnace fuel storage, transmission or waste disposal was identified. Dust control equipment is shown on Figure 4 of the 1991 P&R report, on the northern side of the Annealing Room.

4) Sand Storage - The 1916 FIP shows a 'Sand Shed.' The 1929 and 1946 FIPs again show the Sand Shed, plus a second smaller building to the west labelled 'Sand.' The 1960 FIP shows the original 'Sand Shed' as 'Bricks' and the second smaller building to the west labelled as 'Sand & Bricks,' and an additional area to the north labeled 'Sand'. No information was identified to indicate if only clean process, spent foundry sands or both were stored in these buildings, therefore the potential storage of spent foundry sand in these buildings is considered. The purpose and types of bricks stored was not identified. The potential for new and used refractory brick and associated process materials is considered possible.

5) Galvanizing Building - A small free-standing building for 'Galvanizing' was present on the south east portion of the Site as shown on the 1916, 1929, and 1946 FIPs. The Galvanizing building was not shown on the 1960 FIP, with the area occupied by a larger new structure identified as 'Fittings Whse' (warehouse). No information was identified regarding process chemical use and storage, or waste management practices, in association with the galvanizing operations conducted.

6) Chipping/Grinding Room - A 'Chipping Room' was shown on the FIPs prepared in 1929, 1946, and 1960, located west of the Annealing area. The 1916 FIP shows this as exterior yard area west of

the 'Annealing Rm', with a small outbuilding that appears to be connected to the Annealing Room with a linear underground feature. The 1991 P&R report identified this as a 'Trimming and Grinding' area; this information inferred to be based on the interview of historical IMICO employees. 'Dust control equipment' is shown on Figure 4 of the 1991 P&R report, on the exterior western side of the building.

7) Oil Houses, Boiler House and ASTs - A building is shown on the 1929 FIP to the north of the Foundry and east of the power house with a label "Oil," and an additional building with the same label is shown to the north of this original building on the 1946 FIP. The 1960 FIP shows the northern building remaining but is not labelled as an oil house. The 1916 FIP shows this as empty exterior yard area north of the foundry. The P&R Investigation figures show a boiler house to the east of the power house, and two 45,000-litre (L) (10,000 gallon) oil tanks to the east of the building with "no history of leaks or spills" (P&R 1991). One 45,000-L AST was reported removed in 1998 during demolition activities and had been used to store Bunker C fuel. The removed AST had been located east of the Core Room (Earth Tech 1999).

8) Gasoline UST - As indicated on the 1960 FIP, a gasoline UST is shown north of a small office building, and west of 'scales' at the corner of Kingsmill Avenue and Beverley Street. The area is empty exterior yard area on the 1916 FIP, and the 1929 and 1946 FIPs show the office (labelled as a 'time office') but does not show the UST. The gasoline use is not known; however, it is inferred to be for fueling gasoline-powered equipment/vehicles used at the plant. The 1991 P&R investigation reported that an IMICO employee indicated the UST was removed in the mid-1980s in response to a request from the City of Guelph due to gasoline vapours in the sewers along Beverley and York Streets. No significant contamination was reported (P&R 1991).

9) Oil House - A building is shown on the 1929 and 1949 FIP to the south of the Foundry and west of the galvanizing building with a label "Oil." The building/structure is not on 1916 FIP where the area is shown as exterior yard area and is not present on the 1960 FIP where the area is occupied.

10) Machine Shop - A machine shop is shown on the 1929, 1946, and 1960 FIPs, east of the original foundry building. The floor is indicated as concrete. Machine shop cuttings were stored on the ground north of the building, and two small ceiling mounted oil tanks were present in the building as noted in the P&R investigation (1991). The area is shown on the 1916 FIP as exterior yard area, with a small unidentified building in the central area of the future machine shop. The northern portion of the machine shop was removed during the 1999 excavation based on the excavation footprint (EarthTech 1999).

11) Plating/Galvanizing Building - A galvanizing building was present on the Site as shown on the 1946 and 1960 FIP. The previous FIPs (1916 and 1929) show this as exterior yard area. On subsequent site plans (P&R 1991; Earth Tech 1999), the building was identified as a storage shed and reported as having been used for dip galvanizing before 1975, with rinse water discharged into "dry wells" north of the building (P&R, 1991). Investigations by P&R and Gartner Lee indicated high concentrations of zinc, other metals, and oil and grease. Free product was observed wells (OW01-I, OW20, OW21). The area was excavated to bedrock (ranging from 1.3 to 2.0 metres below ground surface [mbgs] and approximately 9,400 tonnes of contaminated soil and 925 tonnes of contaminated concrete were removed. Soil samples were collected from the final limits of the excavation walls and indicated most locations having zinc and TPH concentrations above the Table A Guidelines. The excavation was backfilled with granular "B" materials. A single sample was collected from the backfill and met the guidelines applicable at the time of the report (Earth Tech 1999). A well nest (OW22S/D) was installed within the excavation area (the report for this installation was not available and therefore the soil conditions are unknown if analyzed as part of the investigation). Testpits and boreholes installed in the area in 2013 by DCS indicated soils

having high zinc and other metal concentrations. Groundwater conditions at OW22S reported free product which was highly weathered with a slight oil/diesel odour (as reported in the summary of the Gartner Lee 2000/2001 investigation in DCS 2007). Borehole logs for OW22S/D indicate the presence of fuel/diesel type odour in the fill which extends to approximately 1.5 mbgs; and hydrocarbon odour extending into the underlying bedrock with black staining on fractures. Groundwater sampled from OW22S has not since reported free product but has had concentrations of PHCs increasing since the annual monitoring at this location began in 2016, up to 850,000 micrograms per litre (µg/L) of fraction (F)3. Zinc concentrations have widely fluctuated over the years and have exceeded in approximately 25 percent of the sampling events between 2005 and 2016.

12) Coal Storage - A coal shed is shown on the 1946 FIP, to the north of the foundry and west of the powerhouse. A larger coal storage area is shown on the 1960 FIP, and the building is extended south to connect with the foundry on subsequent site plans (P&R 1991; GLL 1999, Earth Tech 1999) without an indication of its use. The previous FIPs (1916 and 1929) show this area as exterior yard area.

13) Rail Line - A former rail line was shown onsite north of the buildings on the 1916, 1929, and 1946 FIPs, running east to west, for the full length of the foundry building. On the 1960 FIP, the western portion was shown to have been removed, to accommodate the newly constructed shipping/stock room; the rail siding ended at the eastern side of the building. It is inferred that raw materials and finished products were shipped by rail.

14) Possible Automobile Storage, Maintenance and Repair - An addition south of the foundry building, on the east side of the offices, is labeled "Auto" on the 1960 FIP. Previous FIPs (1916, 1929, 1946) show this as exterior yard area.

15) Sand Mixing/Storage - Sand mixing is shown in a building north of the foundry as shown on the 1960 FIP. Previous FIPs (1916, 1929, 1946) show this as exterior yard area, north of the foundry. Subsequent site plans (P&R 1991; GLL 1999; Earth Tech 1999) do not have an indication of the buildings' use.

16) Transformers - Transformers are first shown on the 1960 FIP, north of the powerhouse. Previous FIPS (1916, 1929, 1946) show this as exterior yard area north of the power house. Transformers of this era may have contained polychlorinated biphenyls (PCBs).

17) Capacitor Room - PCB-containing capacitors were present in the centre of the foundry, as first shown on the P&R investigation site plan, and later remediated as part of the Earth Tech demolition (P&R 1991; Earth Tech 1999). Activities included removal of a concrete floor, a utility trench located in the eastern section (concrete walls, granular base) that was heavily stained, a subfloor was present in the central section, and a sump located in on the eastern portion of the capacitor room that were all indicated as PCB-impacted and excavated and disposed offsite. The area was excavated to bedrock (1.0 to 1.3 mbgs) to remove concentrations above 5 micrograms per gram (µg/g). Final samples (composite soil, soil, concrete and bedrock) from the limits of excavation in the capacitor room reported PCB concentrations under 5 µg/g, with the exception of two bedrock samples within the eastern sump area that had concentrations around 10 µg/g. A well (OW25) was installed within the excavation area (the report for this installation was not available and therefore the soil conditions are unknown if analyzed as part of the investigation) and subsequent groundwater monitoring of the area have indicated concentrations of chlorinated volatile organic compounds (VOCs) and petroleum hydrocarbons (PHCs) (mainly F3) exceeding the applicable potable water criteria (Table 6 Standards) (DCS 2007, 2014; AECOM 2017a; 2017b).

18) Coal Storage - A building for coal storage is shown on the 1960 FIP, to the north of the annealing room, with additional 'coal piled' to the west of the building. Previous FIPs (1916, 1929, 1946) show this as exterior yard area to the north of the annealing room. The coal is inferred to be used in the furnaces in the annealing room. Subsequent site plans show this as a storage area (P&R 1991, DCS 2007).

19) Coal Storage - A small building for coal storage is shown on the 1960 FIP, east of the time keepers office at the Beverley Street entrance. The building is not present on previous FIPs (1916, 1929, 1946) and is shown as exterior yard area.

20) Garage - A garage was shown on the 1946 and 1960 FIP along Stevenson, on the western side of the property. The building is not present on previous FIPs (1916, 1929) and is shown as exterior yard area. The site investigation by P&R (1991) identified visual impacts to the soils south of the garage. Some elevated PCB concentrations were found in soil during subsequent investigations.

21) Coal Storage - The 1960 FIP indicates coal storage south of the garage on the western side of the Site. The building is not present on previous FIPs (1916, 1929) and is shown as exterior yard area, and on the 1946 FIP, the building is not labelled as coal.

22) Transformer - A 1,200-volt transformer is shown on the 1991 Site Plan (P&R 1991).

23) Paint Shop - First shown on the P&R Site plan, a paint shop was located at the northern end of the Site, between the shipping building and the storage area (P&R 1991). Drums were stored against the northern wall for materials used in the paint shop. The FIPs show this area as exterior yard area in the early FIPs (1916, 1929, 1946) and empty space between existing buildings in the 1960 FIP.

24) PCB Storage Area - An area located at the northeastern corner of the Finishing and Annealing Room, with a concrete pad was identified in the Earth Tech investigation as a former PCB Storage area. Concentrations exceeding 50 parts per million (ppm) of PCBs were identified. Previous Site maps showed this area as 'storage' (P&R 1991) or part of the Annealing Room (1946 and 1960 FIPs). During the demolition activities, approximately 250 kilograms (kg) of PCB-containing ash residue from the top of the concrete pad, and the concrete pad itself was removed and taken for offsite disposal (Earth Tech 1999). Confirmatory samples below the pad were 0.63 and <0.05 µg/g. The soil was later excavated to bedrock as part of the soil remediation in the northeastern corner of the property (see APEC-11).

25) Drum Storage - Interviews with former employees as part of the P&R investigation identified drum storage activities e along the nortrnh property boundary (P&R 1991). No additional information was provided on the nature of what was stored and whether there was any associated contamination as a result of the materials.

26) Former Substation - A former substation is indicated on the P&R (1991) and Earth Tech (1999) Site plans. A sample of transformer oil from the former substation analyzed in the Earth Tech report indicated nondetect concentrations of PCBs. Similarly, one location installed during the DCS Phase II ESA (2007) indicated non-detect PCB concentration. Previous Site plans (FIPs) show this area as exterior yard areas.

27) Former Electrical Shop - A small electrical shop was noted to be on the southwestern corner of the foundry (P&R 1991). This addition was not shown on the FIPs from previous years and was shown as the exterior yard area west of the foundry.

28) Waste Oil Storage - Used oil was stored above ground on the southwest end of the foundry as shown on the P&R Site plan (P&R 1991).

29) Fill of Unknown Quality - All areas of the Site have a layer of fill above the native silty sands. Previous investigations have indicated a layer of fill consisting of foundry sands, slag, and cinders (extending to 1.0 m) was found across the Site (P&R 1991) and the fill to be mix of foundry operation waste such as "coal, clinker, ash, metals and detritus from the former foundry operations" and reworked native from "reworking onsite soils as a result of initial construction and subsequent expansion activities" (DCS 2007). The yard areas were additionally noted to have been oiled (presumably engine oil) (P&R 1991).

30) Potential Offsite Impacts from the North – Historical and current operations on properties to the north have the potential to impact the Phase Two Property, including the following:

- Rail lines
- Paper manufacturing
- Auto body repair shop
- Automobile repair
- Gasoline station
- Trucking company
- Concrete products manufacturing
- Wire/spring manufacturing
- Metal valve manufacturing
- Former spill
- Electroplating company
- Window and door manufacturing
- Scrap yard

31) Potential Offsite Impacts from the East – Historical and current operations on properties to the east have the potential to impact the Phase Two Property, including the following:

- Steel valve manufacturing
- Former stove manufacturer/foundry
- Box manufacturing
- Potential USTs
- Scrap yard
- Former fuel storage facility
- Former pain application
- Chemical manufacturer or distributor
- Transformers

32) Potential Offsite Impacts from the South – Historical and current operations on properties to the south have the potential to impact the Phase Two Property, including the following:

- Screw manufacturing
- Former USTs
- Former transportation company

33) Potential Offsite Impacts from the West – Historical and current operations on properties to the west have the potential to impact the Phase Two Property, including the following:

- Window manufacturing
- Metal treatment
- Spring manufacturing
- Former refractory facility
- Motor vehicle parts manufacturing
- Former spill

Table 6-4 describes the APECs and associated PCAs. Figures 4-1a and 4-1b present the location of the onsite and offsite APECs and PCAs, respectively, along with the locations of boreholes, test pits, and monitoring wells advanced as part of the Phase Two ESA investigations. Figure 4-2 shows the locations of all identified APECs. As summarized in Table 6-4, the APECs occurring on the Phase Two Property have been thoroughly investigated for all associated contaminants of concern (COCs).

1.3 Subsurface Utilities and Construction Features

Some concrete foundations, slabs and footings from the former buildings are present on Site, below grade, along with associated building demolition debris (for example, crushed concrete, industrial fill). Although utilities have been disconnected on Site, piping and bedding have not been removed and, therefore, there is a potential for utility corridors to act as preferential route of contaminant migration. The specific locations of former utility corridors are not known. Former building outlines are shown on Figure 2-2.

1.4 Physical Setting

The Phase Two Property is located in the City of Guelph, within the Speed River Subwatershed of the Grand River Watershed. Regional topography (Figure 3-1) is characterized by broad and oblong drumlins (hills) with gentle slopes, with poorly drained till plain valley that are part of the Guelph Drumlin Field (Chapman and Putnam 1984). The Site lies at an average elevation of approximately 315.5 masl, with a topographic high of approximately 316.5 masl at OW13, which lies in the southeastern portion of the Site (Figure 6-1).

On a regional scale, groundwater flows from areas north of Guelph to the south towards Cambridge. Within Guelph, groundwater flow is influenced by groundwater pumping from municipal water supply wells, as well as creek and rivers, including the Speed and Eramosa Rivers.

The site lies approximately 0.5 kilometre (km) north of the Eramosa River, and 1.1 km east of the Speed River, and flow in both rivers is supported by groundwater discharge. A review of the Permit to Take Water database identified 9 Permits to Take Water within one kilometer of the Site, which include an industrial water user north of the Site, remediation wells east of the Site, irrigation use to the south (on the opposite side of the Eramosa River), and dewatering and commercial uses located south-southeast of the Site (MECP, 2020a). A review of Ontario Water Well Records found that 86 water wells exist within 250 m of the property; of these, 16 are listed as Test Holes, 44 are listed as Observation Wells, and the remaining are “Abandoned-Other”. No wells were listed as being for potable use (MECP 2020b).

The nearest municipal groundwater supply wells area as follows:

- Park #1/#2 – 2.0 km northwest
- Emma – 2.5 km northwest
- Clythe Creek – 2.4 km northeast
- Water St. – 2.25 km southwest
- Edinburgh – 2.6 km southwest
- Dean – 2.6 km southwest
- Membro – 2.9 km southwest
- University – 3.0 km south (past Eramosa River)
- Carter In/Out – 2.95 km southeast (past Eramosa River)

The City of Guelph categorizes regions of the City within Wellhead Protection Areas (City of Guelph, 2012). The IMICO site is within Wellhead Protection Area B. The City of Guelph is additionally part of the Grand River Source Protection Plan (Lake Erie Region Source Protection Committee, 2019). The Plan assigns Drinking Water Threat Vulnerability Scores across the region based on various risk factors; the IMICO site is

assigned a Vulnerability Score of 10, the highest possible, indicating it is susceptible to contamination. The site is not located within an Intake Protection Zone (GRCA, 2017).

1.4.1 Stratigraphy

The geology at the Phase Two Property was investigated through historical investigations and the 194 sampling locations (that is, boreholes, monitoring wells, and test pits) advanced as part of the Phase Two ESA activities and historical investigations. The geology beneath the Site characterized during the Phase Two field investigations is summarized in Exhibit 1.

Exhibit 1: Site Stratigraphy

Geological Unit	Description/ Bedrock Member	Approximate Thickness (m)	Lithology
Fill		0.15 to 3.1	Dark brown to black silty sands (like foundry sand) with black ash, brick, cinders, metal and wood debris
Silty Fine Sand		0 to 3.0	Silty fine sand
Eramosa Formation	Stone Road Member	1.7 to 5.8	Cream coloured coarsely crystalline dolostone
	Reformatory Quarry Member	6.4 to 9.6	Brown to black, thinly to thickly bedded, fine to coarse crystalline dolostone
	Vinemount Member	6.4 to 9.6	Dark grey to black, thin bedded, finely crystalline dolostone with shaley beds
Goat Island Formation		> 8.5	Medium to ash grey, chert-rich, finely crystalline dolostone

Note:

> = greater than

The Eramosa and Goat Island Formations underlie the Phase Two Property and the top of bedrock surface was encountered at depths ranging from approximately 1.0 m to 3.4 mbgs (approximately 312.6 to 314.6 metres above sea level [masl]). The upper few metres of bedrock in the area are highly weathered and fractured, and the bedrock becomes increasingly more competent and less fractured with depth below surface.

Eight geologic cross sections were generated to illustrate the stratigraphy beneath the Site. The cross-section locations are shown on Figure 6-1 and cross sections A-A' through H-H’ are presented on Figures 6-1a through 6-1h, respectively.

During the Phase Two ESA, the fill, native silty fine sands and all units of the bedrock from the Eramosa Formation to the Goat Island Formation (Exhibit 1) were investigated. Monitoring wells were instrumented in the upper sands and fractured Stone Road Member bedrock to characterize the water table, and monitoring wells were also installed in the Reformatory Quarry and Vinemount Members of the Eramosa Formation, to characterize the lower bedrock beneath the site. The deepest well onsite extends approximately 33 mbgs (OW31) into the Goat Island Formation.

1.4.2 Hydrogeological Characteristics

Hydrostratigraphic Units: To evaluate groundwater flow directions onsite, the geologic units beneath the site were subdivided into the following three hydrostratigraphic units.

- *Overburden and bedrock contact zone*. This unit is characterized by wells completed in the Stone Road Member of the Eramosa Formation. This hydrostratigraphic unit acts as a local and regional groundwater aquifer with groundwater flow in the upper fractured bedrock influenced by secondary porosity features, such as fractures and solution enhanced vugs and cavities.
- *Eramosa Formation.* Reformatory Quarry and Vinemount Members. Based on review of onsite drill core and our regional understanding of the bedrock formations in the area, the Reformatory Quarry and Vinemount Members of the Eramosa Formation are notably less fractured, and more competent than the overlying Guelph Formation and Stone Road Member of the Eramosa Formation, and they act as a regional aquitard.
- *Goat Island Formation*. The Goat Island Formation is interpreted on a regional scale to act as a regional aquifer beneath the City of Guelph; however, in some areas, the upper member of the Goat Island Formation (Ancaster Member) contains low permeability shaley beds that have similar hydrogeologic properties of the overlying Vinemount Member, and acts as a local aquitard. To be conservative, we have assumed the Goat Island Formation bedrock beneath the site behaves as an aquifer and lies in contact with the underlying Gasport Formation aquifer, which is the City of Guelph's primary water supply aquifer.

The characterization of the hydrostratigraphic units was based on data collected from 95 locations across the Site, which included 37 wells installed in previous investigations, and 58 wells drilled and instrumented in the current investigation between August 2017 and April 2019. The current investigation also included drilling of 19 boreholes and digging of 25 test pits, and assessed the nature of the subsurface from ground surface to a maximum depth of approximately 25 mbgs.

Of the 95 monitoring wells onsite, 57 wells are completed in the uppermost hydrostratigraphic unit (Overburden and bedrock contact zone), 36 in the middle hydrostratigraphic unit (Competent Eramosa Formation) and two in the Goat Island Formation.

Water table elevations collected in August 2018, March 2019 and February 2020 were mapped and are illustrated on Figures 6-2a, 6-2b, and 6-2c, respectively. Within the overburden and contact zone aquifer unit, groundwater flows from a high in the northeastern portion of the Site, to lower water level elevations in the southern and southwestern portions of the site (Figures 6-2a, 6-2b, and 6-2c). Horizontal hydraulic conductivity values estimated from slug tests conducted in monitoring wells screened in this upper hydrostratigraphic unit yielded averaged values of 3.9×10^{-5} metres per second (m/s). The average horizontal hydraulic gradients within this unit were estimated to range from 0.002 to 0.019 m/m in the August 2018, March 2019 and February 2020 snapshots; together with the estimated horizontal geometric mean hydraulic conductivity, and a porosity value in the fractured rock of 0.10 yielded a horizontal velocity that ranged from 25 to 230 metres per year (m/yr).

The water level elevations observed in the ***competent Eramosa Formation bedrock unit*** beneath the Site in August 2018, March 2019 and February 2020 were mapped and are illustrated on Figures 6-2d, 6-2e and 6-2f, respectively. In order to isolate monitoring wells at a consistent elevation, only groundwater wells screened in the Vinemount Member were used for the groundwater contour interpretation. Groundwater level elevations in the Vinemount were observed to be highest in the western portions of the site near MW18-120D and decrease slightly (approximately 0.2 m) to the east to a low elevation at OW13-39D (Figures 6-2d, 6-2e and 6-2f). The geomean horizontal hydraulic conductivity value from two slug tests completed in this layer was 5.7×10^{-7} m/s. This estimate is consistent with the understanding that the Vinemount Member of the Eramosa Formation is a regional aquitard.

Assuming a horizontal hydraulic gradient between 0.0004 and 0.002 m/m, based on the groundwater contours for August 2018, March 2019 and February 2020, a porosity value of 0.01 and a geometric mean hydraulic conductivity value of 5.7×10^{-7} m/s, groundwater in this lower bedrock unit was calculated to move horizontally at a velocity of 0.7-3.5 m/yr through this aquitard unit.

Within the Goat Island Formation bedrock unit, horizontal hydraulic conductivity values estimated from hydraulic tests conducted in June 2018 in OW31, screened across this unit, was estimated to be 3.7×10^{-5} m/s. As only two wells are screened across the Goat Island Formation, groundwater flow directions and gradients were not characterized for this unit.

Vertical gradients were calculated onsite using eighteen monitoring well nests present on the Site. Downward gradients were noted at most wells across the Site on multiple occasions, ranging in magnitude from 0.001 to 0.17 m/m. MW18-112S and MW18-112D and MW18-122D and MW18-122G showed consistent upwards gradients, however. The range of upwards gradients at MW18-112S/D over the monitoring period ranged from 0.010 to 0.015 m/m, while MW18-122D/G exhibited upwards gradients of 0.003 to 0.004 m/m.

Within the upper aquifer, groundwater flow onsite is conceptualized to flow from the north to the southeast and southwest towards the Eramosa River, a groundwater discharge location. Drill cores collected from the Site also showed that horizontal fractures were most common in the upper portions of the bedrock and decreased with depth. The combination of the predominant horizontal fracturing onsite, and the nearby (500 m) Eramosa River groundwater discharge location lead to the horizontal gradients beneath the Site.

Approximate Depth to Bedrock

Depth to bedrock onsite ranges from 1.0 to 3.4 mbgs. The elevation at the top of bedrock is deepest onsite at MW18-127S (312.6 masl) in the central portion of the site and rises to a high of 314.6 masl at OW23D in the eastern portion of the site where the bedrock rises slightly (less than 2 m) in comparison to the bedrock surface observed in the surrounding wells.

Approximate Depth to Water Table

The measured depth to water table collected in August 2018, representing the lowest groundwater elevations observed during the monitoring period, ranged from 1.9 to 4.0 mbgs (312.5 to 313.3 masl) for wells screened in the overburden and contact zone unit. Depth to water in March 2019, representing the highest groundwater elevations at the site, ranged from 1.1 to 3.5 mbgs (312.9 to 314.1 masl). Depths to water table in most recent sampling event (February 2020) ranged from 1.4 to 3.7 mbgs (312.77 to 313.79), which is interpreted to be an approximate average condition for the site.

Water level measurements have been collected in onsite monitoring wells since 2010, and aside from seasonal variability, the depth to water table elevation has remained consistent across the site throughout this period. Considering all 27 water level events (2010 to 2020), the depth to groundwater ranged from 0.93 to 4.97 mbgs, with an average of 2.78 mbgs.

1.5 Applicable Site Condition Standards

O. Reg. 153/04 (MECP, 2011a) under Part XV.1 of the Environmental Protection Act addresses the assessment, cleanup, and filing of an RSC for brownfield sites in Ontario and is applicable to the Phase Two Property. Jacobs evaluated the Site based on a number of criteria to decide which of the generic SCS provided in the Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act (MECP, 2011b), were applicable for a comparison of soil and groundwater results from the Phase Two ESA investigation.

The items in Table 2-3 were considered during the selection of the SCS, as outlined in O. Reg. 153/04 (MECP, 2011a), and are discussed below.

The special conditions for environmentally sensitive areas under Section 41 of O. Reg. 153/04 are not applicable to the Phase Two Property. The RA Property is not considered an area of natural significance or to be within the proximity of an area of natural significance, based on the information reviewed as part of the Phase One ESA (CH2M, 2017). Soil at the Site (based on 106 samples) was found to have pH values between 6.6 and 8.86, within the Ministry's acceptable range (that is, a pH value in surface soil between 5 and 9, or a pH value in subsurface soil between 5 and 11) with the exception of two samples. One of these soil samples with elevated pH was classified as "isolated fill" and is not considered to be representative of soil conditions at the Site. At this location, concrete foundations were noted to be present both above and below the sample, essentially isolating this fill from other overburden soils. As such, this pH result was not considered further for the determination of pH at the Phase Two Property. The second sample (MW17-100S, collected between 0.3 to 0.46 mbgs) where a pH concentration of 9.45 was found was further investigated with BH19-100i, where a sample was collected from within 2 m of the original sampling location, at the same sampling depth as the original sample. The sample reported a pH of 7.71, which when averaged with the original sample, confirms pH at the Site is within the Ministry's acceptable range with a result of 8.0 (sample averaging as per Section 48(2) of the O. Reg. 153/04).

The special conditions for land within 30 metres of a water body under Section 43.1 of O. Reg. 153/04 do not apply to the Phase Two Property; however, as bedrock has been encountered at less than 2 metres below ground surface (DCS, 2014), the special condition for shallow soil properties cited under Section 43.1 of O. Reg. 153/04 applies to the Phase Two Property.

The Phase Two Property, and adjacent properties within 250 m are serviced by a municipal water source. However, as the groundwater in the vicinity of the Property does and will serve as a raw water supply for a drinking water system (understood to be the Gasport Formation as the primary reservoir), a potable groundwater condition was applied.

The current land use is industrial, and the proposed future land use may include residential/parkland and commercial uses, provided an RSC acknowledged by the MECP is obtained. Due to the extensive presence of heterogeneous fill materials across the Site, the standards for coarse-grained soils were considered applicable.

Based on this information, the Table 6: Generic Site Condition Standards for Shallow Soils in a Potable Groundwater Condition for coarse-grained soil and residential/parkland/institutional property use (Table 6 SCS) was applied to the Site.

1.6 Imported Soil

Fill was found to be present across the Phase Two Property and extending from ground surface to a depth of approximately 0.1 to 3.1 mbgs (typically 316.3 to 313.4 masl). The fill materials were defined as coarse, and predominantly comprised of dark brown to black silty sands (like foundry sand) with black ash, brick, cinders, metal and wood debris. The depth of the fill materials ranged from 0.15 m at MW17-105D to 3.1 m at OW31 in the eastern portion of the Site. As discussed in the Phase One ESA (CH2M, 2017), two remedial excavations historically occurred at the Phase Two Property: an area in the northeast corner of the Site (associated with the former galvanizing/plating building) was excavated to bedrock in 1999 (Earth Tech, 1999) and a former capacitator room area in the south-central potion of the Site was also remediated for polychlorinated biphenyls (PCBs) as part of the Earth Tech (1999) demolition activities. Granular "B" material was used to backfill these excavation areas (shown on Figure 6-1) along with former pits and sumps across the Site.

1.7 Locations of Proposed Buildings and Structures

All buildings onsite have been razed; however, the majority of the concrete floors, foundations and footings of historical buildings remain in place. The approximate locations of the former buildings are show on Figure 2-2. Historically, approximately 23 buildings were present onsite.

The Site is proposed to be redeveloped for a combination of one or more of residential, parkland, commercial, and community land uses. The configuration of the buildings associated with the proposed redevelopment is not known at this time.

1.8 Contaminants Exceeding Applicable Site Condition Standards in Soil

Soil environmental conditions were characterized based on evaluation of historical samples, and the recent investigations conducted for the Phase Two ESA. A total of 173 soil sampling locations and 349 soil samples were used to characterize the soil and identify COCs. A summary of the soil analytical results is provided in Table 6-5.

Soils on the Phase Two Property were found to be generally impacted with elevated concentrations of metals and petroleum hydrocarbons (PHCs). Localized soil impacts from polycyclic aromatic hydrocarbons (PAHs), benzene, toluene, ethylbenzene, and xylenes (BTEX), volatile organic compounds (VOCs), other regulated parameters (ORPs) and polychlorinated biphenyls (PCBs) were also identified in limited areas of the Phase Two Property. The presence of these parameters is consistent with the historical and industrial land use of the Site.

The analytical results of the investigation are summarized in Table 6-5 along with a comparison to the Table 6 SCS (MECP, 2011b). Figures 6-3 through 6-11 present the soil concentrations exceeding the Table 6 SCS by analytical group. Where there are exceedances of the Table 6 SCS, at least one cross-section presenting the inferred vertical extent of soil impacts by analytical group, has been prepared and follow the plan view figure. Maximum concentrations of each detected parameter have been provided in Table 6-6 and are shown in red text on the respective plan view and cross-sectional figures. COCs in soil have been identified in Table 6-7c.

The following subsections present a description of the soil conditions for each analytical group investigated.

1.8.1 Metals, Hydride-Forming Metals, Mercury and Hexavalent Chromium

Exceedances of the Table 6 SCS in soil for metals were widespread across the Site, and are consistent with the historical use of the Site as a foundry (APEC-1), with associated machine shop uses (APECs 2 and 10), annealing uses (APEC-3), and galvanizing activities (APECs 4 and 11). The main parameters exceeding the Table 6 SCS are lead and zinc. Maximum lead concentrations were greater than 5,000 µg/g, which occurred in a localized area surrounding BH07-65, near the western boundary of the Site. Exceedances of zinc were up to 67,200 µg/g occurring at MW17-108S, along with 6 other samples with concentrations greater than 10,000 µg/g. These locations were localized to areas on the southeastern corner of the Site, within or in the area of the former galvanizing building (APEC-5). Outside of these highly impacted areas, zinc was generally seen to increase in concentration with increasing depth, indicating that elevated zinc concentrations may also be attributable to naturally occurring zinc levels in the till or the bedrock below.

Other maximum concentrations of metals (including antimony, arsenic, cobalt, copper, mercury, and molybdenum) were mostly found in the surficial fill at various locations across the Site and are likely associated with the historical operations associated with the former foundry, as well as unknown fill quality (APEC-29). The northwestern portion of the Site showed the least impacts as known historical use was limited to an employee parking area. Other than this area, metals impacts extend to the property

boundaries, and are present in both the upper fill and deeper native silt overburden units, extending to the contact with the shallow bedrock surface.

The detected exceedances for metals, hydride-forming metals, mercury (Hg) and hexavalent chromium (CrVI) for soil, including their horizontal and vertical extents, are shown in plan view on Figure 6-3 (Part 1 and 2) and in cross-section view on Figures 6-3a through 6-3f.

1.8.2 Other Regulated Parameters (Hot Water Soluble-Boron, Cyanide, Electrical Conductivity, Sodium Adsorption Ratio)

Other regulated parameters (ORPs), including hot water soluble boron (HWS-Boron), cyanide, electrical conductivity (EC), and sodium adsorption ratio (SAR) were not detected at concentrations greater than the Table 6 SCS with the exception of EC. Three samples, from two locations, including one duplicate sample, exceeded the Table 6 SCS with a maximum concentration of 2.19 mS/cm at TP20-320. The impacted samples were collected from within the historical excavation area in the northeast portion of the Site. Borehole logs note the material as grey-brown sand and gravel. All other samples collected and analyzed for EC from the Phase Two Property met the Table 6 SCS. It is likely that the EC impacts are associated with the imported backfill materials used following the 1999 excavations.

The locations and exceedances for the ORPs in soil are shown in plan view and cross section on Figure 6-4 and 6-4a, respectively.

1.8.3 Benzene, Toluene, Ethylbenzene, Xylenes

Concentrations of BTEX (specifically, benzene, ethylbenzene, and xylenes) detected in soil greater than the Table 6 SCS were localized to two areas of the Site. The first location (BH07-66) is along the western boundary in the area of a former garage (APEC-20), with low level exceedances. A test pit (TP18-317) was excavated at this location (within 2 m) with a sample collected at the bedrock interface where concentrations of BTEX were not detected and met the SCS. The second location (TP13-11), also with low level exceedances, is in the south-central portion of the Site potentially associated with the former foundry (APEC-1) and/or unknown fill quality (APEC-29).

The detected BTEX exceedances in soil are shown in plan view on Figure 6-5 and in cross-section view on Figures 6-5a and 6-5b.

1.8.4 Petroleum Hydrocarbons

PHCs (specifically F2 to F4 fractions) in soil detected at concentrations greater than the Table 6 SCS were localized to three general areas: (1) a western portion, near the boundary of the Site at the area of the former garage (APEC-20) extending east to the general open areas of the Site which may have been "oiled" for dust control (APEC-29); (2) a central southern area of the Site, in the areas of the former oil house (APEC-7), transformers (APEC-16, APEC-22) and PCB capacitors (APEC-17); and (3) the northeastern and eastern portion of the Site surrounding the former 1999 excavation where a former machine shop (APEC-2, APEC-10), oil house (APEC-9), annealing room (APEC-3), galvanizing building (APEC-5), and plating operations (APEC-11) were located. PHC F1 concentrations met the Table 6 SCS.

The maximum concentrations for F2 of 3,600 µg/g at BH07-46 and for F3 of 23,000 µg/g at BH07-40 are both located in the northeastern portion of the Site, within and downgradient of the area historically remediated (for metals and PHC impacts). The maximum concentration for F4 was 7,300 µg/g at BH07-67, on the western portion of the Site, near the former garage (APEC-20).

Five samples from four locations analyzed for PHCs exhibited concentrations greater than the MECP Free Phase Threshold values (MECP, 2011b) for F2 (BH07-46), F3 (BH07-40, BH07-46, BH07-67, and MW17-108S), and F4 (BH07-67). PHC impacts were found in both the upper fill and deeper native silt

overburden units, including at the contact with the shallow bedrock surface, a depth at where the groundwater table is present on the east portion of the Site. Light nonaqueous phased liquids (LNAPL) has been found in wells in the area of BH07-40 and MW17-108S and are further discussed in Section 1.9.4.

The PHC exceedances detected in soil are shown in plan view on Figure 6-6 and in cross-section view on Figures 6-6a through 6-6e.

1.8.5 Polycyclic Aromatic Hydrocarbons

Concentrations of PAHs detected in soil greater than the Table 6 SCS were localized to four general areas: (1) at the western boundary of the Site, in the area of the former garage and coal storage (APECs 20 and 21); (2) in the south-central area of the Site where the former foundry (APEC-1), sand storage (APEC-4, APEC-15), coal storage (APEC-12), rail lines (APEC-13) were located; (3) along the northern boundary of the Site, west of the former excavation in areas formerly used for coal storage (APEC-18), paint shop (APEC-23), former rail line (APEC-13), and former drum storage (APEC-25); and (4) the eastern portion of the Site, south of the former excavation in areas where the former machine shop (APEC-2, APEC-10), UST (APEC-8) and coal storage (APEC-19) were located. PAH concentrations in all areas could also be attributable to the unknown fill quality (APEC-29).

Maximum PAH concentrations were located at OW07-34D, extending to a depth of 1.22 mbgs, located within the south-central area of the Site. Concentrations of PAHs at this location were consistently one or two orders of magnitude greater than other detected exceedances on the Phase Two Property. Borehole logs indicate that the material sampled at this location for PAHs was the upper fill materials. Deeper samples (that is, greater than 1.22 mbgs) collected just above the bedrock surface at nearby TP18-315 and MW17-102D also had concentrations of PAHs greater than the Table 6 SCS, however fewer analytes had exceedances and the reported concentrations were significantly lower than at OW07-34D. Vertically, the PAHs impacts were primarily located in the fill, with decreasing concentrations in the deeper native silt overburden unit.

The PAH exceedances detected in soil are shown in plan view on Figure 6-7 and in cross-section view on Figures 6-7a through 6-7c.

1.8.6 Volatile Organic Compounds

VOC concentrations detected in soil exceeding the Table 6 SCS, were limited to trichloroethylene (TCE), and occurred at 7 locations on the Site. The maximum TCE concentration of 35.4 µg/g was found at BH18-207i, a location likely within the footprint former galvanizing building, at a depth of 0.15 to 0.76 mbgs. Deeper samples collected at this location, showed concentrations reducing with depth, including a sample collected from just above the bedrock (2.9 mbgs) that met the Table 6 SCS.

The remaining 6 locations where detected TCE concentrations were greater than the Table 6 SCS of 0.061 µg/g, were found to be significantly lower, at concentrations of 1 µg /g or less. 5 locations were within the eastern corner of the Site, where the former galvanizing building (APEC-5) and machine shop (APEC-10) were located. The last location was MW17-102D, in the southwest area of the Site which had a TCE exceedance of 0.082 ug/g at a depth of 0.15 to 0.3 mbgs. MW17-102D was reinvestigated with two samples taken within 2 m of the original location, at the same depth of the previous exceedance, and both results met the Table 6 SCS. The combined average of the three samples (0.041 ug/g) confirmed that concentrations of TCE met the SCS (using averaging as per Section 48(2) of O. Reg. 153/04) for this location. The deeper sample collected at MW17-102D from 1.83 to 2.13 mbgs also met Table 6 SCS.

The results of the soil investigation for VOCs are shown in plan view on Figure 6-8 and in cross-section view on Figures 6-8a through 6-8c.

1.8.7 Chlorophenols

No detectable concentrations of CPs were reported at the Site, and reporting limits (RLs) met the Table 6 SCS. The assessment of CPs on Site was associated with the potential presence in spent foundry sand, which could be related with the former foundry (APEC-1), sand storage and mixing areas (APEC-4; APEC-15), and random areas of foundry operation waste fill across the Site of unknown quality (APEC-29).

As CPs did not have any detected concentrations at the Phase Two Property, they are not considered COCs for the Site. The locations investigated for CP in soil are shown in plan view on Figure 6-9.

1.8.8 Polychlorinated Biphenyls

Concentrations of PCBs in soil greater than the Table 6 SCS were localized to three general areas: (1) near the western boundary within APECs for a former garage (APEC-20) and unknown fill quality (APEC-29); (2) to the east within APECs for a former machine shop (APEC-2, APEC-10) and unknown fill quality (APEC-29); and (3) in the south-central area of the Site with APECs for former PCB capacitors (APEC-17) and unknown fill quality (APEC-29). The maximum PCB concentration of 1.65 µg/g occurred in the western area at the surface in TP17-300. An adjacent location, BH07-67 had a sample from 0.05 to 0.91 mbgs with a concentration of 1.5 µg/g for total PCBs. The maximum concentration at TP17-300 was vertically delineated by a deeper sample from 0.3 to 0.61 mbgs that meets the Table 6 SCS. The exceedance at BH07-67 was delineated by a deeper sample at 1.22 to 1.37 mbgs with concentrations of PCBs less than the SCS. Other areas of PCB contamination at SS-41 and TP17-306 in the south-central portion of the Site did not have deeper samples as they were collected right above the bedrock. Shallow PCB impacts at TP13-08 in the eastern area were vertically delineated by deeper samples collected from TP18-316 and BH07-52.

The results of the soil investigation for PCBs are shown in plan view on Figure 6-10 and in cross-section view on Figures 6-10a and 6-10b.

1.8.9 Acid, Base, and Neutral Compounds

No detectable concentrations of ABNs were reported at the Site from the current investigation and RLs met the Table 6 SCS. The assessment of ABNs on Site was associated with the potential presence of foundry sand, which could be related with the former foundry (APEC-1), sand storage and mixing areas (APEC-4; APEC-15), and random areas of foundry operation waste fill across the Site of unknown quality (APEC-29).

As ABNs did not have any detected concentrations at the Phase Two Property, they are not considered COCs for the Site. The locations investigated for ABNs in soil are shown in plan view on Figure 6-11.

1.8.10 Parameters without MECP Standards

Parameters without MECP Standards were screened against available Ontario Typical Ranges (OTR) calculated from the 98th percentile of the data distribution (OTR98) and coefficient of variation about the OTR98 (CV) values listed Region 2 from Table 8.2 (Soil - Old Urban Parks) in the "Rationale for the Development of Soil and Ground Water Standards for Use at Contaminated Sites in Ontario" (MECP 2011d). Soil analytical results were compared to OTR values, found in Table 6-5.

Based on the concentration of these parameters and COPCs from historical activities, four were identified as COCs on Site: bismuth, calcium, iron and magnesium. Calcium and magnesium concentrations above the OTR were found widespread across the Site. Maximum concentrations of these parameters (222,000 ug/g at TP20-320 for calcium and 120,000 ug/g at TP13-06 for magnesium) were associated with the fill within the historical excavation area in the northeast portion of the Site. In addition to historical activities, the shallow bedrock and natural soil conditions of the area likely play a factor in

elevated concentrations as increases with depth are seen in some areas outside of the general foundry. Iron is found sporadically across the property, with a maximum concentration in a historical surficial soil sample (128,000 ug/g at I). Bismuth (which has no MECP Standard or OTR value) was also found sporadically across the property with a maximum concentration in the south-central area of the foundry (concentrations of 36 ug/g and 150 ug/g from a parent and duplicate at TP13-11).

All four parameters are likely associated with the distribution of metals at the Site, which are present from the former foundry operations (APEC-1) as well as unknown fill quality (APEC-29). Impacts extend to the property boundaries and are present in both the upper fill and deeper native silt overburden units, extending to the contact with the shallow bedrock surface.

Detected concentrations of bismuth in soil and detected concentration exceeding the OTRs of calcium, iron and magnesium in soil, including their horizontal and vertical extents, are shown in plan view on Figure 6-12 and in cross-section view on Figures 6-12a through 6-12c.

1.9 Contaminants Exceeding Applicable Site Condition Standards in Groundwater

Groundwater quality across the Phase Two Property was evaluated through 448 groundwater samples collected from 94 groundwater monitoring wells screened in the overburden and bedrock contact zone, the Eramosa Formation, or the Goat Island Formation. A summary table of groundwater analytical results is provided in this attachment as Table 6-8.

Groundwater was generally found to be impacted with chlorinated VOCs (specifically, chloroethenes), with localized impacts of chloroethanes, BTEX, metals, PAHs, and PHCs.

The analytical results of the investigation are summarized on Table 6-8 along with a comparison to the Table 6 SCS (MECP, 2011). Figures 6-12 through 6-20 present the groundwater concentrations exceeding the Table 6 SCS by analytical group. Where there are exceedances of the Table 6 SCS, at least one cross-section presenting the inferred vertical extent of groundwater impacts by analytical group, has been prepared and follow the plan view figure. Maximum concentrations of each detected parameter have been provided in Table 6-9 and are shown in red text on the respective plan view and cross-sectional figures. COCs in groundwater are identified in Table 6-10d.

The following subsections present a description of the groundwater conditions for each analytical group investigated.

1.9.1 Metals, Hydride-Forming Metals, Mercury and Hexavalent Chromium

Concentrations of metals in groundwater greater than the Table 6 SCS were reported for arsenic, lead, and zinc. Isolated exceedances of antimony, arsenic, cobalt, and uranium occurred in single sampling events, but the results were not reproduced in subsequent sampling events. Therefore, these analytes (other than arsenic occurred elsewhere on the Site) were not considered groundwater COCs. The distribution of metals impacts in groundwater is smaller in area than the distribution of impacts in soil, but the impacts generally correspond geographically and are consistent with the wide-spread historical use of the Site as a foundry (APEC-1).

Arsenic exceedances in groundwater occurred at one location at the north-central area of the Site, just within for the area historically used for drum storage (APEC-25) and may be associated with this or the unknown fill quality (APEC-29). The impacts (arsenic reported up to 45.7 ug/L) are more likely to be associated with offsite sources such as PCAs to the north (APEC-30), as the soil conditions in this immediate area did not exhibit elevated arsenic (or other metal and hydride-forming metal) concentrations. Exceedances of the Table 6 SCS for arsenic occurred in the upper overburden and bedrock contact zone (MW18-112S, OW07-31) and Eramosa Formation (Reformatory Quarry Member) (MW18-

112D). Impacts at this location were vertically delineated by MW18-112G, which was installed deeper than OW07-31/MW18-112S/MW18-112D within the lower Vinemount Member of the Eramosa Formation.

Lead exceedances were localized to one location (OW09-II) in the eastern portion of the Site, with concentrations up to 17 ug/L over the Table 6 SCS of 10 ig/L. The area is associated with historical coal storage (APEC-19), a former UST (APEC-8), and unknown fill quality (APEC-29), and may see potential impacts from offsite PCAs to the south (APEC-31). OW09-II is screened within the Eramosa Formation (Reformatory Quarry) unit and the lead impacts were vertically delineated by OW09-I and MW18-129D, which are installed shallower (overburden and bedrock contact zone) and deeper within the same unit, respectively, at the same location.

Zinc exceedances were localized to the eastern portion of the Site and a single central location at the Site (OW07-32). The eastern impacts were found at 10 locations and are likely attributable to the former plating and galvanizing buildings (APECs 11 and 5) as well as associated operations including a former machine shop (APEC-10), unknown fill quality (APEC-29), and offsite PCAs to the east (APEC-31). Impacts of zinc were generally limited to the upper overburden and bedrock contact zone with the exception of three samples from one location (OW18-II) that is screened in the Eramosa Formation (Reformatory Quarry). Zinc exceedances in the central portion of the Site at OW07-32 (overburden and bedrock contact zone) are vertically delineated with MW18-116D, screened in the Eramosa Formation (Reformatory Quarry). In the eastern portion of the Site, several wells provide vertical delineation for the shallow groundwater impacts, including MW18-130D, MW18-132D, OW13-39D, OW22D, MW18-133D, MW18-129D, and OW31.

Concentrations of antimony (MW18-114D), arsenic (MW17-101D), cobalt (OW11-II), lead (OW07-33), uranium (OW22S), and zinc (OW36S) were greater than the Table 6 SCS in one sampling event but met the SCS in at least two subsequent sampling events at the same location. Therefore, these exceedances were considered anomalous and not representative of current Site conditions. These results are detailed in Table 6-10c and were not treated as exceedances for the purpose of the Phase Two ESA.

The groundwater metals results are shown in plan view on Figure 6-12 and in cross-section view on Figures 6-12a through 6-12d.

1.9.2 Other Regulated Parameters (Chloride, Sodium and Cyanide)

Inorganic parameters, including chloride, cyanide, sodium were not detected at concentrations greater than the Table 6 SCS. The locations of these ORP parameters investigated in groundwater are shown in plan view on Figure 6-13.

1.9.3 Benzene, Toluene, Ethylbenzene, and Xylenes

Concentrations of BTEX (specifically, benzene and ethylbenzene) in groundwater greater than the Table 6 SCS occurred in two areas of the Site: (1) the eastern third and (2) the south-central area along the southern boundary of the Phase Two Property. These areas had APECs related to a former foundry (APEC-1) and unknown fill quality (APEC-29) in the south-central area, and former machine shops (APEC-2, APEC-10), annealing room (APEC-3), former UST (APEC-8), oil house (APEC-9), plating (APEC-11), and offsite PCAs to the east (APEC-31) for the eastern third of the Site. The distribution of BTEX impacts in groundwater is larger in area than the distribution of impacts in soil and generally do not overlap. This pattern may indicate migration away from historical remediated soil sources (for example, in the northeast corner of the Site) with groundwater flow, the presence of offsite sources, or both.

Maximum detected concentrations for benzene and ethylbenzene both occurred at MW17-105S, in the upper overburden and bedrock contact unit in the eastern portion of the Site. MW17-105D, nested with

MW17-105S but screened within the Eramosa Formation (Reformatory Quarry/ Vinemount) unit also had exceedances of the Table 6 SCS for benzene, but had non-detected results for ethylbenzene. The benzene concentrations were an order-of-magnitude lower in the deeper unit compared the upper unit. Monitoring well MW18-105G was installed deeper than MW17-105D for vertical delineation, with no detected concentrations of BTEX reported. The BTEX impacts in the eastern area were vertically delineated by several monitoring wells including MW18-105G, MW18-128D, MW18-133D, and OW31.

In the south-central area of the Site, benzene exceedances were noted in MW17-102D at a screened depth of 13.76-15.29 mbgs. The APECs in this area (general foundry use [APEC-1} and unknown fill quality [APEC-29]) do not suggest that a point or diffuse source of BTEX was historically located in this area as there are no overlying BTEX impacts in soil identified. BTEX concentrations met the Table 6 SCS in nearby shallower upgradient monitoring wells (OW07-34S/D, MW18-125S, OW25, or MW18-126D), shallower cross-gradient monitoring wells (MW17-107S and OW26S/D), and deeper cross-gradient/ downgradient monitoring wells (MW18-107D, MW18-121D). Based on this evaluation, additional efforts to delineate the benzene impacts in MW17-102D were not deemed warranted due to the relatively low concentrations (1.44 µg/L compared to the maximum concentration onsite of 66.8 µg/L in the eastern portion of the Site), the depth of the impacts, and the lack of evidence linking these impacts to an onsite source.

Concentrations of benzene and ethylbenzene at OW22S were greater than the Table 6 SCS in one sampling event but met the SCS in two subsequent sampling events at the same location. Therefore, these exceedances were considered anomalous and not representative of current Site conditions. These results are detailed in Table 6-10c and were not treated as exceedances for the purpose of the Phase Two ESA.

The groundwater locations investigated for BTEX are shown in plan view on Figure 6-14 and in cross-section view on Figures 6-14a through 6-14d.

1.9.4 Petroleum Hydrocarbons

Concentrations of PHCs (PHC F1 to F4) in groundwater were greater than the Table 6 SCS in two areas of the Phase Two Property: (1) the eastern third of the Site with APECs for a former annealing room (APEC-3), machine shops (APEC-2, APEC-10), unknown fill quality (APEC-29), and offsite PCAs to the east (APEC-31), and (2) the south-central area of the Site with APECs for a former foundry (APEC-1), PCB capacitors (APEC-17), and unknown fill quality (APEC-29). The locations of PHC impacts in groundwater are geographically similar to two of the three areas where PHCs in soil were identified. This pattern suggests that the groundwater impacts are a result of onsite soil sources (with the exception of F1 PHCs which did not exceed the Table 6 SCS in soil), with some dispersion away from soil sources via groundwater flow. Maximum concentrations of F2, F3, and F4 occurred at OW22S, located near the northeastern corner of the Phase Two Property within the footprint of the area historically remediated (for metals and PHC impacts). The maximum concentration of PHC F1 occurred at OW24D, located in the southeast corner of the Site, potentially attributable to an offsite source to the east. PHC impacts in groundwater in the eastern portion of the Site were vertically delineated by several monitoring wells including OW22D, OW13-39D, MW17-104D, MW18-128D, MW18-135D, and OW31. LNAPL has been measured within OW23S, MW17-108S, and MW18-135S (all screened within the overburden and bedrock contact zone aquifer unit) on various occasions. The shallow PHC impacts in the south-central portion of the Site at OW25 were vertically delineated by MW18-126D.

The LNAPL has been observed over the years to have stayed within the property boundaries, and prior to advancing additional wells in the vicinity, has only been measured in the one well (OW23). The release of contaminants would have occurred sometime prior to the 1998 excavation, indicating that in over 20 years, potential migration has been limited. The removal of the LNAPL is considered infeasible due to its

presence being largely within the highly fractured bedrock, as remediation efforts would be inefficient, slow and costly.

The concentration of F2 PHCs at OW18-II was greater than the Table 6 SCS in one sampling event but met the SCS in two subsequent sampling events at the same location. Therefore, the exceedance was considered anomalous and not representative of current Site conditions. This result is detailed in Table 6-10c and was not treated as an exceedance for the purpose of the Phase Two ESA.

The PHC exceedances in groundwater, and locations of LNAPL are shown in plan view on Figure 6-15 and in cross-section view on Figures 6-15a through 6-15e.

1.9.5 Polycyclic Aromatic Hydrocarbons

Concentrations of PAHs in groundwater were greater than the Table 6 SCS were generally localized to one area of the Property: the eastern third with APECs for former annealing room (APEC-3), plating (APEC-11), machine shop (APEC-10), unknown fill quality (APEC-29), and offsite PCAs to the north (APEC-30). The distribution of PAHs impacts in groundwater is comparable in area to the distribution of impacts in soil, but the impacts do not overlap in all cases. The historical remedial activities in the northeast corner of the Site (for metals and PHCs) may have removed a soil source of PAHs, as PAHs are absent in soil in this area, but the largest region of PAHs impacts in groundwater are located within and adjacent to the excavation footprint.

The majority of detected exceedances and maximum concentrations for PAHs occurred at OW22S and OW23S, both screened in the upper overburden and bedrock contact. Both of these locations have nested deeper wells installed in the Eramosa Formation (Reformatory Quarry) unit that have samples meeting the SCS for the parameters that exceeded in the shallow aquifer unit (OW22D for OW22S and OW23D for OW23S). Additional vertical delineation in the eastern portion of the Site is provided by OW13-39D and MW18-135D.

Concentrations of PAHs in the centre and south-central areas of the Site at OW03-I and OW25 were greater than the Table 6 SCS in one sampling event, but met the SCS in at least two subsequent sampling events at the same location. Therefore, these exceedances were considered anomalous and not representative of current Site conditions. These results are detailed in Table 6-10c and were not treated as exceedances for the purpose of the Phase Two ESA.

The groundwater results for PAHs are shown in plan view on Figure 6-16 and in cross-section view on Figures 6-16a through 6-16d.

1.9.6 Volatile Organic Compounds

VOCs were found at concentrations greater than the Table 6 SCS across the entire Site. The distribution of VOC impacts in groundwater is larger in area than the distribution of VOC impacts in soil, indicating migration away from soil sources with groundwater flow. One area of soil VOC concentrations suggestive of an on-site chlorinated VOC source area was identified at BH18-207, however the decreasing concentrations in soil to Table 6 SCS at a depth above the groundwater table, and magnitude of concentrations present in groundwater suggests an alternate source or sources. Chlorinated VOC impacted groundwater may originate or be amplified by the presence of offsite sources (for example, offsite manufacturing activities [APEC-31, APEC-32, APEC-33]). While onsite APECs associated with historical VOC use have been identified, for example, the operation of a foundry (APEC-1), machine/electrical shops (APEC-2, APEC-10, APEC-27), galvanizing activities (APEC-5, APEC-11), most of the VOC impacts in groundwater in the Eramosa Formation or deeper are believed to originate from regional sources.

The following subsections discuss the distribution of chloroethenes (specifically, 1,1-dichloroethene; cis-1,2-dichloroethene [cis-1,2-DCE]; tetrachloroethene; trans-1,2-dichloroethene; trichloroethylene [TCE];

and vinyl chloride) and chloroethanes (1,1,1-trichloroethane and 1,1-dichloroethane) in groundwater. The results of the groundwater investigation for VOCs are shown in plan view on Figure 6-17 (Part 1 and 2) and in cross-section view on Figures 6-17a through 6-17e.

Chloroethenes

Chloroethenes in groundwater were found at various depths throughout the Site. The shallower impacts (in the upper overburden and bedrock contact zone) are generally located in the southwestern portion and eastern corner of the Site. Deeper impacts (Eramosa Formation [Reformatory Quarry/ Vinemount members]) extend across the entire Site, including the northwestern portion of the site where shallow groundwater impacts were not observed. Both wells screened in the Goat Island Formation (OW31 and MW18-136G) had low-level detections of cis-1,2-dichloroethene (1.88 µg/L to 3.14 µg/L compared to a SCS of 1.6 µg/L), with all other chloroethenes reported as nondetect. The maximum concentrations of the majority of the chloroethenes were found in OW24D, which is located in the extreme southeastern corner of the property, adjacent to an area of known increasing groundwater concentrations off Site, therefore implying a source area off Site in an easterly direction. Vertical delineation of impacts has been achieved for 1,1-dichloroethene and trans-1,2-dichloroethene (MW18-128D and OW31), TCE (MW17-103D, OW07-34D, MW18-123D, and OW31), and vinyl chloride (MW18-128D, MW18-133D, MW18-136D, MW18-105G, and OW31). Concentrations of these COCs are generally highest adjacent to the eastern property boundary (near OW13-39S/D and OW24D) and decrease with both depth and distance from this area. Vertical delineation was not achieved for cis-1,2-dichloroethene, as uniform concentrations were encountered in almost every monitoring well installed with screens between 10.28 and 25.32 mbgs. cis-1,2-Dichloroethene concentrations in 15 monitoring wells in this zone ranged from 1.23 to 5.36 µg/L (average of 2.4 µg/L), which is similar to the concentrations measured in OW31, screened from 28.9 to 33.32 mbgs in the Goat Island Formation. Further efforts to vertically delineate cis-1,2-DCE, deeper into the Goat Island formation were not considered warranted as:

- The concentration of cis-1,2-DCE in the deepest hydrostratigraphic unit, the Goat Island Formation, does not appear to be the result of chlorinated VOC impacts derived from the upper hydrostratigraphic unit. That is, where maximum chlorinated VOC parent compounds were identified, elevated concentrations of cis-1,2-DCE were not observed. This is evident in the area near OW31 where elevated concentrations of TCE were identified in the Stone Road and Reformatory Quarry Members of the Eramosa Formation. At this location TCE was not identified in the lower Goat Island Formation in OW31; however, approximately 2 µg/L of cis-1,2-DCE was identified;
- The concentration of cis-1,2-DCE at OW31 could be the result of downward migration in that area, however as previously noted, cis-1,2-DCE was identified from 1.23 to 5.36 µg/L in the lower hydrostratigraphic units (Vinemount Member and Goat Island Formation), across the area of the Site, including areas that are hydraulically up and cross-gradient of the shallow groundwater flow paths where elevated chlorinated VOCs in higher hydrostratigraphic units are observed. The concentration of cis-1,2-DCE at OW31 ranged from 1.88 to 2.01 µg/L (in the Goat Island Formation) was consistent with the concentration of cis-1,2-DCE, noted in other wells screened across the Goat Island and Vinemount Member across the site where concentrations ranged from 1.23 to 5.36 µg/L;
- The consistent concentration of cis-1,2-DCE identified in the Goat Island Formation and the Vinemount Member, a regional aquitard, implies that impact to the Goat Island Formation may be widespread, and is interpreted to be sourced from an area upgradient of the Site.
- It is also noted that the Site lies within the two-year travel time Wellhead Protection Area (WHPA-B) for several of the City of Guelph's municipal water supply wells. Phase Two activities included characterization of the COCs to a depth of approximately 25 to 30 mbgs, but characterization did not extend into the underlying municipal production aquifer (Gasport Formation) that is estimated to lie approximately 40 to 50 mbgs. As previously discussed, the Goat Island and Gasport Formation are

understood to be hydraulically connected to one another, with the Gasport Formation serving as the principal municipal aquifer. Water quality data in the City's Membro, Park, and Emma Wells were observed to have low concentrations of TCE and cis 1,2-DCE in 2017 (City of Guelph, 2018). The average detected concentrations of cis-1,2 DCE in the City's water supply in 2017 was 1.8 µg/L (0.00178 mg/L), similar to the observed concentrations on Site (City of Guelph, 2018).

These factors suggest there is a broad area of low concentration cis-1,2-DCE just greater than the Table 6 SCS beneath the Vinemount Member of the Eramosa Formation, a regional aquitard, including on Site. The data does not support the conclusion that chlorinated VOC impacts identified on Site are materially contributing to the observed elevated concentrations of cis-1,2-DCE.

This information also provides confidence that the concentration of cis-1,2-DCE identified in OW24D (in the northeastern corner of the Site, downgradient of the inferred offsite source area) represents the maximum concentration onsite. No significant VOC sources in soil were identified onsite and aside from the northeastern corner of the Site where the maximum was identified, concentrations of cis-1,2-DCE were observed to be consistently lower measuring between approximately 1 and 6 µg/L.

Chloroethanes

Chlorethanes were found at concentrations greater than the Table 6 SCS in 13 samples from 8 locations. These impacts appear to be localized to the southwestern area of the Phase Two Property, within areas formerly used as a foundry (APEC-1), electrical shop (APEC-27), and waste oil storage (APEC-28). Based on the distribution and groundwater flow direction, the impacts are likely from an on-Site source, though no concentrations of chloroethanes have been found in soil. The chloroethane impacts are primarily located in the upper overburden and bedrock contact zone in this area, with deeper impacts only observed in two monitoring wells (MW18-122D and OW07-34D) within the Eramosa Formation (Reformatory Quarry). Vertical delineation of chloroethane impacts are provided by the following monitoring wells which have concentrations of chloroethanes less than the Table 6 SCS: MW18-122G, MW18-120D, MW18-119D, MW18-116D, MW18-123D, MW18-126D, MW17-102D, and OW26D.

1.9.7 Chlorophenols

No detectable concentrations of CPs were reported from the wells analyzed and concentrations were also reported as non-detect in soil. The assessment of CPs on Site is associated with the potential presence in spent foundry sand, which could be associated with the former foundry (APEC-1), sand storage and mixing areas (APEC-4; APEC-15), and random areas of foundry operation waste fill across the Site of unknown quality (APEC-29).

As CPs did not have any detected concentrations at the Phase Two Property, they are not considered COCs for the Site. The locations investigated for CPs in groundwater are shown in plan view on Figure 6-18.

1.9.8 Polychlorinated Biphenyls

PCBs were reported with concentrations greater than the Table 6 SCS at one location, OW26S, in 2010. Subsequent sampling events in 2011 and 2017 at this location reported nondetect concentrations and RLs below the SCS of 0.20 µg/L. The exceedance is considered anomalous and not representative of Site conditions, and these results are detailed in Table 6-10c. All other samples for PCBs in groundwater on the Phase Two Property were nondetect with RLs which met the Table 6 SCS.

Previous remediation for PCBs occurred in the late 1990s for the former capacitor room (APEC-17) where concentrations of PCBs in soil less than 5 µg/g were left in place. These residual soil impacts do not appear to be having an impact on groundwater, based on nondetect results of PCBs in the monitoring wells immediately downgradient of this APEC.

As PCB concentrations were considered anomalous and were not reproduced in subsequent sampling events at the Phase Two Property, they are not considered COCs for the Site. The locations where groundwater was investigated for PCBs are shown in plan view on Figure 6-19.

1.9.9 Acid, Base, and Neutral Compounds

ABNs were not detected in concentrations greater than the Table 6 SCS at the Phase Two Property. The assessment of ABNs on Site was associated with the potential presence of foundry sand, which could be associated with the former foundry (APEC-1), sand storage and mixing areas (APEC-4; APEC-15), and random areas of foundry operation waste fill across the Site of unknown quality (APEC-29).

As ABNs did not have any detected concentrations at the Phase Two Property, they are not considered COCs for the Site. The locations investigated for ABNs in soil are shown in plan view on Figure 6-20.

1.10 Climatic or Meteorological Conditions Affecting Contaminant Distribution

Climatic or meteorological conditions that may have influenced the distribution and migration of COCs at the Phase Two Property include temporal fluctuations in groundwater levels. No atypical weather events that would be expected to influence COC transport are known to have occurred during the investigation of the Phase Two Property.

1.11 Soil Vapour Intrusion

Vapour intrusion was not evaluated as part of the Phase Two ESA because there are currently no existing buildings on the Phase Two Property. Details regarding the location or construction details of future buildings, or where subsurface utilities will be installed are not known at this time. Based on the results of the Phase Two ESA, volatile COCs are present in soil and groundwater at concentrations greater than the Table 6 SCS. Therefore, an assessment of the potential for vapour intrusion into future buildings should be further investigated as part of a Risk Assessment for the Phase Two Property or when detailed redevelopment plans become available.

1.12 Contaminant Pathways and Receptors

Figures 6-21 to 6-24 present the human health and ecological contaminant pathway and receptor models, respectively, based on current and potential future Site conditions. The Site could be redeveloped for a mix of one or more of residential, commercial, parkland or community land use in the future. The models present preliminary assessments of the exposure pathways that should be further investigated, should a Risk Assessment be conducted for the Phase Two Property.

These figures identify the following:

1. **Release mechanisms** – The Phase Two Property became impacted as a result of historical operations at the Site (refer to the discussion on PCAs and APECs) where COCs were released to the ground (for example, via a spill or leak) or where impacted soil was imported to the Site and placed as fill.
2. **Contaminant transport pathways** – COCs released to soil may adsorb to soil or infiltrate deeper into the soil column. COCs in soil may also desorb and leach to groundwater or migrate vertically to the water table. COCs in soil can also be transported in the following ways: they can become airborne via wind or traffic erosion, eroded by overland water flow, be taken up by vegetation planted in the soil, or volatilize to outdoor air or indoor enclosed spaces. COCs in groundwater can be transported via vertical or horizontal groundwater flow, volatilization to outdoor air or indoor enclosed spaces, and uptake by vegetation.

3. **Human and ecological receptors located on, in, or under the Phase Two Property** – Receptors currently present or expected to be present in the future at the Phase Two Property include:
   - Human Receptors – residents, visitors, indoor workers, outdoor workers, construction workers, and utility workers.
   - Ecological Receptors - soil organisms, terrestrial plants, birds, and mammals
4. **Receptor exposure points** – COCs can be contacted directly in soil or groundwater and indirectly in outdoor and indoor air.
5. **Routes of exposure** – The primary routes of exposure by receptor type include:
   - Human Receptors
     - Direct contact with either soil or groundwater (incidental ingestion and dermal contact)
     - Inhalation of particulates (dust)
     - Inhalation of volatiles originating from a soil or groundwater source (indoor and outdoor air)
     - Ingestion of garden produce
   - Ecological Receptors
     - Direct contact with either soil or groundwater (ingestion and dermal)
     - Terrestrial plant root uptake from either soil or groundwater
     - Ingestion via terrestrial biota and prey

1.13 Non-Standard Delineation

Under the assumption that the Risk Assessment (RA) will be accepted by the MECP, non-standard delineation per O. Reg. 153/04 Schedule E, Section 7.1 was conducted for the following COCs:

- cis-1,2-dichloroethylene (cis-1,2-DCE) in groundwater at OW31 (refer to Figures 6-17, 6-17c and 6-17d).

Delineation was conducted to the requirements of O. Reg. 153/04 Schedule E, Section 7 for all other COCs identified at the RA Property in soil and groundwater.

There is confidence that the maximum concentration of cis-1,2-DCE onsite has been located (OW24D) given its proximity to the known offsite source of chloroethenes and the consistently lower concentrations found across the remainder of the Site, decreasing both horizontally and vertically. Low levels of cis-1,2-DCE are present at depths on Site greater than the depth of OW24D, however the low level cis-1,2-DCE is present across the entire Site in the Goat Island Formation and the Vinemount Member, interpreted to be from an upgradient offsite source based on regional data. Additional vertical or lateral delineation of cis-1,2-DCE at the Site would not materially change Phase Two ESA Conceptual Site Model (CSM), or the Risk Management measures (RMM) to be developed as part of the RA based on the existing dataset. We understand that the MECP concurs with this interpretation, as well as agrees on the importance to avoid drilling deeper into the City's municipal drinking water aquifer, the Gasport Formation. Based on this information, the QP is satisfied that the current dataset provides adequate information to support the RA and additional vertical delineation is not required.

Tables

Table 2-3. Items Considered for Site Condition Standards Selection

Phase Two Environmental Site Assessment, 200 Beverly Street, Guelph, ON

Condition	Evaluation
Land use	The current land use is industrial, and the proposed future land use may include residential/parkland and commercial uses, provided an RSC acknowledged by the MECP is obtained.
Potable or nonpotable groundwater	The Site and adjacent properties within 100 m are serviced by a municipal water source. Because the groundwater near the Property does and will serve as a raw water supply for a drinking water system, the potable groundwater condition applies.
Proximity to surface water body	The Site is not located within 30 m of a water body.
Proximity to areas of natural significance or environmentally sensitive areas	The Site is not considered to be within proximity of an environmentally sensitive area based on the information reviewed as part of the Phase One ESA (CH2M HILL 2017).
Depth to bedrock	A property is considered a shallow soil property if one-third or more of the area consists of soil depths of 2 mbgs or less, excluding nonsoil surface treatment (that is, asphalt, concrete, or aggregate) (MOE 2011a).The depth to bedrock is considered to be less than 2 m, because shallow soil was observed on one-third or more of the Phase Two Property.
pH of soil	Based on the results of the Jacobs investigations, soil pH was found to range from 6.6 to 9.0, with the exception of two samples. Samples collected at BH17-204 and MW17-100S were measured with a pH value outside of MECP's acceptable upper limit of 9.0 for surface soils. A review of the borehole logs from these locations indicated that concrete rubble or dust was likely present in the submitted samples, which had pH values of 9.45 and 10.64. The other pH values collected during the CH2M investigation were within the MECP's acceptable range. The soil from BH17-204 was determined to be "isolated fill," because concrete foundations were encountered both above and below the soil layer, isolating it from the overburden soils at the Site. An additional sample was collected at MW17-100S, which reported a pH value of 7.71. Using the average of the two samples as outlined in Section 48 of O. Reg. 153/04, it was confirmed that pH concentrations were within the acceptable range.
Soil texture	For this evaluation, because of the extensive presence of heterogeneous fill materials across the Site, the standards for coarse-grained soils were used to be conservative.

Notes:

ESA = Environmental Site Assessment

m = metre(s)

mbgs = metre(s) below ground surface

MECP = Ministry of Environment, Conservation and Parks

O. Reg. = Ontario Regulation

RSC = record of site condition

APEC-1	Foundry – A foundry was operated on the site by IMICO from 1913 to 1989, when the plant closed and was abandoned. The foundry operated as an iron-jobbing facility for the production of various metallic forms, using malleable and ductile iron (DCS 2014). Foundry sands were predominantly located in the concrete pits and sumps of the main foundry building. Foundry sands, sludge materials, and process waste were removed from the site, and buildings were demolished in 1999 (Earth Tech 1999). The P&R investigation also reported that moulding sands and dust collector waste was stored at the northwestern corner of the building and drained to the truck bay (P&R 1991).	32	Iron and Steel Manufacturing and Processing	ABNs, BTEX, CPs, PAHs, PHCs, VOCs, Metals	7	TP	PAHs, Metals*, CN-, CrVI, Hg, EC, pH	--

APEC-2	Machine Shop – A machine shop was shown on the 1916 FIP, east of the original foundry. The northern one-third of the machine shop was identified for "Tumbling and Cleaning" operations, inferred to be in association with the adjacent "Annealing Room" to the north. FIPs prepared in 1929, 1945, and 1960 showed this area changed operations to "Shipping" and a "Pattern Shop."	34	Metal Fabrication	BTEX, PAHs, PHCs, VOCs, Metals	BH07-47	BH	BTEX, PAHs, PCBs, PHCs, VOCs, Metals*, HF Metals	--

Phase Two Environmental Site Assessment, 200 Beverley Street, Guelph, Ontario

Areas of Potential Environmental Concern (APEC)		PCA [a.]		COPCs (based on AP method groups [b,c])	Location Associated with APEC Area	Location Type	List of Parameter Groups Tested (soil) [b.]	List of Parameter Groups Tested (GW) [b.]
APEC-3	Annealing – An "Annealing Room" with four furnaces is shown on the 1916 FIP. A brick chimney is located on the northern wall. The 1929 FIP shows nine furnaces, with the Annealing Room extended westward with an additional chimney on the northern wall within the extended area; the southern portion of the Annealing Room is identified as the "Tumbling Dep't." The 1946 FIP shows a structural addition on the eastern side of the Annealing Room, with two additional furnaces. The 1960 FIP shows further eastward expansion and the addition of a third furnace. Tumbling Dep't operations appear consistent in location and footprint, from 1929 through to 1960. The furnaces are inferred to be coal fired from 1916 through to 1960, based on the nearby coal storage areas shown on the 1946 and 1960 FIPs, and the absence of ASTs or USTs for fuel oil storage on the FIPs. The furnace fuel from after 1960 to the end of operations in 1989 is not known, but a period of fuel-oil-fired operation of the furnaces is suspected; see APEC 7. No information was identified to suggest coal or fuel oil storage within the Annealing Room; however, no information regarding temporary furnace fuel storage, transmission, or waste disposal was identified. Dust control equipment is shown on Figure 4 of the 1991 P&R report, on the northern side of the Annealing Room.	32	Iron and Steel Manufacturing and Processing	BTEX, PAHs, PHCs, VOCs, Metals	BH07-46	BH	BTEX, PAHs, PCBs, PHCs, VOCs, Metals*, HF Metals	--

					TP20-321	TP	BTEX, PAHs, PHCs, VOCs, THMs, Metals, HF Metals, B-HWS, CN-, CrVI, Hg, EC, SAR	--
APEC-4	Sand Storage – The 1916 FIP shows a "Sand Shed." The 1929 and 1946 FIPs again show the Sand Shed, plus a second smaller building to the west labelled "Sand." The 1960 FIP shows the original "Sand Shed" as "Bricks" and the second smaller building to the west labelled as "Sand & Bricks," and an additional area to the north labelled "Sand." No information was identified as to whether only clean process, spent foundry sands, or both were stored in these buildings; therefore, the potential storage of spent foundry sand in these buildings is considered. The purpose and types of bricks stored was not identified. The potential for new and used refractory brick and associated process materials is considered possible.	32	Iron and Steel Manufacturing and Processing	ABNs, CPs, PAHs, Metals	BH07-58	BH	BTEX, PAHs, PCBs, PHCs, VOCs, Metals*, HF Metals	--

APEC-5	Galvanizing Building – A small free-standing building for "Galvanizing" was present on the southeastern portion of the Site as shown on the 1916, 1929, and 1946 FIPs. The Galvanizing building was not shown on the 1960 FIP, with the area occupied by a larger new structure identified as "Fittings Whse" (warehouse). No information was identified regarding process chemical use and storage, or waste management practices in association with the galvanizing operations conducted.	33	Metal Treatment, Coating, Plating, and Finishing	BTEX, PAHs, PHCs, VOCs, Metals	BH18-207	BH	PHCs, Metals, HF Metals	--

					TP18-310	TP	PHCs, Metals, HF Metals	--
APEC-6	Chipping/Grinding Room – A "Chipping Room" was shown on the FIPs prepared in 1929, 1946, and 1960, located west of the Annealing area. The 1916 FIP shows this as exterior yard area west of the "Annealing Rm," with a small outbuilding that appears to be connected to the Annealing Room with a linear underground feature. The 1991 P&R report identified this as a "Trimming and Grinding" area; this information is inferred to be based on the interview of historical IMICO employees. "Dust control equipment" is shown on Figure 4 of the 1991 P&R report, on the exterior western side of the building.	34	Metal Fabrication	Metals	BH18-208	BH	PAHs, Metals, HF Metals	--

Table 6-4. APEC Disposition Table

Phase Two Environmental Site Assessment, 200 Beverley Street, Guelph, Ontario

Areas of Potential Environmental Concern (APEC)		PCA [a.]		COPCs (based on AP method groups [b,c])	Location Associated with APEC Area	Location Type	List of Parameter Groups Tested (soil) [b.]	List of Parameter Groups Tested (GW) [b.]
APEC-7	Oil Houses, Boiler House and ASTs – A building is shown on the 1929 FIP to the north of the Foundry and east of the power house that is labelled "Oil," and an additional building with the same label is shown to the north of this original building on the 1946 FIP. The 1960 FIP shows the northern building remaining, but it is not labelled as an oil house. The 1916 FIP shows this as empty exterior yard area north of the foundry. The P&R Investigation figures show a boiler house to the east of the power house and two 45,000-L (10,000 gallon) oil tanks to the east of the building with "no history of leaks or spills" (P&R 1991). One 45,000-L AST was reported removed in 1998 during demolition activities and had been used to store Bunker C fuel. The AST removed had been located east of the Core Room (Earth Tech 1999).	28	Gasoline and Associated Products Storage in Fixed Tanks	BTEX, PHCs	BH07-56	BH	BTEX, PAHs, PCBs, PHCs, VOCs, Metals*, HF Metals	--
					JS15	TP	PAHs, PCBs, Metals*, CN-, CrVI, Hg	--
					MW17-103D	MW	ABNs, BTEX, CPs, PAHs, PHCs, VOCs, THMs, Metals, HF Metals, B-HWS, CN-, CrVI, Hg, EC, SAR, pH	BTEX, VOCs, THMs

					TP13-04	TP	BTEX, PAHs, PCBs, PHCs, VOCs, THMs, Metals, HF Metals, Hg	--
APEC-8	Gasoline UST – As indicated on the 1960 FIP, a gasoline UST is shown north of a small office building, and west of "scales" at the corner of Kingsmill Avenue and Beverley Street. The area is empty exterior yard area on the 1916 FIP, and the 1929 and 1946 FIPs show the office (labelled as a "time office"), but it does not show the UST. The gasoline use is not known; however, it is inferred to be for fueling gasoline-powered equipment/vehicles used at the plant. The 1991 Proctor & Redfern investigation reported that an IMICO employee indicated the UST was removed in the mid-1980s in response to a request from the City due to gasoline vapours in the sewers along Beverley and York Streets. No significant contamination was reported (P&R 1991).	28	Gasoline and Associated Products Storage in Fixed Tanks	BTEX, PAHs, PHCs, VOCs, Metals	B	TP	Metals*, CrVI, EC, pH	--

					MW18-105G	MW	--	BTEX, VOCs, THMs
APEC-10	Machine Shop – A machine shop is shown on the 1929, 1946, and 1960 FIP, east of the original foundry building. The floor is indicated as concrete. Machine shop cuttings were stored on the ground north of the building, and two small ceiling-mounted oil tanks were present in the building as noted in the P&R investigation (1991). The area is shown on the 1916 FIP as exterior yard area, with a small unidentified building in the central area of the future machine shop. The northern portion of the machine shop was removed during the 1999 excavation based on the excavation footprint (EarthTech 1999).	34	Metal Fabrication	BTEX, PAHs, PHCs, VOCs, Metals	BH07-40	BH	BTEX, PAHs, PCBs, PHCs, VOCs, Metals*, HF Metals, CN-, CrVI, Hg, EC, SAR, pH	--

Table 6-4. APEC Disposition Table

Phase Two Environmental Site Assessment, 200 Beverley Street, Guelph, Ontario

Areas of Potential Environmental Concern (APEC)		PCA [a.]		COPCs (based on AP method groups [b,c])	Location Associated with APEC Area	Location Type	List of Parameter Groups Tested (soil) [b.]	List of Parameter Groups Tested (GW) [b.]
APEC-11	Plating/Galvanizing Building – A galvanizing building was present on the Site as shown on the 1946 and 1960 FIP. The previous FIPs (1916 and 1929) show this as exterior yard area. On subsequent site plans (P&R 1991; Earth Tech 1999), the building was identified as a storage shed and was reported as having been used for dip galvanizing before 1975, with rinse water discharged into "dry wells" north of the building (P&R 1991). Investigations by P&R and Gartner Lee indicated high concentrations of zinc, other metals, and oil & grease. Free product was observed wells (OW01-I, OW20, OW21). The area was excavated to bedrock (ranging from 1.3 to 2.0 mbgs and approximately 9,400 tonnes of contaminated soil and 925 tonnes of contaminated concrete were removed. Soil samples were collected from the final limits of the excavation walls and indicated most locations having zinc and TPH concentrations above the Table A Guidelines. The excavation was backfilled with granular "B" materials. A single sample was collected from the backfill and met the guidelines applicable at the time of the report (Earth Tech, 1999). A well nest (OW22S/D) was installed within the excavation area (the report for this installation was not available, and therefore, the soil conditions are unknown if analyzed as part of the investigation). Test pits and boreholes installed in the area in 2013 by DCS indicated soils having high zinc and other metal concentrations. Groundwater conditions at OW22S reported free product, which was highly weathered with a slight oil/diesel odour (as reported in the summary of the Gartner Lee 2000/2001 investigation in DCS 2007a). Borehole logs for OW22S/D indicate the presence of fuel/diesel type odour in the fill which extends to approximately 1.5 mbgs; and hydrocarbon odour extending into the underlying bedrock with black staining on fractures. Groundwater sampled from OW22S has not since reported free product but has had concentrations of PHCs increasing since the annual monitoring at this location began in 2016, up to 850,000 ug/L of F3. Zinc concentrations have widely fluctuated over the years and have exceeded in approximately 25 percent of the sampling events between 2005 and 2016.	33	Metal Treatment, Coating, Plating, and Finishing	BTEX, PAHs, PHCs, VOCs, Metals	BH07-42	BH	BTEX, PCBs, PHCs, VOCs, Metals*, HF Metals, CN-, CrVI, Hg, EC, SAR, pH	--

APEC-13	Rail Line – A former rail line was shown onsite north of the buildings on the 1916, 1929, and 1946 FIPs, running east to west for the full length of the foundry building. On the 1960 FIP, the western portion was shown to have been removed to accommodate the newly constructed shipping/stock room; the rail siding ended at the eastern side of the building. It is inferred that raw materials and finished products were shipped by rail.	46	Rail Yards, Tracks, and Spurs	PAHs, Metals	11	TP	Metals*, CrVI, Hg, EC, pH	--

					OW10	MW	--	BTEX, PAHs, PHCs, VOCs, THMs, Metals, HF Metals, Na, Cl, CN-, CrVI, Hg
APEC-15	Sand Mixing/Storage – Sand mixing is shown in a building north of the foundry as shown on the 1960 FIP. Previous FIPs (1916, 1929, 1946) show this as exterior yard area, north of the foundry. Subsequent site plans (P&R 1991; GLL 1999; Earth Tech 1999) do not have an indication of the buildings use.	8	Chemical Manufacturing, Processing, and Bulk Storage	ABNs, CPs, PAHs, PHCs, Metals	BH17-200	BH	ABNs, BTEX, CPs, PAHs, PHCs, VOCs, THMs, Metals, HF Metals, B-HWS, CN-, CrVI, Hg, EC, SAR, pH	--

APEC-16	Transformers – Transformers are first shown on the 1960 FIP, north of the powerhouse. Previous FIPS (1916, 1929, 1946) show this as exterior yard area north of the power house. Transformers of this era may have contained PCBs.	55	Transformer Manufacturing, Processing and Use	PCBs, PHCs	OW07-32	MW	BTEX, PAHs, PCBs, PHCs, VOCs, Metals*, HF Metals, CN-, CrVI, Hg, EC, SAR, pH	BTEX, PAHs, PCBs, PHCs, VOCs, THMs, Metals, HF Metals, Na, Cl, CN-, CrVI, Hg
					TP13-03	TP	BTEX, PAHs, PCBs, PHCs, VOCs, THMs, Metals, HF Metals, Hg	--
APEC-17	Capacitor Room – PCB-containing capacitors were present in the centre of the foundry, as first shown on the P&R investigation site plan, and later remediated as part of the Earth Tech demolition (P&R 1991; EarthTech 1999). Activities included removal of a concrete floor, a utility trench located in the eastern section (concrete walls, granular base) that was heavily stained, a subfloor that was present in the central section, and a sump located in on the eastern portion of the capacitor room that were each indicated as PCB-impacted and excavated and disposed offsite. The area was excavated to bedrock (1.0 – 1.3 mbgs) to remove concentrations above 5 µg/g. Final samples (composite soil, soil, concrete, and bedrock) from the limits of excavation in the capacitor room reported PCB concentrations under 5 µg/g, with the exception of two bedrock samples within the eastern sump area that had concentrations around 10 µg/g. A well (OW25) was installed within the excavation area (the report for this installation was not available, and therefore, the soil conditions are unknown if analyzed as part of the investigation), and subsequent groundwater monitoring of the area has indicated concentrations of chlorinated VOCs and PHCs (mainly F3) above the applicable potable water criteria (Table 6 Standards) (DCS 2007b, 2014b; AECOM 2017a and 2017b).	55	Transformer Manufacturing, Processing, and Use	PCBs, PHCs	C11	CH	PCBs, Metals*	--

APEC-22	Transformer – A 1200-volt transformer is shown on the 1991 Site Plan (P&R 1991).	55	Transformer Manufacturing, Processing, and Use	PCBs, PHCs	BH17-201	BH	PAHs, PCBs, PHCs, Metals, HF Metals, B-HWS, CN-, CrVI, Hg, EC, SAR, pH	--
					OW07-33	MW	BTEX, PCBs, PHCs, VOCs, Metals*, HF Metals, CN-, CrVI, Hg, EC, SAR, pH	ABNs, BTEX, CPs, PAHs, PCBs, PHCs, VOCs, THMs, 1,4-dioxane, Metals, HF Metals, Na, Cl, CN-, CrVI, Hg
APEC-23	Paint Shop – First shown on the P&R Site plan, a paint shop was located at the northern end of the site between the shipping building and the storage area (P&R 1991). Drums were stored against the northern wall for materials used in the paint shop. The FIPs show this area as exterior yard area in the early FIPs (1916, 1929, 1946) and empty space between existing buildings in the 1960 FIP.	39	Paints Manufacturing, Processing, and Bulk Storage	BTEX, PAHs, PHCs, VOCs, Metals	12SE10	TP	Metals*, HF Metals, CrVI, Hg	--
					BH20-214	BH	BTEX, PAHs, PHCs, VOCs, THMs, Metals, HF Metals, B-HWS, CN-, CrVI, Hg, EC, SAR	--
					C14	CH	Metals*	--
					MW17-110S	MW	ABNs, BTEX, CPs, PAHs, PHCs, VOCs, THMs, Metals, HF Metals, B-HWS, CN-, CrVI, Hg, EC, SAR, pH	BTEX, PAHs, PHCs, VOCs, THMs, Metals, HF Metals, Na, Cl, CN-, CrVI, Hg
					OW07-38S	MW	BTEX, PHCs, VOCs, Metals*, HF Metals	BTEX, PAHs, PCBs, PHCs, VOCs, THMs, Metals, HF Metals, Na, Cl, CN-, CrVI, Hg
APEC-24	PCB Storage Area – An area located at the northeastern corner of the finishing and annealing room with a concrete pad was identified in the Earth Tech investigation as a former PCB storage area. Concentrations above 50 ppm of PCBs were identified. Previous site maps showed this area as "storage" (P&R 1991) or part of the Annealing Room (1946 and 1960 FIPs). During the demolition activities, approximately 250 kg of PCB-containing ash residue from the top of the concrete pad and the concrete pad itself was removed and taken for offsite disposal (Earth Tech 1999). Confirmatory samples below the pad were 0.63 and <0.05 µg/g. The soil was later excavated to bedrock as part of the soil remediation in the northeastern corner of the property (see APEC-11).	55	Transformer Manufacturing, Processing, and Use	PCBs, PHCs	BH07-46	BH	BTEX, PAHs, PCBs, PHCs, VOCs, Metals*, HF Metals	--
					ES-11	CS	PAHs	--
					ES-12	CS	PAHs	--

Areas of Potential Environmental Concern (APEC)		PCA [a.]		COPCs (based on AP method groups [b,c])	Location Associated with APEC Area	Location Type	List of Parameter Groups Tested (soil) [b.]	List of Parameter Groups Tested (GW) [b.]
APEC-25	Drum Storage – Interviews with former employees as part of the P&R investigation identified drum storage activities that occurred along the northern property boundary (P&R 1991). No additional information was provided on the nature of what was stored and whether there was any associated contamination as a result of the materials.	8	Chemical Manufacturing, Processing, and Bulk Storage	BTEX, PAHs, PHCs, VOCs, Metals	10	TP	Metals*, CrVI, Hg, EC, pH	--

					TP18-319	TP	PAHs, Metals, HF Metals	--
					TP20-322	TP	BTEX, PAHs, PHCs, VOCs, THMs, Metals, HF Metals, B-HWS, CN-, CrVI, Hg, EC, SAR	--
APEC-26	Former Substation – A former substation is indicated on the P&R (1991) and Earth Tech (1999) site plans. A sample of transformer oil from the former substation analyzed in the Earth Tech report indicated nondetect concentrations of PCBs. Similarly, one location installed during the DCS Phase II ESA (2007) indicated nondetect PCB concentration. Previous site plans (FIPs) show this area as exterior yard areas.	55	Transformer Manufacturing, Processing, and Use	PCBs, PHCs	BH07-65	BH	BTEX, PAHs, PCBs, PHCs, VOCs, Metals*, HF Metals	--
					MW17-111S	MW	BTEX, PCBs, PHCs, VOCs, THMs, Metals, HF Metals, B-HWS, CN-, CrVI, Hg, EC, SAR, pH	BTEX, PCBs, PHCs, VOCs, THMs, Metals, HF Metals, Na, Cl, CN-, CrVI, Hg

					TP18-312	TP	Metals, HF Metals	--
					TP18-313	TP	Metals, HF Metals	--
					TP18-314	TP	Metals, HF Metals	--
APEC-27	Former Electrical Shop – A small electrical shop was noted to be on the southwestern corner of the foundry (P&R 1991). This addition was not shown on the FIPs from previous years and was shown as the exterior yard area west of the foundry.	34	Metal Fabrication	BTEX, PAHs, PHCs, VOCs, Metals	6	TP	Metals*, CrVI, Hg, EC, pH	--
					DSW7	TP	Metals*, CN-	--
					MW18-120D	MW	Metals, HF Metals	BTEX, VOCs, THMs, Metals, HF Metals, Na
					OW12	MW	--	BTEX, PAHs, PHCs, VOCs, THMs, 1,4-dioxane, Metals, HF Metals, Na, Cl, CN-, CrVI, Hg
					TP17-303	TP	BTEX, PAHs, PHCs, VOCs, THMs, Metals, HF Metals, B-HWS, CN-, CrVI, Hg, EC, SAR, pH	--
					TP20-324	TP	BTEX, PAHs, PHCs, VOCs, THMs, Metals, HF Metals, B-HWS, CN-, CrVI, Hg, EC, SAR	--
APEC-28	Waste Oil Storage – Used oil was stored above ground on the southwestern end of the foundry as shown on the P&R Site Plan (P&R 1991).	28	Gasoline and Associated Products Storage in Fixed Tanks	BTEX, PAHs, PHCs, VOCs, Metals	6	TP	Metals*, CrVI, Hg, EC, pH	--
					MW18-120D	MW	Metals, HF Metals	BTEX, VOCs, THMs, Metals, HF Metals, Na
					OW12	MW	--	BTEX, PAHs, PHCs, VOCs, THMs, 1,4-dioxane, Metals, HF Metals, Na, Cl, CN-, CrVI, Hg
					TP17-303	TP	BTEX, PAHs, PHCs, VOCs, THMs, Metals, HF Metals, B-HWS, CN-, CrVI, Hg, EC, SAR, pH	--
APEC-29	Fill of Unknown Quality – The areas of the Site have a layer of fill above the native silty sands. Previous investigations have indicated a layer of fill consisting of foundry sands, slag, and cinders (up to 1.0 m) was found across the site (P&R 1991) and the fill to be mix of foundry operation waste such as "coal, clinker, ash, metals, and detritus from the former foundry operations" and reworked native from "reworking onsite soils as a result of initial construction and subsequent expansion activities" (DCS 2007b). The yard areas were additionally noted to have been oiled (presumably engine oil) (P&R 1991).	30	Importation of Fill Material of Unknown Quality	ABNs, BTEX, CPs, PAHs, PCBs, PHCs, Metals	1	TP	Metals*, CrVI, Hg, EC, pH	--

Table 6-4. APEC Disposition Table

Phase Two Environmental Site Assessment, 200 Beverley Street, Guelph, Ontario

Areas of Potential Environmental Concern (APEC)		PCA [a.]		COPCs (based on AP method groups [b,c])	Location Associated with APEC Area	Location Type	List of Parameter Groups Tested (soil) [b.]	List of Parameter Groups Tested (GW) [b.]
APECs from Offsite PCAs to the North								
APEC-30 (Offsite North)	Rail Lines – Bordering the northern side of the Site, rail lines are present (owned by Guelph Rail Line) and have existed since at least the early 1900s. Has historically been indicated as the Canadian Pacific Railway (1916, 1929, 1946, 1960 FIPs and P&R [1991]), Guelph Junction Railway (EarthTech 1999; DCS 2007a).	46	Rail Yards, Tracks, and Spurs	ABNs, BTEX, CPs, PAHs, PHCs, VOCs, Metals	10	TP	Metals*, CrVI, Hg, EC, pH	--
					12	TP	PCBs, Metals*, CrVI, Hg	--
	Paper Manufacturing – Companies at 309 Elizabeth Street have been listed in the Scott's Manufacturing Directory for paper-related manufacturing: Trinity Graphics was established in 1977 and 1978 with plant sizes of 3,000 and 50,000 m^3 for paper bag and coated and treated paper manufacturing, other converted paper product manufacturing, platemaking and related services; Independent Paper Converters was established in 1978 with a plant size of 56,000 m^3 for manufacturing, including paper bag, coated and treated paper, plastic film and sheet. The 1960 FIP indicated gummed paper manufacturing (Top Paper Products).	45	Pulp, Paper, and Paperboard Manufacturing and Processing		12SE10	TP	Metals*, HF Metals, CrVI, Hg	--
					BH07-42	BH	BTEX, PCBs, PHCs, VOCs, Metals*, HF Metals, CN-, CrVI, Hg, EC, SAR, pH	--
					BH07-45	BH	BTEX, PAHs, PCBs, PHCs, VOCs, Metals*, HF Metals	--
					BH07-51	BH	BTEX, PAHs, PCBs, PHCs, VOCs, Metals*, HF Metals	--
					C7	CH	Metals*	--
	Auto Body Repair Shop – An automobile wrecking and recycling record was listed in the ERIS report for Sutton Auto Collision at 349 Elizabeth Street, which is an autobody repair facility. Additionally Top Gun Auto Painting & Collision is listed at this address from the City Directory.	10	Commercial Autobody Shops		ES-11	CS	PAHs	--
					ES-12	CS	PAHs	--
	Automobile Repair – Two automotive repair shops are listed in the City Directory at 349 Elizabeth Street from approximately 2005.	27	Garages and Maintenance and Repair of Railcars, Marine Vehicles, and Aviation Vehicles		K	TP	Metals*, EC, pH	--
					KE13	TP	PCBs	--
	Gasoline Station – A private fuel outlet with a 2,250 L liquid-fuel double-walled AST for gasoline is listed in the ERIS report for Oaks Precast Ind. Div. Standard Ind. at 351 Elizabeth Street, with a licence issue date of 1990. An additional record indicates a tank capacity of 36,500 L.	28	Gasoline and Associated Products Storage in Fixed Tanks		KNW10	TP	Metals*	--
					L	TP	Metals*, CrVI, Hg	--
	Trucking Company – A general freight trucking company (Polymer Distribution Inc.) is listed at 351 Elizabeth Street.	11	Commercial Trucking and Container Terminals		LN2	TP	PAHs, Metals*, EC, pH	--
					MW18-112D	MW	--	BTEX, VOCs, THMs, Metals, HF Metals
	Concrete Products Manufacturing – Lafarge Canada Inc. is listed at 351 Elizabeth Street, with a Scott's Manufacturing directory listing indicating an established date of 1933 and plant size of 50,000 ft^3.	12	Concrete, Cement, and Lime Manufacturing		MW18-112G	MW	--	BTEX, VOCs, THMs, HF Metals
					MW18-112S	MW	--	BTEX, VOCs, THMs, Metals, HF Metals

Table 6-4. APEC Disposition Table

Phase Two Environmental Site Assessment, 200 Beverley Street, Guelph, Ontario

Areas of Potential Environmental Concern (APEC)	PCA [a.]		COPCs (based on AP method groups [b,c])	Location Associated with APEC Area	Location Type	List of Parameter Groups Tested (soil) [b.]	List of Parameter Groups Tested (GW) [b.]
Plastic Products Manufacturing – ERIS and the City Directory searches indicate plastic products manufacturing at 53 Victoria Rd S. Scott's Manufacturing directory listings indicate Sterling Creations was established in 1983 with a 5,000 ft^2 plant size, as well as Clear Choice Window Manufacturing established in 1990 with a 1,600 ft^2 plant size.	43	Plastics (including Fibreglass) Manufacturing and Processing		MW18-113D	MW	--	BTEX, VOCs, THMs, HF Metals
				MW18-113S	MW	--	BTEX, VOCs, THMs, Metals, HF Metals, Na
				MW18-130D	MW	--	BTEX, PHCs, VOCs, THMs, Metals, HF Metals, Na
Wire/Spring Manufacturing – ERIS searches list records for Guelph Wire Products, which was established in 1974 with a plant size of 4,000 ft^2 and manufactures steel springs, wire springs, and miscellaneous fabricated wire products.	34	Metal Fabrication		MW18-131S	MW	--	BTEX, PAHs, PHCs, VOCs, THMs, Metals, HF Metals, Na
				MW18-133D	MW	--	BTEX, VOCs, THMs, Metals, HF Metals, Na
Metal Valve Manufacturing – ERIS searches list records for DeNardis Industrial Sales Ltd. at 61 Victoria Rd S Unit C for metal valve manufacturing, established in 1985, plant size 4000 ft^2.	34	Metal Fabrication		OW02	MW	--	ABNs, BTEX, CPs, PAHs, PHCs, VOCs, THMs, Metals, HF Metals, Na, Cl, CN-, CrVI, Hg
				OW07-31	MW	BTEX, PHCs, VOCs, Metals*, HF Metals, CN-, CrVI, Hg, EC, SAR, pH	ABNs, BTEX, CPs, PAHs, PCBs, PHCs, VOCs, THMs, Metals, HF Metals, Na, Cl, CN-, CrVI, Hg
Former Spill – Spill records from ERIS indicated a release of diesel fuel in 2005 at 65 Victoria South.				OW17	MW	--	BTEX, PAHs, PHCs, VOCs, THMs, Metals, HF Metals, Na, Cl, CN-, CrVI, Hg
Electro-plating company – Holody Electro-Plating Limited is listed at 66 Victoria associated with metal product coating, iron and steel mills and ferro-alloy manufacturing since 1955, with a plant size of 40,000 ft^2, according to available records from ERIS. The 1960 FIP showed labelled buildings for plating, polishing, and an office.	33	Metal Treatment, Coating, Plating, and Finishing		OW19	MW	--	BTEX, PAHs, PHCs, VOCs, THMs, Metals, HF Metals, Na, Cl, CN-, CrVI, Hg
				TP13-05	TP	BTEX, PAHs, PHCs, VOCs, THMs, Metals, HF Metals, Hg	--
				TP13-06	TP	BTEX, PAHs, PHCs, VOCs, THMs, Metals, HF Metals, Hg	--
Window and Door Manufacturing – Clear Choice Window Manufacturing Inc. and Richview Doors Ltd. are listed in the Scott's Manufacturing Directory; established in 1990 with a 1,600-ft plant size. A spill at 75 Victoria Road South of a polymer emulsion (100 lbs) in 2016 was reported.	43	Plastics (including Fibreglass) Manufacturing and Processing		TP17-304	TP	BTEX, PHCs, VOCs, THMs, Metals, HF Metals, B-HWS, CN-, CrVI, Hg, EC, SAR, pH	--
				TP17-305	TP	BTEX, PHCs, VOCs, THMs, Metals, HF Metals, B-HWS, CN-, CrVI, Hg, EC, SAR, pH	--
Scrap Yard – B&F Scrap Dealers is listed at 100 Victoria Road South, with an automobile wrecking and recycling record in ERIS and listings in the city directory search from 1970 to 2011. A spill was reported at the property of a gasoline and water mixture (quantity not specified) in 2006 from cargo leaking to the ground.	49	Salvage Yard, including automobile wrecking		TP18-319	TP	PAHs, Metals, HF Metals	--
				TP20-320	TP	BTEX, PAHs, PHCs, VOCs, THMs, Metals, HF Metals, B-HWS, CN-, CrVI, Hg, EC, SAR	--
				TP20-322	TP	BTEX, PAHs, PHCs, VOCs, THMs, Metals, HF Metals, B-HWS, CN-, CrVI, Hg, EC, SAR	--

Table 6-4. APEC Disposition Table

Phase Two Environmental Site Assessment, 200 Beverley Street, Guelph, Ontario

Areas of Potential Environmental Concern (APEC)		PCA [a.]		COPCs (based on AP method groups [b,c])	Location Associated with APEC Area	Location Type	List of Parameter Groups Tested (soil) [b.]	List of Parameter Groups Tested (GW) [b.]
APECs from Offsite PCAs to the East								
APEC-31 (Offsite East)	Steel Valve Manufacturing – Guelph Engineering Co. was shown located at 10 Kingsmill Avenue; buildings on the 1960 FIP indicate steel valve manufacturing with a machine shop, pattern shop, and oil house. Previous FIPs (1916, 1929, and 1946) show residences in this area.	32	Iron and Steel Manufacturing and Processing	ABNs, BTEX, CPs, PAHs, PCBs, PHCs, VOCs, Metals	ASW14	TP	Metals*, CrVI	--
					BH07-53	BH	BTEX, PAHs, PHCs, VOCs, Metals*, HF Metals, CN-, CrVI, Hg, EC, SAR, pH	--
	Former Stove Manufacturer/Foundry – Guelph Stove Company was shown at 490 York Road on the 1916, 1929, 1946, and 1960 FIPs. Buildings included a foundry, storage (coke, coal, sand), milling room, pattern shops, plating and buffing, offices, warehouses, steel mounting room & blacksmith, crating, stove mounting, and oil. Transformers are shown on the enamel building. Operations existed until approximately the mid-1960s where the city directory listings indicate Franklin Manufacturing Co (Canada) Ltd. and then Resco Refrigeration Supplies Co Ltd. from approximately 1970. The facility became multi-tenant commercial companies from the 1990s to present.	32	Iron and Steel Manufacturing and Processing		BH18-205	BH	BTEX, PHCs, VOCs, THMs	--
					BH19-209	BH	BTEX, VOCs, THMs	--
					BH19-211	BH	BTEX, VOCs, THMs	--
					C7	CH	Metals*	--
					L	TP	Metals*, CrVI, Hg	--
	Box Manufacturing – Packing manufacturers are listed at 136 Victoria Road South: Ellis Packing West Inc. listed as a corrugated and solid fibre box manufacturer; and ABCO Box and Carton Ltd. listed as a folding paperboard box manufacturer, established in 1946 with a plant size of 40,000 ft^2. The 1960 FIP shows ABCO Box and Carton Co. Ltd., with buildings labelled for office, pattern making, cutting, raw stock, stripping, gluing, and finished stock. ABCO Box and Carton Ltd. was present until approximately 2000, when Ellis Packing West replaced them as listed in the city directory.	45	Pulp, Paper and Paperboard Manufacturing and Processing		LN2	TP	PAHs, Metals*, EC, pH	--
					MW18-129D	MW	PAHs, PHCs, Metals, HF Metals, B-HWS, CN-, CrVI, Hg, EC, SAR, pH	BTEX, VOCs, THMs, Metals, HF Metals, Na
					MW18-130D	MW	--	BTEX, PHCs, VOCs, THMs, Metals, HF Metals, Na
					MW18-132D	MW	--	BTEX, PHCs, VOCs, THMs, Metals, HF Metals, Na
					MW19-137S	MW	--	BTEX, PHCs, VOCs, THMs
					OW09-I	MW	--	BTEX, PAHs, PHCs, VOCs, THMs, Metals, HF Metals, Na, Cl, CN-, CrVI, Hg
					OW09-II	MW	--	BTEX, PAHs, PHCs, VOCs, THMs, Metals, HF Metals, Na, Cl, CN-, CrVI, Hg
					OW13	MW	--	ABNs, BTEX, CPs, PAHs, PHCs, VOCs, THMs, Metals, HF Metals, Na, Cl, CN-, CrVI, Hg
					OW13-39D	MW	--	BTEX, PAHs, PHCs, VOCs, THMs, 1,4-dioxane, Metals, HF Metals, Na, Cl, CN-, CrVI, Hg
					OW13-39S	MW	BTEX, VOCs, THMs, Metals, HF Metals	BTEX, PAHs, PHCs, VOCs, THMs, Metals, HF Metals, Na, Cl, CN-, CrVI, Hg
					OW14	MW	--	BTEX, PAHs, PHCs, VOCs, THMs, 1,4-dioxane, Metals, HF Metals, Na, Cl, CN-, CrVI, Hg
	Potential USTs – On the 1960 FIP, McGregor Sportswear of Canada was shown to have two fuel oil USTs (2,500 gal each) on the property at 136 Victoria Road South.	28	Gasoline and Associated Products Storage in Fixed Tanks					
	Scrap Yard – Joe Brown & Son Ltd., a junk yard, is shown on the 1960 FIP at 150 Victoria; ERIS records include Henderson's Disposal Systems Ltd. as the owner and list the facility as a transfer service from 2000 to 2004, and 2005 as an Ontario numbered company.	49	Salvage Yard, including automobile wrecking					
	Former Fuel Storage Facility – Multiple companies have been listed at 154 Victoria Road South (Shell Canada Products, Doug Pollock Fuels Ltd., Granger Fuels) as an expired TSSA fuel storage facility with gasoline and diesel. A spill was reported in 1988 caused by container overflow of 150 L of gasoline to the gravel surface. The 1946 FIP shows 6 gasoline USTs, and the 1960 FIP shows 13 gasoline USTs and an oil warehouse; both listed as Canadian Oil Companies Ltd.	28	Gasoline and Associated Products Storage in Fixed Tanks					

Table 6-4. APEC Disposition Table

Phase Two Environmental Site Assessment, 200 Beverley Street, Guelph, Ontario

Areas of Potential Environmental Concern (APEC)		PCA [a.]		COPCs (based on AP method groups [b,c])	Location Associated with APEC Area	Location Type	List of Parameter Groups Tested (soil) [b.]	List of Parameter Groups Tested (GW) [b.]
	Former Paint Application – A cabinet manufacturer was shown on the 1960 FIP, Gilson Manufacturing Co. Ltd. Cabinet Division at 57 Victoria Road South, with buildings labelled for steel storage, tubing room, steel room, washer, dryer, office, paint spray, transformer.	39	Paints Manufacturing, Processing, and Bulk Storage		OW18-I	MW	--	BTEX, PAHs, PHCs, VOCs, THMs, Metals, HF Metals, Na, Cl, CN-, CrVI, Hg
					OW18-II	MW	--	BTEX, PAHs, PHCs, VOCs, THMs, Metals, HF Metals, Na, Cl, CN-, CrVI, Hg
	Chemical Manufacturer or Distributor – Robert On Guard Products was listed in the chemical facilities records.	8	Chemical Manufacturing, Processing, and Bulk Storage		OW19	MW	--	BTEX, PAHs, PHCs, VOCs, THMs, Metals, HF Metals, Na, Cl, CN-, CrVI, Hg
					OW24D	MW	--	BTEX, PAHs, PHCs, VOCs, THMs, 1,4-dioxane, Metals, HF Metals, Na, Cl, CN-, CrVI, Hg
	Transformers – The National PCB records list up to 7 transformers on 490 York Road associated with Sherwood Forest Investments (formerly Hamril Investments). The volumes listed total approximately 1,600 L. Transformers (7 total) are shown on the 1960 FIP on the enameling building of Guelph Stove Co. Ltd.	55	Transformer Manufacturing, Processing, and Use		OW24S	MW	--	ABNs, BTEX, CPs, PAHs, PCBs, PHCs, VOCs, THMs, Metals, HF Metals, Na, Cl, CN-, CrVI, Hg
					OW31	MW	--	BTEX, PAHs, PCBs, PHCs, VOCs, THMs, 1,4-dioxane, Metals, HF Metals, Na, Cl, CrVI, Hg
					TP17-305	TP	BTEX, PHCs, VOCs, THMs, Metals, HF Metals, B-HWS, CN-, CrVI, Hg, EC, SAR, pH	--
APECs from Offsite PCAs to the South								
APEC-32 (Offsite South)	Screw Manufacturing – Linread Canada Ltd. is shown on the 1960 FIP as a screw manufacturer and is listed in ERIS reports as a industrial fastener at 24 Hayes with records until 1998. "Jet" is listed as a manufacturer of metal dies at this location with records between 1993 and 1998. Multiple Scott's Directory listings are reported for this address for machinery/equipment/ industrial fan and fabricated metal tools/product manufacturing (Daltec Industries, Allen Simpson Marketing and Design) with established dates of 1984 and 1975, and records up to 2006. A spill was reported of slurry to the road in 2014.	34	Metal Fabrication	BTEX, PAHS, PHCs, VOCs, Metals	2	TP	Metals*, CrVI, Hg, EC, pH	--

					MW18-122G	MW	--	BTEX, VOCs, THMs
	Former USTs – One gasoline UST is shown on the 1960 FIP on the southern side of the building at Traders' Plumbing and Heating Supplies Limited at 150 Stevenson Street South.	28	Gasoline and Associated Products Storage in Fixed Tanks		MW18-123D	MW	BTEX, PAHs, VOCs, THMs, Metals, HF Metals, B-HWS, CN-, CrVI, Hg, EC, SAR, pH	BTEX, VOCs, THMs
					MW18-123S	MW	--	BTEX, VOCs, THMs
					OW10	MW	--	BTEX, PAHs, PHCs, VOCs, THMs, Metals, HF Metals, Na, Cl, CN-, CrVI, Hg
					OW11-I	MW	--	BTEX, PAHs, PHCs, VOCs, THMs, Metals, HF Metals, Na, Cl, CN-, CrVI, Hg
	Former Transportation Company – The 1960 FIP indicates a transportation company (Direct Winter's Transport) at 101 Beverley, and city directories show that the company was present from the early 1950s to 1960s.	11	Commercial Trucking and Container Terminals		OW11-II	MW	--	BTEX, PAHs, PHCs, VOCs, THMs, Metals, HF Metals, Na, Cl, CN-, CrVI, Hg
					OW26D	MW	--	BTEX, PAHs, PCBs, PHCs, VOCs, THMs, 1,4-dioxane, Metals, HF Metals, Na, Cl, CN-, CrVI, Hg
					OW26S	MW	--	BTEX, PAHs, PCBs, PHCs, VOCs, THMs, 1,4-dioxane, Metals, HF Metals, Na, Cl, CN-, CrVI, Hg
					TP13-10	TP	BTEX, PAHs, PHCs, VOCs, THMs, Metals, HF Metals, Hg	--

Table 6-4. APEC Disposition Table

Phase Two Environmental Site Assessment, 200 Beverley Street, Guelph, Ontario

Areas of Potential Environmental Concern (APEC)		PCA [a.]		COPCs (based on AP method groups [b,c])	Location Associated with APEC Area	Location Type	List of Parameter Groups Tested (soil) [b.]	List of Parameter Groups Tested (GW) [b.]
APECs from Offsite PCAs to the West								
APEC-33 (Offsite West)	Window Manufacturing – Clear Choice Window Manufacturing Inc. is listed in the Scott's Manufacturing Directory; established in 1990, and a 1,600-ft plant size.	43	Plastics (including Fibreglass) Manufacturing and Processing	BTEX, PAHs, PHCs, VOCs, Metals	4	TP	Metals*, CrVI, Hg, EC, pH	--
	Metal Treatment – Choice Enterprises is listed in the Scott's Manufacturing Directory as carrying out coating, engraving, heat treating, and allied activities; established in 1998.	33	Metal Treatment, Coating, Plating, and Finishing		6	TP	Metals*, CrVI, Hg, EC, pH	--
	Spring Manufacturing – ERIS records indicate heavy gauge spring manufacturing at 60 Johnston Street as Steele Bros. Ltd., the Scott's Manufacturing Directory record indicates the company was established in 1986 with a plant size of 6,500 ft^2. The 1960 FIP shows the H.I. Thompson Co. of Canada Limited (Aircraft Insulation) with a factory, spring room, spray room, transformer, and cement storage.	34	Metal Fabrication		BH07-67	BH	BTEX, PCBs, PHCs, VOCs, Metals*, HF Metals	--
					ESW8	TP	PCBs, Metals*, EC, pH	--
	Former Refractory Facility – Former Foundry Services of Canada (FOSECO) facility operated at 201 Alice Street until approximately the late 1990s and had a known contaminated plume in the shallow groundwater occurring at the bedrock/overburden interface, migrating northward and a groundwater treatment system for toluene (P&R 1991). A certificate of approval record was issued in 1989 to FOSECO for the toluene stripper for groundwater. The 1960 FIP indicates the following buildings: tablet making, lab, shipping, mixing, warehouse, ball mill, elevator, transformer, oil storage, blending, mouldable exothermic feeding compound, incinerator.	34	Metal Fabrication		EW8	TP	PCBs, Metals*	--
					MW18-120D	MW	Metals, HF Metals	BTEX, VOCs, THMs, Metals, HF Metals, Na
					OW12	MW	--	BTEX, PAHs, PHCs, VOCs, THMs, 1,4-dioxane, Metals, HF Metals, Na, Cl, CN-, CrVI, Hg
					OW15	MW	--	BTEX, PAHs, PCBs, PHCs, VOCs, THMs, Metals, HF Metals, Na, Cl, CN-, CrVI, Hg
	Motor Vehicle Parts Manufacturing FOSECO BP Canada Energy Company is listed in ERIS operating at 201 Alice Street.	57	Vehicles and Associated Parts Manufacturing		OW16	MW	--	BTEX, PAHs, PCBs, PHCs, VOCs, THMs, Metals, HF Metals, Na, Cl, CN-, CrVI, Hg
	Former Spill – At the corner of Alice and Stevenson Street, a spill was reported of 15 L of windshield washer fluid and antifreeze to a catch basin caused by a motor vehicle accident in 2016.	27	Garages and Maintenance and Repair of Railcars, Marine Vehicles, and		TP17-300	TP	ABNs, BTEX, CPs, Dioxins/Furans, PAHs, PCBs, PHCs, VOCs, THMs, Metals, HF Metals, B-HWS, CN-, CrVI, Hg, EC, SAR, pH	--

Notes:

Information provided in this table is limited to detected parameters exceeding the MECP Standards. MDLs that exceed the MECP Standards can be found in the results tables provided in Section 6.

[a] PCA – Potentially contaminating activity (as defined by O. Reg 153/04, as amended), (*) best fit available where starred.

[b] AP Method groups as defined in the "*Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act* " dated July 1, 2011.

*Based on the O. Reg. 153/04 AP method group for metals, boron and uranium are missing from metals analyses from samples collected in the 1990s and 2007; parameters based on historical laboratory parameter groups. Similarly, where arsenic was missing, HF metals was not listed as a parameter tested.

"--" = no data for the specified media

ABNs = acid base neutral compounds
APEC = area of potential environmental concern
AST = aboveground storage tank
BH = borehole
B-HWS = boron - hot water soluble
BTEX = benzene, toluene, ethylbenzene, xylene
CH = corehole
Cl = chloride
CN- = cyanide
COC = contaminant of concern
CPs = chlorophenols
CrVI = hexavalent chromium
CS = confirmatory sample
EC = electrical conductivity
ERIS = environmental risk information services
FIP = fire insurance plan
GW = groundwater
HF Metals = hydride forming metals
Hg = mercury
MDL = method detection limit
MECP = Ontario Ministry of Environment, Conservation and Parks
Metals* = incomplete metals suite missing boron and uranium
MW = monitoring well
PAHs = polyaromatic hydrocarbons
PCA = potentially contaminating activity
PCBs = polychlorinated biphenyls
PHCs = petroleum hydrocarbons
SAR = sodium adsorption ratio
SS = soil sample
TP = test pit
TSSA = technical standards and safety authority
UST = underground storage tank
VOCs = volatile organic compounds

Analyte	Table 6 SCS [a]	Unit																				

Notes:

Bold values indicate concentrations detected above the method detection limit

Shaded values indicate the result is greater than the Table 6 SCS.

Value exceeds the Ontario Typical Range.

% = percent

-- = not analyzed

µg/g = microgram(s) per gram

ABNs = acid, base and neutral compounds

BH = borehole

BTEX - benzene, toluene, ethylbenzene, and xylene

CPs = chlorophenols

DUP = duplicate

FD = field duplicate

J = associated value is estimated

m = metre(s)

MECP = Ministry of the Environment, Conservation and Parks

mg/kg = milligram(s) per kilogram

mg/l = milligram(s) per litre

mS/cm = milliSiemen(s) per centimetre

MW = monitoring well

N = normal sample

NV = no value

OCPs = organochlorine pesticides

ORPs = other regulated parameters

PCBs = polychlorinated biphenyls

pg/g = picogram(s) per gram

PHCs = petroleum hydrocarbons

SAR = sodium adsorption ratio

SVOCs = semi-volatile organic compounds

U = parameter was not detected above the associated value

VOCs = volatile organic compounds

Analyte	Table 6 SCS [a]	Unit																				

Notes:

Bold values indicate concentrations detected above the method detection limit

Shaded values indicate the result is greater than the Table 6 SCS.

Value exceeds the Ontario Typical Range.

% = percent

-- = not analyzed

µg/g = microgram(s) per gram

ABNs = acid, base and neutral compounds

BH = borehole

BTEX - benzene, toluene, ethylbenzene, and xylene

CPs = chlorophenols

DUP = duplicate

FD = field duplicate

J = associated value is estimated

m = metre(s)

MECP = Ministry of the Environment, Conservation and Parks

mg/kg = milligram(s) per kilogram

mg/l = milligram(s) per litre

mS/cm = milliSiemen(s) per centimetre

MW = monitoring well

N = normal sample

NV = no value

OCPs = organochlorine pesticides

ORPs = other regulated parameters

PCBs = polychlorinated biphenyls

pg/g = picogram(s) per gram

PHCs = petroleum hydrocarbons

SAR = sodium adsorption ratio

SVOCs = semi-volatile organic compounds

U = parameter was not detected above the associated value

VOCs = volatile organic compounds

Notes:

Bold values indicate concentrations detected above the method detection limit

Shaded values indicate the result is greater than the Table 6 SCS.

Value exceeds the Ontario Typical Range.

% = percent

-- = not analyzed

µg/g = microgram(s) per gram

ABNs = acid, base and neutral compounds

BH = borehole

BTEX - benzene, toluene, ethylbenzene, and xylene

CPs = chlorophenols

DUP = duplicate

FD = field duplicate

J = associated value is estimated

m = metre(s)

MECP = Ministry of the Environment, Conservation and Parks

mg/kg = milligram(s) per kilogram

mg/l = milligram(s) per litre

mS/cm = milliSiemen(s) per centimetre

MW = monitoring well

N = normal sample

NV = no value

OCPs = organochlorine pesticides

ORPs = other regulated parameters

PCBs = polychlorinated biphenyls

pg/g = picogram(s) per gram

PHCs = petroleum hydrocarbons

SAR = sodium adsorption ratio

SVOCs = semi-volatile organic compounds

U = parameter was not detected above the associated value

VOCs = volatile organic compounds

Analyte	Table 6 SCS [a]	Unit																			

Notes:

Bold values indicate concentrations detected above the method detection limit

Shaded values indicate the result is greater than the Table 6 SCS.

Value exceeds the Ontario Typical Range.

% = percent

-- = not analyzed

µg/g = microgram(s) per gram

ABNs = acid, base and neutral compounds

BH = borehole

BTEX - benzene, toluene, ethylbenzene, and xylene

CPs = chlorophenols

DUP = duplicate

FD = field duplicate

J = associated value is estimated

m = metre(s)

MECP = Ministry of the Environment, Conservation and Parks

mg/kg = milligram(s) per kilogram

mg/l = milligram(s) per litre

mS/cm = milliSiemen(s) per centimetre

MW = monitoring well

N = normal sample

NV = no value

OCPs = organochlorine pesticides

ORPs = other regulated parameters

PCBs = polychlorinated biphenyls

pg/g = picogram(s) per gram

PHCs = petroleum hydrocarbons

SAR = sodium adsorption ratio

SVOCs = semi-volatile organic compounds

U = parameter was not detected above the associated value

VOCs = volatile organic compounds

Notes:

Bold values indicate concentrations detected above the method detection limit

Shaded values indicate the result is greater than the Table 6 SCS.

Value exceeds the Ontario Typical Range.

% = percent

-- = not analyzed

µg/g = microgram(s) per gram

ABNs = acid, base and neutral compounds

BH = borehole

BTEX - benzene, toluene, ethylbenzene, and xylene

CPs = chlorophenols

DUP = duplicate

FD = field duplicate

J = associated value is estimated

m = metre(s)

MECP = Ministry of the Environment, Conservation and Parks

mg/kg = milligram(s) per kilogram

mg/l = milligram(s) per litre

mS/cm = milliSiemen(s) per centimetre

MW = monitoring well

N = normal sample

NV = no value

OCPs = organochlorine pesticides

ORPs = other regulated parameters

PCBs = polychlorinated biphenyls

pg/g = picogram(s) per gram

PHCs = petroleum hydrocarbons

SAR = sodium adsorption ratio

SVOCs = semi-volatile organic compounds

U = parameter was not detected above the associated value

VOCs = volatile organic compounds

Analyte	Table 6 SCS [a]	Unit																			

Notes:

Bold values indicate concentrations detected above the method detection limit

Shaded values indicate the result is greater than the Table 6 SCS.

Value exceeds the Ontario Typical Range.

% = percent

-- = not analyzed

µg/g = microgram(s) per gram

ABNs = acid, base and neutral compounds

BH = borehole

BTEX - benzene, toluene, ethylbenzene, and xylene

CPs = chlorophenols

DUP = duplicate

FD = field duplicate

J = associated value is estimated

m = metre(s)

MECP = Ministry of the Environment, Conservation and Parks

mg/kg = milligram(s) per kilogram

mg/l = milligram(s) per litre

mS/cm = milliSiemen(s) per centimetre

MW = monitoring well

N = normal sample

NV = no value

OCPs = organochlorine pesticides

ORPs = other regulated parameters

PCBs = polychlorinated biphenyls

pg/g = picogram(s) per gram

PHCs = petroleum hydrocarbons

SAR = sodium adsorption ratio

SVOCs = semi-volatile organic compounds

U = parameter was not detected above the associated value

VOCs = volatile organic compounds

Analyte	Table 6 SCS [a]	Unit																					

Notes:

Bold values indicate concentrations detected above the method detection limit

Shaded values indicate the result is greater than the Table 6 SCS.

Value exceeds the Ontario Typical Range.

% = percent

-- = not analyzed

µg/g = microgram(s) per gram

ABNs = acid, base and neutral compounds

BH = borehole

BTEX - benzene, toluene, ethylbenzene, and xylene

CPs = chlorophenols

DUP = duplicate

FD = field duplicate

J = associated value is estimated

m = metre(s)

MECP = Ministry of the Environment, Conservation and Parks

mg/kg = milligram(s) per kilogram

mg/l = milligram(s) per litre

mS/cm = milliSiemen(s) per centimetre

MW = monitoring well

N = normal sample

NV = no value

OCPs = organochlorine pesticides

ORPs = other regulated parameters

PCBs = polychlorinated biphenyls

pg/g = picogram(s) per gram

PHCs = petroleum hydrocarbons

SAR = sodium adsorption ratio

SVOCs = semi-volatile organic compounds

U = parameter was not detected above the associated value

VOCs = volatile organic compounds

Analyte	Table 6 SCS [a]	Unit																				

Notes:

Bold values indicate concentrations detected above the method detection limit

Shaded values indicate the result is greater than the Table 6 SCS.

Value exceeds the Ontario Typical Range.

% = percent

-- = not analyzed

µg/g = microgram(s) per gram

ABNs = acid, base and neutral compounds

BH = borehole

BTEX - benzene, toluene, ethylbenzene, and xylene

CPs = chlorophenols

DUP = duplicate

FD = field duplicate

J = associated value is estimated

m = metre(s)

MECP = Ministry of the Environment, Conservation and Parks

mg/kg = milligram(s) per kilogram

mg/l = milligram(s) per litre

mS/cm = milliSiemen(s) per centimetre

MW = monitoring well

N = normal sample

NV = no value

OCPs = organochlorine pesticides

ORPs = other regulated parameters

PCBs = polychlorinated biphenyls

pg/g = picogram(s) per gram

PHCs = petroleum hydrocarbons

SAR = sodium adsorption ratio

SVOCs = semi-volatile organic compounds

U = parameter was not detected above the associated value

VOCs = volatile organic compounds

Analyte	Table 6 SCS [a]	Unit																				

Notes:

Bold values indicate concentrations detected above the method detection limit

Shaded values indicate the result is greater than the Table 6 SCS.

Value exceeds the Ontario Typical Range.

% = percent

-- = not analyzed

µg/g = microgram(s) per gram

ABNs = acid, base and neutral compounds

BH = borehole

BTEX - benzene, toluene, ethylbenzene, and xylene

CPs = chlorophenols

DUP = duplicate

FD = field duplicate

J = associated value is estimated

m = metre(s)

MECP = Ministry of the Environment, Conservation and Parks

mg/kg = milligram(s) per kilogram

mg/l = milligram(s) per litre

mS/cm = milliSiemen(s) per centimetre

MW = monitoring well

N = normal sample

NV = no value

OCPs = organochlorine pesticides

ORPs = other regulated parameters

PCBs = polychlorinated biphenyls

pg/g = picogram(s) per gram

PHCs = petroleum hydrocarbons

SAR = sodium adsorption ratio

SVOCs = semi-volatile organic compounds

U = parameter was not detected above the associated value

VOCs = volatile organic compounds

Analyte	Table 6 SCS [a]	Unit																				

Notes:

Bold values indicate concentrations detected above the method detection limit

Shaded values indicate the result is greater than the Table 6 SCS.

Value exceeds the Ontario Typical Range.

% = percent

-- = not analyzed

µg/g = microgram(s) per gram

ABNs = acid, base and neutral compounds

BH = borehole

BTEX - benzene, toluene, ethylbenzene, and xylene

CPs = chlorophenols

DUP = duplicate

FD = field duplicate

J = associated value is estimated

m = metre(s)

MECP = Ministry of the Environment, Conservation and Parks

mg/kg = milligram(s) per kilogram

mg/l = milligram(s) per litre

mS/cm = milliSiemen(s) per centimetre

MW = monitoring well

N = normal sample

NV = no value

OCPs = organochlorine pesticides

ORPs = other regulated parameters

PCBs = polychlorinated biphenyls

pg/g = picogram(s) per gram

PHCs = petroleum hydrocarbons

SAR = sodium adsorption ratio

SVOCs = semi-volatile organic compounds

U = parameter was not detected above the associated value

VOCs = volatile organic compounds

Analyte	Table 6 SCS [a]	Unit																				

Notes:

Bold values indicate concentrations detected above the method detection limit

Shaded values indicate the result is greater than the Table 6 SCS.

Value exceeds the Ontario Typical Range.

% = percent

-- = not analyzed

µg/g = microgram(s) per gram

ABNs = acid, base and neutral compounds

BH = borehole

BTEX - benzene, toluene, ethylbenzene, and xylene

CPs = chlorophenols

DUP = duplicate

FD = field duplicate

J = associated value is estimated

m = metre(s)

MECP = Ministry of the Environment, Conservation and Parks

mg/kg = milligram(s) per kilogram

mg/l = milligram(s) per litre

mS/cm = milliSiemen(s) per centimetre

MW = monitoring well

N = normal sample

NV = no value

OCPs = organochlorine pesticides

ORPs = other regulated parameters

PCBs = polychlorinated biphenyls

pg/g = picogram(s) per gram

PHCs = petroleum hydrocarbons

SAR = sodium adsorption ratio

SVOCs = semi-volatile organic compounds

U = parameter was not detected above the associated value

VOCs = volatile organic compounds

Analyte	Table 6 SCS [a]	Unit																			

Notes:

Bold values indicate concentrations detected above the method detection limit

Shaded values indicate the result is greater than the Table 6 SCS.

Value exceeds the Ontario Typical Range.

% = percent

-- = not analyzed

µg/g = microgram(s) per gram

ABNs = acid, base and neutral compounds

BH = borehole

BTEX - benzene, toluene, ethylbenzene, and xylene

CPs = chlorophenols

DUP = duplicate

FD = field duplicate

J = associated value is estimated

m = metre(s)

MECP = Ministry of the Environment, Conservation and Parks

mg/kg = milligram(s) per kilogram

mg/l = milligram(s) per litre

mS/cm = milliSiemen(s) per centimetre

MW = monitoring well

N = normal sample

NV = no value

OCPs = organochlorine pesticides

ORPs = other regulated parameters

PCBs = polychlorinated biphenyls

pg/g = picogram(s) per gram

PHCs = petroleum hydrocarbons

SAR = sodium adsorption ratio

SVOCs = semi-volatile organic compounds

U = parameter was not detected above the associated value

VOCs = volatile organic compounds

Analyte	Table 6 SCS [a]	Unit																			

Notes:

Bold values indicate concentrations detected above the method detection limit

Shaded values indicate the result is greater than the Table 6 SCS.

Value exceeds the Ontario Typical Range.

% = percent

-- = not analyzed

µg/g = microgram(s) per gram

ABNs = acid, base and neutral compounds

BH = borehole

BTEX - benzene, toluene, ethylbenzene, and xylene

CPs = chlorophenols

DUP = duplicate

FD = field duplicate

J = associated value is estimated

m = metre(s)

MECP = Ministry of the Environment, Conservation and Parks

mg/kg = milligram(s) per kilogram

mg/l = milligram(s) per litre

mS/cm = milliSiemen(s) per centimetre

MW = monitoring well

N = normal sample

NV = no value

OCPs = organochlorine pesticides

ORPs = other regulated parameters

PCBs = polychlorinated biphenyls

pg/g = picogram(s) per gram

PHCs = petroleum hydrocarbons

SAR = sodium adsorption ratio

SVOCs = semi-volatile organic compounds

U = parameter was not detected above the associated value

VOCs = volatile organic compounds

Analyte	Table 6 SCS [a]	Unit																			

Notes:

Bold values indicate concentrations detected above the method detection limit

Shaded values indicate the result is greater than the Table 6 SCS.

Value exceeds the Ontario Typical Range.

% = percent

-- = not analyzed

µg/g = microgram(s) per gram

ABNs = acid, base and neutral compounds

BH = borehole

BTEX - benzene, toluene, ethylbenzene, and xylene

CPs = chlorophenols

DUP = duplicate

FD = field duplicate

J = associated value is estimated

m = metre(s)

MECP = Ministry of the Environment, Conservation and Parks

mg/kg = milligram(s) per kilogram

mg/l = milligram(s) per litre

mS/cm = milliSiemen(s) per centimetre

MW = monitoring well

N = normal sample

NV = no value

OCPs = organochlorine pesticides

ORPs = other regulated parameters

PCBs = polychlorinated biphenyls

pg/g = picogram(s) per gram

PHCs = petroleum hydrocarbons

SAR = sodium adsorption ratio

SVOCs = semi-volatile organic compounds

U = parameter was not detected above the associated value

VOCs = volatile organic compounds

Analyte		Table 6 SCS [a]	Unit																				

Notes:

Bold values indicate concentrations detected above the method detection limit

Shaded values indicate the result is greater than the Table 6 SCS.

Value exceeds the Ontario Typical Range.

% = percent

-- = not analyzed

µg/g = microgram(s) per gram

ABNs = acid, base and neutral compounds

BH = borehole

BTEX - benzene, toluene, ethylbenzene, and xylene

CPs = chlorophenols

DUP = duplicate

FD = field duplicate

J = associated value is estimated

m = metre(s)

MECP = Ministry of the Environment, Conservation and Parks

mg/kg = milligram(s) per kilogram

mg/l = milligram(s) per litre

mS/cm = milliSiemen(s) per centimetre

MW = monitoring well

N = normal sample

NV = no value

OCPs = organochlorine pesticides

ORPs = other regulated parameters

PCBs = polychlorinated biphenyls

pg/g = picogram(s) per gram

PHCs = petroleum hydrocarbons

SAR = sodium adsorption ratio

SVOCs = semi-volatile organic compounds

U = parameter was not detected above the associated value

VOCs = volatile organic compounds

Analyte	Table 6 SCS [a]	Unit																				

Notes:

Bold values indicate concentrations detected above the method detection limit

Shaded values indicate the result is greater than the Table 6 SCS.

Value exceeds the Ontario Typical Range.

% = percent

-- = not analyzed

µg/g = microgram(s) per gram

ABNs = acid, base and neutral compounds

BH = borehole

BTEX - benzene, toluene, ethylbenzene, and xylene

CPs = chlorophenols

DUP = duplicate

FD = field duplicate

J = associated value is estimated

m = metre(s)

MECP = Ministry of the Environment, Conservation and Parks

mg/kg = milligram(s) per kilogram

mg/l = milligram(s) per litre

mS/cm = milliSiemen(s) per centimetre

MW = monitoring well

N = normal sample

NV = no value

OCPs = organochlorine pesticides

ORPs = other regulated parameters

PCBs = polychlorinated biphenyls

pg/g = picogram(s) per gram

PHCs = petroleum hydrocarbons

SAR = sodium adsorption ratio

SVOCs = semi-volatile organic compounds

U = parameter was not detected above the associated value

VOCs = volatile organic compounds

Notes:

Bold values indicate concentrations detected above the method detection limit

Shaded values indicate the result is greater than the Table 6 SCS.

Value exceeds the Ontario Typical Range.

% = percent

-- = not analyzed

µg/g = microgram(s) per gram

ABNs = acid, base and neutral compounds

BH = borehole

BTEX - benzene, toluene, ethylbenzene, and xylene

CPs = chlorophenols

DUP = duplicate

FD = field duplicate

J = associated value is estimated

m = metre(s)

MECP = Ministry of the Environment, Conservation and Parks

mg/kg = milligram(s) per kilogram

mg/l = milligram(s) per litre

mS/cm = milliSiemen(s) per centimetre

MW = monitoring well

N = normal sample

NV = no value

OCPs = organochlorine pesticides

ORPs = other regulated parameters

PCBs = polychlorinated biphenyls

pg/g = picogram(s) per gram

PHCs = petroleum hydrocarbons

SAR = sodium adsorption ratio

SVOCs = semi-volatile organic compounds

U = parameter was not detected above the associated value

VOCs = volatile organic compounds

Analyte	Table 6 SCS [a]	Unit																			

Notes:

Bold values indicate concentrations detected above the method detection limit

Shaded values indicate the result is greater than the Table 6 SCS.

Value exceeds the Ontario Typical Range.

% = percent

-- = not analyzed

µg/g = microgram(s) per gram

ABNs = acid, base and neutral compounds

BH = borehole

BTEX - benzene, toluene, ethylbenzene, and xylene

CPs = chlorophenols

DUP = duplicate

FD = field duplicate

J = associated value is estimated

m = metre(s)

MECP = Ministry of the Environment, Conservation and Parks

mg/kg = milligram(s) per kilogram

mg/l = milligram(s) per litre

mS/cm = milliSiemen(s) per centimetre

MW = monitoring well

N = normal sample

NV = no value

OCPs = organochlorine pesticides

ORPs = other regulated parameters

PCBs = polychlorinated biphenyls

pg/g = picogram(s) per gram

PHCs = petroleum hydrocarbons

SAR = sodium adsorption ratio

SVOCs = semi-volatile organic compounds

U = parameter was not detected above the associated value

VOCs = volatile organic compounds

[a] MECP (2011) Table 6: Generic Site Condition Standards for Shallow Soils in a Potable Ground Water Condition, residential/parkland/institutional land use, coarse soil texture.

Source: Ontario Ministry of the Environment, Parks and Conservation (MECP). 2011. *Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act.* Ministry of the Environment. April 15.

Notes:

Bold values indicate concentrations detected above the method detection limit

Shaded values indicate the result is greater than the Table 6 SCS.

% = percent

-- = not analyzed

µg/L = microgram(s) per litre

ABNs = acid, base and neutral compounds

BTEX - benzene, toluene, ethylbenzene, and xylene

CPs = chlorophenols

FD = field duplicate

J = associated value is estimated

m = metre(s)

MECP = Ministry of the Environment, Conservation and Parks

mS/cm = milliSiemen(s) per centimetre

N = normal sample

NV = no value

OCPs = organochlorine pesticides

ORPs = other regulated parameters

PCBs = polychlorinated biphenyls

PHCs = petroleum hydrocarbons

SAR = sodium adsorption ratio

SVOCs = semi-volatile organic compounds

U = parameter was not detected above the associated value

VOCs = volatile organic compounds

[a] MECP (2011) Table 6: Generic Site Condition Standards for Shallow Soils in a Potable Ground Water Condition, residential/parkland/institutional land use, coarse soil texture.

Source: Ontario Ministry of the Environment, Parks and Conservation (MECP). 2011. *Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act.* Ministry of the Environment. April 15.

Notes:

Bold values indicate concentrations detected above the method detection limit

Shaded values indicate the result is greater than the Table 6 SCS.

% = percent

-- = not analyzed

µg/L = microgram(s) per litre

ABNs = acid, base and neutral compounds

BTEX - benzene, toluene, ethylbenzene, and xylene

CPs = chlorophenols

FD = field duplicate

J = associated value is estimated

m = metre(s)

MECP = Ministry of the Environment, Conservation and Parks

mS/cm = milliSiemen(s) per centimetre

N = normal sample

NV = no value

OCPs = organochlorine pesticides

ORPs = other regulated parameters

PCBs = polychlorinated biphenyls

PHCs = petroleum hydrocarbons

SAR = sodium adsorption ratio

SVOCs = semi-volatile organic compounds

U = parameter was not detected above the associated value

VOCs = volatile organic compounds

[a] MECP (2011) Table 6: Generic Site Condition Standards for Shallow Soils in a Potable Ground Water Condition, residential/parkland/institutional land use, coarse soil texture.

Source: Ontario Ministry of the Environment, Parks and Conservation (MECP). 2011. *Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act.* Ministry of the Environment. April 15.

Notes:

Bold values indicate concentrations detected above the method detection limit

Shaded values indicate the result is greater than the Table 6 SCS.

% = percent

-- = not analyzed

µg/L = microgram(s) per litre

ABNs = acid, base and neutral compounds

BTEX - benzene, toluene, ethylbenzene, and xylene

CPs = chlorophenols

FD = field duplicate

J = associated value is estimated

m = metre(s)

MECP = Ministry of the Environment, Conservation and Parks

mS/cm = milliSiemen(s) per centimetre

N = normal sample

NV = no value

OCPs = organochlorine pesticides

ORPs = other regulated parameters

PCBs = polychlorinated biphenyls

PHCs = petroleum hydrocarbons

SAR = sodium adsorption ratio

SVOCs = semi-volatile organic compounds

U = parameter was not detected above the associated value

VOCs = volatile organic compounds

[a] MECP (2011) Table 6: Generic Site Condition Standards for Shallow Soils in a Potable Ground Water Condition, residential/parkland/institutional land use, coarse soil texture.

Source: Ontario Ministry of the Environment, Parks and Conservation (MECP). 2011. *Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act.* Ministry of the Environment. April 15.

Notes:

Bold values indicate concentrations detected above the method detection limit

Shaded values indicate the result is greater than the Table 6 SCS.

% = percent

-- = not analyzed

µg/L = microgram(s) per litre

ABNs = acid, base and neutral compounds

BTEX - benzene, toluene, ethylbenzene, and xylene

CPs = chlorophenols

FD = field duplicate

J = associated value is estimated

m = metre(s)

MECP = Ministry of the Environment, Conservation and Parks

mS/cm = milliSiemen(s) per centimetre

N = normal sample

NV = no value

OCPs = organochlorine pesticides

ORPs = other regulated parameters

PCBs = polychlorinated biphenyls

PHCs = petroleum hydrocarbons

SAR = sodium adsorption ratio

SVOCs = semi-volatile organic compounds

U = parameter was not detected above the associated value

VOCs = volatile organic compounds

[a] MECP (2011) Table 6: Generic Site Condition Standards for Shallow Soils in a Potable Ground Water Condition, residential/parkland/institutional land use, coarse soil texture.

Source: Ontario Ministry of the Environment, Parks and Conservation (MECP). 2011. *Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act.* Ministry of the Environment. April 15.

Notes:

Bold values indicate concentrations detected above the method detection limit

Shaded values indicate the result is greater than the Table 6 SCS.

% = percent

-- = not analyzed

µg/L = microgram(s) per litre

ABNs = acid, base and neutral compounds

BTEX - benzene, toluene, ethylbenzene, and xylene

CPs = chlorophenols

FD = field duplicate

J = associated value is estimated

m = metre(s)

MECP = Ministry of the Environment, Conservation and Parks

mS/cm = milliSiemen(s) per centimetre

N = normal sample

NV = no value

OCPs = organochlorine pesticides

ORPs = other regulated parameters

PCBs = polychlorinated biphenyls

PHCs = petroleum hydrocarbons

SAR = sodium adsorption ratio

SVOCs = semi-volatile organic compounds

U = parameter was not detected above the associated value

VOCs = volatile organic compounds

[a] MECP (2011) Table 6: Generic Site Condition Standards for Shallow Soils in a Potable Ground Water Condition, residential/parkland/institutional land use, coarse soil texture.

Source: Ontario Ministry of the Environment, Parks and Conservation (MECP). 2011. *Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act.* Ministry of the Environment. April 15.

Notes:

Bold values indicate concentrations detected above the method detection limit

Shaded values indicate the result is greater than the Table 6 SCS.

% = percent

-- = not analyzed

µg/L = microgram(s) per litre

ABNs = acid, base and neutral compounds

BTEX - benzene, toluene, ethylbenzene, and xylene

CPs = chlorophenols

FD = field duplicate

J = associated value is estimated

m = metre(s)

MECP = Ministry of the Environment, Conservation and Parks

mS/cm = milliSiemen(s) per centimetre

N = normal sample

NV = no value

OCPs = organochlorine pesticides

ORPs = other regulated parameters

PCBs = polychlorinated biphenyls

PHCs = petroleum hydrocarbons

SAR = sodium adsorption ratio

SVOCs = semi-volatile organic compounds

U = parameter was not detected above the associated value

VOCs = volatile organic compounds

[a] MECP (2011) Table 6: Generic Site Condition Standards for Shallow Soils in a Potable Ground Water Condition, residential/parkland/institutional land use, coarse soil texture.

Source: Ontario Ministry of the Environment, Parks and Conservation (MECP). 2011. *Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act.* Ministry of the Environment. April 15.

Notes:

Bold values indicate concentrations detected above the method detection limit

Shaded values indicate the result is greater than the Table 6 SCS.

% = percent

-- = not analyzed

µg/L = microgram(s) per litre

ABNs = acid, base and neutral compounds

BTEX - benzene, toluene, ethylbenzene, and xylene

CPs = chlorophenols

FD = field duplicate

J = associated value is estimated

m = metre(s)

MECP = Ministry of the Environment, Conservation and Parks

mS/cm = milliSiemen(s) per centimetre

N = normal sample

NV = no value

OCPs = organochlorine pesticides

ORPs = other regulated parameters

PCBs = polychlorinated biphenyls

PHCs = petroleum hydrocarbons

SAR = sodium adsorption ratio

SVOCs = semi-volatile organic compounds

U = parameter was not detected above the associated value

VOCs = volatile organic compounds

[a] MECP (2011) Table 6: Generic Site Condition Standards for Shallow Soils in a Potable Ground Water Condition, residential/parkland/institutional land use, coarse soil texture.

Source: Ontario Ministry of the Environment, Parks and Conservation (MECP). 2011. *Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act.* Ministry of the Environment. April 15.

Notes:

Bold values indicate concentrations detected above the method detection limit

Shaded values indicate the result is greater than the Table 6 SCS.

% = percent

-- = not analyzed

µg/L = microgram(s) per litre

ABNs = acid, base and neutral compounds

BTEX - benzene, toluene, ethylbenzene, and xylene

CPs = chlorophenols

FD = field duplicate

J = associated value is estimated

m = metre(s)

MECP = Ministry of the Environment, Conservation and Parks

mS/cm = milliSiemen(s) per centimetre

N = normal sample

NV = no value

OCPs = organochlorine pesticides

ORPs = other regulated parameters

PCBs = polychlorinated biphenyls

PHCs = petroleum hydrocarbons

SAR = sodium adsorption ratio

SVOCs = semi-volatile organic compounds

U = parameter was not detected above the associated value

VOCs = volatile organic compounds

[a] MECP (2011) Table 6: Generic Site Condition Standards for Shallow Soils in a Potable Ground Water Condition, residential/parkland/institutional land use, coarse soil texture.

Source: Ontario Ministry of the Environment, Parks and Conservation (MECP). 2011. *Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act.* Ministry of the Environment. April 15.

Notes:

Bold values indicate concentrations detected above the method detection limit

Shaded values indicate the result is greater than the Table 6 SCS.

% = percent

-- = not analyzed

µg/L = microgram(s) per litre

ABNs = acid, base and neutral compounds

BTEX - benzene, toluene, ethylbenzene, and xylene

CPs = chlorophenols

FD = field duplicate

J = associated value is estimated

m = metre(s)

MECP = Ministry of the Environment, Conservation and Parks

mS/cm = milliSiemen(s) per centimetre

N = normal sample

NV = no value

OCPs = organochlorine pesticides

ORPs = other regulated parameters

PCBs = polychlorinated biphenyls

PHCs = petroleum hydrocarbons

SAR = sodium adsorption ratio

SVOCs = semi-volatile organic compounds

U = parameter was not detected above the associated value

VOCs = volatile organic compounds

[a] MECP (2011) Table 6: Generic Site Condition Standards for Shallow Soils in a Potable Ground Water Condition, residential/parkland/institutional land use, coarse soil texture.

Source: Ontario Ministry of the Environment, Parks and Conservation (MECP). 2011. *Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act.* Ministry of the Environment. April 15.

Notes:

Bold values indicate concentrations detected above the method detection limit

Shaded values indicate the result is greater than the Table 6 SCS.

% = percent

-- = not analyzed

µg/L = microgram(s) per litre

ABNs = acid, base and neutral compounds

BTEX - benzene, toluene, ethylbenzene, and xylene

CPs = chlorophenols

FD = field duplicate

J = associated value is estimated

m = metre(s)

MECP = Ministry of the Environment, Conservation and Parks

mS/cm = milliSiemen(s) per centimetre

N = normal sample

NV = no value

OCPs = organochlorine pesticides

ORPs = other regulated parameters

PCBs = polychlorinated biphenyls

PHCs = petroleum hydrocarbons

SAR = sodium adsorption ratio

SVOCs = semi-volatile organic compounds

U = parameter was not detected above the associated value

VOCs = volatile organic compounds

[a] MECP (2011) Table 6: Generic Site Condition Standards for Shallow Soils in a Potable Ground Water Condition, residential/parkland/institutional land use, coarse soil texture.

Source: Ontario Ministry of the Environment, Parks and Conservation (MECP). 2011. *Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act.* Ministry of the Environment. April 15.

Notes:

Bold values indicate concentrations detected above the method detection limit

Shaded values indicate the result is greater than the Table 6 SCS.

% = percent

-- = not analyzed

µg/L = microgram(s) per litre

ABNs = acid, base and neutral compounds

BTEX - benzene, toluene, ethylbenzene, and xylene

CPs = chlorophenols

FD = field duplicate

J = associated value is estimated

m = metre(s)

MECP = Ministry of the Environment, Conservation and Parks

mS/cm = milliSiemen(s) per centimetre

N = normal sample

NV = no value

OCPs = organochlorine pesticides

ORPs = other regulated parameters

PCBs = polychlorinated biphenyls

PHCs = petroleum hydrocarbons

SAR = sodium adsorption ratio

SVOCs = semi-volatile organic compounds

U = parameter was not detected above the associated value

VOCs = volatile organic compounds

[a] MECP (2011) Table 6: Generic Site Condition Standards for Shallow Soils in a Potable Ground Water Condition, residential/parkland/institutional land use, coarse soil texture.

Source: Ontario Ministry of the Environment, Parks and Conservation (MECP). 2011. *Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act.* Ministry of the Environment. April 15.

Notes:

Bold values indicate concentrations detected above the method detection limit

Shaded values indicate the result is greater than the Table 6 SCS.

% = percent

-- = not analyzed

µg/L = microgram(s) per litre

ABNs = acid, base and neutral compounds

BTEX - benzene, toluene, ethylbenzene, and xylene

CPs = chlorophenols

FD = field duplicate

J = associated value is estimated

m = metre(s)

MECP = Ministry of the Environment, Conservation and Parks

mS/cm = milliSiemen(s) per centimetre

N = normal sample

NV = no value

OCPs = organochlorine pesticides

ORPs = other regulated parameters

PCBs = polychlorinated biphenyls

PHCs = petroleum hydrocarbons

SAR = sodium adsorption ratio

SVOCs = semi-volatile organic compounds

U = parameter was not detected above the associated value

VOCs = volatile organic compounds

[a] MECP (2011) Table 6: Generic Site Condition Standards for Shallow Soils in a Potable Ground Water Condition, residential/parkland/institutional land use, coarse soil texture.

Source: Ontario Ministry of the Environment, Parks and Conservation (MECP). 2011. *Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act.* Ministry of the Environment. April 15.

Notes:

Bold values indicate concentrations detected above the method detection limit

Shaded values indicate the result is greater than the Table 6 SCS.

% = percent

-- = not analyzed

µg/L = microgram(s) per litre

ABNs = acid, base and neutral compounds

BTEX - benzene, toluene, ethylbenzene, and xylene

CPs = chlorophenols

FD = field duplicate

J = associated value is estimated

m = metre(s)

MECP = Ministry of the Environment, Conservation and Parks

mS/cm = milliSiemen(s) per centimetre

N = normal sample

NV = no value

OCPs = organochlorine pesticides

ORPs = other regulated parameters

PCBs = polychlorinated biphenyls

PHCs = petroleum hydrocarbons

SAR = sodium adsorption ratio

SVOCs = semi-volatile organic compounds

U = parameter was not detected above the associated value

VOCs = volatile organic compounds

[a] MECP (2011) Table 6: Generic Site Condition Standards for Shallow Soils in a Potable Ground Water Condition, residential/parkland/institutional land use, coarse soil texture.

Source: Ontario Ministry of the Environment, Parks and Conservation (MECP). 2011. *Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act.* Ministry of the Environment. April 15.

Notes:

Bold values indicate concentrations detected above the method detection limit

Shaded values indicate the result is greater than the Table 6 SCS.

% = percent

-- = not analyzed

µg/L = microgram(s) per litre

ABNs = acid, base and neutral compounds

BTEX - benzene, toluene, ethylbenzene, and xylene

CPs = chlorophenols

FD = field duplicate

J = associated value is estimated

m = metre(s)

MECP = Ministry of the Environment, Conservation and Parks

mS/cm = milliSiemen(s) per centimetre

N = normal sample

NV = no value

OCPs = organochlorine pesticides

ORPs = other regulated parameters

PCBs = polychlorinated biphenyls

PHCs = petroleum hydrocarbons

SAR = sodium adsorption ratio

SVOCs = semi-volatile organic compounds

U = parameter was not detected above the associated value

VOCs = volatile organic compounds

[a] MECP (2011) Table 6: Generic Site Condition Standards for Shallow Soils in a Potable Ground Water Condition, residential/parkland/institutional land use, coarse soil texture.

Source: Ontario Ministry of the Environment, Parks and Conservation (MECP). 2011. *Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act.* Ministry of the Environment. April 15.

Notes:

Bold values indicate concentrations detected above the method detection limit

Shaded values indicate the result is greater than the Table 6 SCS.

% = percent

-- = not analyzed

µg/L = microgram(s) per litre

ABNs = acid, base and neutral compounds

BTEX - benzene, toluene, ethylbenzene, and xylene

CPs = chlorophenols

FD = field duplicate

J = associated value is estimated

m = metre(s)

MECP = Ministry of the Environment, Conservation and Parks

mS/cm = milliSiemen(s) per centimetre

N = normal sample

NV = no value

OCPs = organochlorine pesticides

ORPs = other regulated parameters

PCBs = polychlorinated biphenyls

PHCs = petroleum hydrocarbons

SAR = sodium adsorption ratio

SVOCs = semi-volatile organic compounds

U = parameter was not detected above the associated value

VOCs = volatile organic compounds

[a] MECP (2011) Table 6: Generic Site Condition Standards for Shallow Soils in a Potable Ground Water Condition, residential/parkland/institutional land use, coarse soil texture.

Source: Ontario Ministry of the Environment, Parks and Conservation (MECP). 2011. *Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act.* Ministry of the Environment. April 15.

Notes:

Bold values indicate concentrations detected above the method detection limit

Shaded values indicate the result is greater than the Table 6 SCS.

% = percent

-- = not analyzed

µg/L = microgram(s) per litre

ABNs = acid, base and neutral compounds

BTEX - benzene, toluene, ethylbenzene, and xylene

CPs = chlorophenols

FD = field duplicate

J = associated value is estimated

m = metre(s)

MECP = Ministry of the Environment, Conservation and Parks

mS/cm = milliSiemen(s) per centimetre

N = normal sample

NV = no value

OCPs = organochlorine pesticides

ORPs = other regulated parameters

PCBs = polychlorinated biphenyls

PHCs = petroleum hydrocarbons

SAR = sodium adsorption ratio

SVOCs = semi-volatile organic compounds

U = parameter was not detected above the associated value

VOCs = volatile organic compounds

[a] MECP (2011) Table 6: Generic Site Condition Standards for Shallow Soils in a Potable Ground Water Condition, residential/parkland/institutional land use, coarse soil texture.

Source: Ontario Ministry of the Environment, Parks and Conservation (MECP). 2011. *Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act.* Ministry of the Environment. April 15.

Notes:

Bold values indicate concentrations detected above the method detection limit

Shaded values indicate the result is greater than the Table 6 SCS.

% = percent

-- = not analyzed

µg/L = microgram(s) per litre

ABNs = acid, base and neutral compounds

BTEX - benzene, toluene, ethylbenzene, and xylene

CPs = chlorophenols

FD = field duplicate

J = associated value is estimated

m = metre(s)

MECP = Ministry of the Environment, Conservation and Parks

mS/cm = milliSiemen(s) per centimetre

N = normal sample

NV = no value

OCPs = organochlorine pesticides

ORPs = other regulated parameters

PCBs = polychlorinated biphenyls

PHCs = petroleum hydrocarbons

SAR = sodium adsorption ratio

SVOCs = semi-volatile organic compounds

U = parameter was not detected above the associated value

VOCs = volatile organic compounds

[a] MECP (2011) Table 6: Generic Site Condition Standards for Shallow Soils in a Potable Ground Water Condition, residential/parkland/institutional land use, coarse soil texture.

Source: Ontario Ministry of the Environment, Parks and Conservation (MECP). 2011. *Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act.* Ministry of the Environment. April 15.

Notes:

Bold values indicate concentrations detected above the method detection limit

Shaded values indicate the result is greater than the Table 6 SCS.

% = percent

-- = not analyzed

µg/L = microgram(s) per litre

ABNs = acid, base and neutral compounds

BTEX - benzene, toluene, ethylbenzene, and xylene

CPs = chlorophenols

FD = field duplicate

J = associated value is estimated

m = metre(s)

MECP = Ministry of the Environment, Conservation and Parks

mS/cm = milliSiemen(s) per centimetre

N = normal sample

NV = no value

OCPs = organochlorine pesticides

ORPs = other regulated parameters

PCBs = polychlorinated biphenyls

PHCs = petroleum hydrocarbons

SAR = sodium adsorption ratio

SVOCs = semi-volatile organic compounds

U = parameter was not detected above the associated value

VOCs = volatile organic compounds

[a] MECP (2011) Table 6: Generic Site Condition Standards for Shallow Soils in a Potable Ground Water Condition, residential/parkland/institutional land use, coarse soil texture.

Source: Ontario Ministry of the Environment, Parks and Conservation (MECP). 2011. *Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act.* Ministry of the Environment. April 15.

Notes:

Bold values indicate concentrations detected above the method detection limit

Shaded values indicate the result is greater than the Table 6 SCS.

% = percent

-- = not analyzed

µg/L = microgram(s) per litre

ABNs = acid, base and neutral compounds

BTEX - benzene, toluene, ethylbenzene, and xylene

CPs = chlorophenols

FD = field duplicate

J = associated value is estimated

m = metre(s)

MECP = Ministry of the Environment, Conservation and Parks

mS/cm = milliSiemen(s) per centimetre

N = normal sample

NV = no value

OCPs = organochlorine pesticides

ORPs = other regulated parameters

PCBs = polychlorinated biphenyls

PHCs = petroleum hydrocarbons

SAR = sodium adsorption ratio

SVOCs = semi-volatile organic compounds

U = parameter was not detected above the associated value

VOCs = volatile organic compounds

[a] MECP (2011) Table 6: Generic Site Condition Standards for Shallow Soils in a Potable Ground Water Condition, residential/parkland/institutional land use, coarse soil texture.

Source: Ontario Ministry of the Environment, Parks and Conservation (MECP). 2011. *Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act.* Ministry of the Environment. April 15.

Notes:

Bold values indicate concentrations detected above the method detection limit

Shaded values indicate the result is greater than the Table 6 SCS.

% = percent

-- = not analyzed

µg/L = microgram(s) per litre

ABNs = acid, base and neutral compounds

BTEX - benzene, toluene, ethylbenzene, and xylene

CPs = chlorophenols

FD = field duplicate

J = associated value is estimated

m = metre(s)

MECP = Ministry of the Environment, Conservation and Parks

mS/cm = milliSiemen(s) per centimetre

N = normal sample

NV = no value

OCPs = organochlorine pesticides

ORPs = other regulated parameters

PCBs = polychlorinated biphenyls

PHCs = petroleum hydrocarbons

SAR = sodium adsorption ratio

SVOCs = semi-volatile organic compounds

U = parameter was not detected above the associated value

VOCs = volatile organic compounds

[a] MECP (2011) Table 6: Generic Site Condition Standards for Shallow Soils in a Potable Ground Water Condition, residential/parkland/institutional land use, coarse soil texture.

Source: Ontario Ministry of the Environment, Parks and Conservation (MECP). 2011. *Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act.* Ministry of the Environment. April 15.

Notes:

Bold values indicate concentrations detected above the method detection limit

Shaded values indicate the result is greater than the Table 6 SCS.

% = percent

-- = not analyzed

µg/L = microgram(s) per litre

ABNs = acid, base and neutral compounds

BTEX - benzene, toluene, ethylbenzene, and xylene

CPs = chlorophenols

FD = field duplicate

J = associated value is estimated

m = metre(s)

MECP = Ministry of the Environment, Conservation and Parks

mS/cm = milliSiemen(s) per centimetre

N = normal sample

NV = no value

OCPs = organochlorine pesticides

ORPs = other regulated parameters

PCBs = polychlorinated biphenyls

PHCs = petroleum hydrocarbons

SAR = sodium adsorption ratio

SVOCs = semi-volatile organic compounds

U = parameter was not detected above the associated value

VOCs = volatile organic compounds

[a] MECP (2011) Table 6: Generic Site Condition Standards for Shallow Soils in a Potable Ground Water Condition, residential/parkland/institutional land use, coarse soil texture.

Source: Ontario Ministry of the Environment, Parks and Conservation (MECP). 2011. *Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act.* Ministry of the Environment. April 15.

Notes:

Bold values indicate concentrations detected above the method detection limit

Shaded values indicate the result is greater than the Table 6 SCS.

% = percent

-- = not analyzed

µg/L = microgram(s) per litre

ABNs = acid, base and neutral compounds

BTEX - benzene, toluene, ethylbenzene, and xylene

CPs = chlorophenols

FD = field duplicate

J = associated value is estimated

m = metre(s)

MECP = Ministry of the Environment, Conservation and Parks

mS/cm = milliSiemen(s) per centimetre

N = normal sample

NV = no value

OCPs = organochlorine pesticides

ORPs = other regulated parameters

PCBs = polychlorinated biphenyls

PHCs = petroleum hydrocarbons

SAR = sodium adsorption ratio

SVOCs = semi-volatile organic compounds

U = parameter was not detected above the associated value

VOCs = volatile organic compounds

[a] MECP (2011) Table 6: Generic Site Condition Standards for Shallow Soils in a Potable Ground Water Condition, residential/parkland/institutional land use, coarse soil texture.

Source: Ontario Ministry of the Environment, Parks and Conservation (MECP). 2011. *Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act.* Ministry of the Environment. April 15.

Notes:

Bold values indicate concentrations detected above the method detection limit

Shaded values indicate the result is greater than the Table 6 SCS.

% = percent

-- = not analyzed

µg/L = microgram(s) per litre

ABNs = acid, base and neutral compounds

BTEX - benzene, toluene, ethylbenzene, and xylene

CPs = chlorophenols

FD = field duplicate

J = associated value is estimated

m = metre(s)

MECP = Ministry of the Environment, Conservation and Parks

mS/cm = milliSiemen(s) per centimetre

N = normal sample

NV = no value

OCPs = organochlorine pesticides

ORPs = other regulated parameters

PCBs = polychlorinated biphenyls

PHCs = petroleum hydrocarbons

SAR = sodium adsorption ratio

SVOCs = semi-volatile organic compounds

U = parameter was not detected above the associated value

VOCs = volatile organic compounds

Notes:

Bold values indicate concentrations detected above the method detection limit

Shaded values indicate the result is greater than the Table 6 SCS.

% = percent

-- = not analyzed

µg/L = microgram(s) per litre

ABNs = acid, base and neutral compounds

BTEX - benzene, toluene, ethylbenzene, and xylene

CPs = chlorophenols

FD = field duplicate

J = associated value is estimated

m = metre(s)

MECP = Ministry of the Environment, Conservation and Parks

mS/cm = milliSiemen(s) per centimetre

N = normal sample

NV = no value

OCPs = organochlorine pesticides

ORPs = other regulated parameters

PCBs = polychlorinated biphenyls

PHCs = petroleum hydrocarbons

SAR = sodium adsorption ratio

SVOCs = semi-volatile organic compounds

U = parameter was not detected above the associated value

VOCs = volatile organic compounds

[a] MECP (2011) Table 6: Generic Site Condition Standards for Shallow Soils in a Potable Ground Water Condition, residential/parkland/institutional land use, coarse soil texture.

Source: Ontario Ministry of the Environment, Parks and Conservation (MECP). 2011. *Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act.* Ministry of the Environment. April 15.

Notes:

Bold values indicate concentrations detected above the method detection limit

Shaded values indicate the result is greater than the Table 6 SCS.

% = percent

-- = not analyzed

µg/L = microgram(s) per litre

ABNs = acid, base and neutral compounds

BTEX - benzene, toluene, ethylbenzene, and xylene

CPs = chlorophenols

FD = field duplicate

J = associated value is estimated

m = metre(s)

MECP = Ministry of the Environment, Conservation and Parks

mS/cm = milliSiemen(s) per centimetre

N = normal sample

NV = no value

OCPs = organochlorine pesticides

ORPs = other regulated parameters

PCBs = polychlorinated biphenyls

PHCs = petroleum hydrocarbons

SAR = sodium adsorption ratio

SVOCs = semi-volatile organic compounds

U = parameter was not detected above the associated value

VOCs = volatile organic compounds

Notes:

µg/l = microgram(s) per litre
ABN - acid, base, and neutral compounds
BTEX = benzene, toluene, ethylbenzene, and xylenes
Ca & Mg = calcium and magnesium
F = fraction
FD = field duplicate
HF = hydride-forming
J = noted result was estimated
mbgs = metre(s) below ground surface
mS/cm = milliSiemen(s) per centimetre
N = normal sample
Na = sodium
ORP = other regulated parameters
PAH = polycyclic aromatic hydrocarbons
PCB = polychlorinated biphenyls
pg/g = picogram(s) per gram
PHC = petroleum hydrocarbons
SAR = sodium adsorption ratio
SDG = sample delivery group
VOC = volatile organic compounds

Table 6-10c. Rationale for the Removal of Groundwater COCs with Subsequent Sampling Events

Phase Two Environmental Site Assessment, 200 Beverley Street, Guelph, Ontario

Parameter Group	Parameter	Category	Sample(s)	Comment/Rationale
BTEX	Benzene Ethylbenzene	Parameters with existing SCS, one exceedance and subsequent samples meeting SCS	OW22S exceedance in 2016, subsequent two events in 2017 and 2018 meet SCS	Benzene was measured at 1.1 µg/L and ethylbenzene at 7.1 µg/L in 2016 at OW22S. Historical analyses from seven sampling events and two sampling events in 2017 and 2018 at this location met the SCS of 0.5 and 2.4 µg/L, respectively. Based on the available information, these parameters were determined to likely not be present at OW22S at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, they were not carried through for the dataset for the Risk Assessment. The parameters were retained as a COCs for the Phase Two Property based on other locations exceeding the SCS.
METALS	Antimony	Parameters with existing SCS, one exceedance and subsequent samples meeting SCS	MW18-114D exceedance in December 2018, subsequent two events in 2018 and 2019 meet SCS	Antimony was measured at a concentration of 6.2 µg/L in December 2018 at the newly installed MW18-114D. Antimony was not detected at concentrations greater than the SCS in the shallower MW18-114S nested with MW18-114D. Two subsequent sampling events in December 2018 and March 2019 had concentrations less than the SCS at 1.54 µg/L and 0.12 µg/L, respectively. The other samples in groundwater (101 samples) on the Phase Two Property met the SCS. Based on the available information, this parameter was determined to likely not be present at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, it was not considered to be a COC for the Phase Two Property.
METALS	Arsenic	Parameters with existing SCS, one exceedance and subsequent samples meeting SCS	MW17-101D exceedance in 2017, subsequent two events in 2018 meet SCS	Arsenic was measured at 44.8 µg/L in 2017 at MW17-101D. Subsequent two sampling events in 2018 are significantly below the SCS of 25 µg/L, at 6.87 and 6.19 µg/L. Based on the available information, this parameter was determined to likely not be present at concentrations exceeding the SCS at this location; however, it was carried through as a COC because of detected concentrations exceeding the SCS at another location on the Phase Two Property.
METALS	Cobalt	Parameters with existing SCS, one exceedance and subsequent samples meeting SCS	OW11-II exceedance in 2017, subsequent two events in 2018 meet SCS	Cobalt was measured at 5.79/5.74 µg/L in 2017 at OW11-II. No historical samples at this location were analyzed for cobalt. Subsequent two sampling events in 2018 are less than the SCS of 3.8 µg/L, at 1.36 and < 0.10 µg/L. The other samples in groundwater (90 samples) on the Phase Two Property met the SCS. Based on the available information, this parameter was determined to likely not be present at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, it was not considered to be a COC for the Phase Two Property.
METALS	Lead	Parameters with existing SCS, one exceedance and subsequent samples meeting SCS	OW07-33 exceedance in 2017, subsequent two events in 2018 meet SCS	Lead was measured at 15/15.6 µg/L in 2017 at OW07-33. A sample collected in 2007 met the SCS of 10 µg/L, with a concentration of 4.07 µg/L along with two subsequent sampling events in 2018, at 8.9 and 7.37/7.68 µg/L. Based on the available information, this parameter was determined to likely not be present at concentrations exceeding the SCS at this location; however, was carried through as a COC because of detected concentrations exceeding the SCS at another location on the Phase Two Property.
METALS	Uranium	Parameters with existing SCS, one exceedance and subsequent samples meeting SCS	OW22S exceedance in 2017, subsequent two events in 2018 meet SCS	Uranium was measured at 25.9 µg/L in 2017 at OW22S. No historical samples at this location were analyzed for uranium. Subsequent two sampling events in 2018 were less than the SCS of 20 µg/L, at 7.24 and 6.05 µg/L. The other samples in groundwater (84 samples) on the Phase Two Property met the SCS. Based on the available information, this parameter was determined to likely not be present at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, it was not considered to be a COC for the Phase Two Property.
METALS	Zinc	Parameters with existing SCS, one exceedance and subsequent samples meeting SCS	OW26S exceedance in 2012, subsequent three events meet SCS; OW12 exceedance in 2010, subsequent three events meet SCS.	Zinc was measured at concentrations of 900 µg/L and 910 µg/L at OW26S and OW12, respectively. Historical analyses at these locations had zinc concentrations less than the SCS. Three subsequent sampling events at each location (in 2013, 2014, and 2017 for OW26S; and in 2011 [two samples] and 2017 for OW12) had concentrations of zinc less than the SCS. Based on the available information, this parameter was determined to likely not be present at concentrations exceeding the SCS at these locations; however, it was carried through as a COC because of detected concentrations exceeding the SCS at another location on the Phase Two Property.
METALS	Zinc	Parameters with existing SCS, one exceedance and subsequent samples meeting SCS	OW07-37 exceedance in 2007, subsequent two events in 2017 and 2019 meet SCS.	Zinc was measured at a concentration of 1,630 µg/L in 2007 at OW07-37 greater than the SCS of 890 µg/L. Two subsequent sampling events conducted in 2017 and 2019 had concentrations less than the SCS of 681 µg/L and 744 µg/L, respectively. Based on the available information, this parameter was determined to likely not be present at concentrations exceeding the SCS at this location; however, it was carried through as a COC because of detected concentrations exceeding the SCS at another location on the Phase Two Property.

Table 6-10c. Rationale for the Removal of Groundwater COCs with Subsequent Sampling Events

Phase Two Environmental Site Assessment, 200 Beverley Street, Guelph, Ontario

Parameter Group	Parameter	Category	Sample(s)	Comment/Rationale
PAH	Benzo(a)pyrene	Parameters with existing SCS, previous exceedances and current samples meeting SCS	OW03-I exceedance in various years, subsequent two events in 2017 and 2019 meet SCS	Benzo(a)pyrene has been measured at concentration ranging from 0.0011 to 0.02 µg/L in OW03-I, greater than the SCS of 0.01 µg/L. Concentrations have been nondetect and less than the SCS in two previous sampling events (2012 and 2013) and two subsequent sampling events completed in 2017 and 2019. Based on the available information, this parameter was determined to likely not be present at concentrations exceeding the SCS at this location; however, it was carried through as a COC because of detected concentrations exceeding the SCS at another location on the Phase Two Property.
PAH	Benzo(a)pyrene Benzo(k)fluoranthene Benzo(b&j)fluoranthene	Parameters with existing SCS, previous exceedances and current samples meeting SCS	OW25 exceedance in various years, subsequent two events in 2019 meet SCS	Benzo(a)pyrene has been measured at concentrations ranging from 0.034 to 1 µg/L in OW25, greater than the SCS of 0.01 µg/L in October 2010 and October 2018. Concentrations have been nondetect in 2010 (March), 2011 (two sampling events), 2012, 2013, 2014, 2015, 2016, 2017, and 2019 (two sampling events). Benzo(k)fluoranthene has been measured at a concentration of 0.26 µg/L, greater than the SCS of 0.1 µg/L in September 2011. Concentrations have been nondetect in three previous sampling events and nine subsequent sampling events. Benzo(b&j)fluoranthene has been measured at concentrations ranging from 1.1 to 3.1 µg/L, greater than the SCS of 0.1 µg/L in November 2015 and October 2016. Concentrations have been nondetect in seven previous sampling events and four subsequent sampling events. Based on the available information, these parameters were determined to likely not be present at concentrations exceeding the SCS at this location; however, they were carried through as a COCs because of detected concentrations exceeding the SCS at another location on the Phase Two Property.
PCB	PCBs, Total	Parameters with existing SCS, one exceedance and subsequent samples meeting SCS	OW26S exceedance in 2010, subsequent two events in 2011 and 2017 meet SCS	PCBs were measured at 1.27 µg/L in 2010 at OW26S. Subsequent sampling events in 2011 and 2017 were reported with nondetect concentrations and RLs less than the SCS of 0.20 µg/L. The other samples in groundwater (24 samples) on the Phase Two Property met the SCS. Based on the available information, this parameter was determined to likely not be present at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, it was not considered to be a COC for the Phase Two Property.
PHCs	PHC F2	Parameters with existing SCS, one exceedance and subsequent samples meeting SCS	OW18-II exceedance in 2015, subsequent two events meet SCS	PHC F2 was measured at 210 µg/L in 2015 at OW18-II in November 2015. Six previous sampling events (2010, 2011 [two samples], 2012, 2013, and 2014) and two subsequent sampling events (2016 and 2017) reported concentrations less than the SCS. Based on the available information, this parameter was determined to likely not be present at concentrations exceeding the SCS at this location; however, it was carried through as a COC because of detected concentrations exceeding the SCS at another location on the Phase Two Property.
VOC	Chloroform	Parameter with "introduced" exceedance	1 sample from MW18-112G had a detected exceedance of the SCS from December 2018.	The initial groundwater sample collected on November 22, 2018, from MW18-112D after drilling/bedrock coring, purging, and well development had a concentration of 5.8 µg/L greater than the SCS of 2 µg/L. The source of the chloroform exceedance was believed to be related to the municipal water that was used during the bedrock coring process. Two samples, one from the water truck and one from the water truck hose that was used during the coring activities, were analyzed for VOCs. VOCs were nondetect in these samples apart from bromodichloromethane (12.5 to 12.9 µg/L), dibromochloromethane (11.5 to 11.8 µg/L), and chloroform (9.8 to 10.1 µg/L). These analytes are trihalomethanes that are typically present in municipally treated water. Two subsequent groundwater samples were collected on November 29 and December 3, 2019, with nondetect concentrations of chloroform less than the SCS. The wells across the site were sampled for VOCs in 2020, and each sample reported nondetect concentrations of chloroform less than the SCS. Based on the available information, this parameter was determined to likely not be present at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, it was not considered to be a COC for the Phase Two Property.

Notes:
The rationale for the exclusion of anomalous data listed in this table is based on the data collected as part of the ESA and only applies to this ESA.

µg/L = micrograms per gram
ABN = acid, base, and neutral compound
APEC = area of potential environmental concern
COC = contaminant of concern
COPC = contaminant of potential concern
CP = chlorophenol
ESA = Environmental Site Assessment
mbgs = metre(s) below ground surface
RL = laboratory reporting limit
MECP = Ontario Ministry of the Environment, Conservation and Parks
No. = number
OCP = organochlorine pesticide
PAH = polycyclic aromatic hydrocarbon
PCA = potentially contaminating activity
PCB = polychlorinated biphenyl
PHC = petroleum hydrocarbon
QPESA = MECP Qualified Person for Environmental Site Assessment
RSC = Record of Site Condition
SCS = Site Condition Standards
VOC = volatile organic compound

Table 6-10d. Contaminants of Concern Identified in Groundwater

Phase Two Environmental Site Assessment, 200 Beverley Street, Guelph, Ontario

Groundwater COCs	
1,1,1-Trichloroethane	F1 (C6-C10)
1,1-Dichloroethane	F2 (C10-C16)
1,1-Dichloroethene	F3 (C16-C34)
2-(1-)Methylnaphthalene	F4 (C34-C50)
Acenaphthene	Fluoranthene
Anthracene	Lead
Arsenic	Naphthalene
Benzene	n-Hexane
Benzo(a)anthracene	Phenanthrene
Benzo(a)pyrene	Pyrene
Benzo(b&j)fluoranthene	Tetrachloroethene
Benzo(k)fluoranthene	trans-1,2-Dichloroethene
Chrysene	Trichloroethylene
cis-1,2-Dichloroethene	Vinyl Chloride
Ethylbenzene	Zinc

Notes:

COC = contaminant of concern

F = fraction

Notes:
1. Ground surface elevations at borehole locations may be different than current grade as some locations are projected onto the cross-section line and ground surface elevations may have changed since the time of drilling for historical locations.
2. The offset distance from the cross-section line are shown in brackets following the location ID.
3. masl = metres above sea level
4. Stratigraphic units presented on the cross-sections are based on Jacobs' interpretation of the Site's geology and may differ from those noted on logs from investigations by others.
5. The average water table elevation of 312.9 masl for monitoring events between December 2017 and August 2018 is presented. Groundwater elevations at the Site ranged between 312.5 and 313.7 masl during this period.

- Former IMICO Property Boundary
- Historical Excavation area, EarthTech, 1999
- Horizontal Delineation

Notes:
1. Historical locations are approximate. All samples, including those within excavation areas that have been removed (i.e. prior to 1999) have been shown for screening purposes.
2. Results in ( ) indicate field duplicates.
3. "J" indicates associated value is estimated.
4. Red text indicates the location of the Site maximum concentration of the analyte.
5. The estimated extent of impacts was inferred to extend from sampling locations that exceeded the Standards to the next available sampling location that did not exceed the Standards and extrapolated to the property boundary, where applicable.

Notes:
1. Ground surface elevations at borehole locations may be different than current grade as some locations are projected onto the cross-section line and ground surface elevations may have changed since the time of drilling for historical locations.
2. The offset distance from the cross-section line are shown in brackets following the location ID.
3. masl = metres above sea level
4. Stratigraphic units presented on the cross-sections are based on Jacobs' interpretation of the Site's geology and may differ from those noted on logs from investigations by others.
5. The average water table elevation of 312.9 masl for monitoring events between December 2017 and August 2018 is presented. Groundwater elevations at the Site ranged between 312.5 and 313.7 masl during this period.

Notes:
1. Ground surface elevations at borehole locations may be different than current grade as some locations are projected onto the cross-section line and ground surface elevations may have changed since the time of drilling for historical locations.
2. The offset distance from the cross-section line are shown in brackets following the location ID.
3. masl = metres above sea level
4. Stratigraphic units presented on the cross-sections are based on Jacobs' interpretation of the Site's geology and may differ from those noted on logs from investigations by others.
5. The average water table elevation of 312.9 masl for monitoring events between December 2017 and August 2018 is presented. Groundwater elevations at the Site ranged between 312.5 and 313.7 masl during this period.

Former IMICO Property Boundary
Historical Excavation area, EarthTech, 1999
Horizontal Delineation

Notes:
1. Historical locations are approximate. All samples, including those within excavation areas that have been removed (i.e. prior to 1999) have been shown for screening purposes.
2. Results in ( ) indicate field duplicates.
3. "J" indicates associated value is estimated.
4. Red text indicates the location of the Site maximum concentration of the analyte.
5. The estimated extent of impacts was inferred to extend from sampling locations that exceeded the Standards to the next available sampling location that did not exceed the Standards and extrapolated to the property boundary, where applicable.
6. Parameter(s) previously exceeding are considered to meet the SCS based on two clean subsequent samples. See Table 6-10c for additional details.

Niagara Falls Member Grainstone (Goat Island Formation)

Notes:
1. Ground surface elevations at borehole locations may be different than current grade as some locations are projected onto the cross-section line and ground surface elevations may have changed since the time of drilling for historical locations.
2. The offset distance from the cross-section line are shown in brackets following the location ID.
3. masl = metres above sea level
4. Stratigraphic units presented on the cross-sections are based on Jacobs' interpretation of the Site's geology and may differ from those noted on logs from investigations by others.
5. The average water table elevation of 312.9 masl for monitoring events between December 2017 and August 2018 is presented. Groundwater elevations at the Site ranged between 312.5 and 313.7 masl during this period.
6. Parameter(s) previously exceeding are considered to meet the SCS based on two clean subsequent samples. See Table 6-10c for additional details.

Niagara Falls Member Grainstone (Goat Island Formation)

Notes:
1. Ground surface elevations at borehole locations may be different than current grade as some locations are projected onto the cross-section line and ground surface elevations may have changed since the time of drilling for historical locations.
2. The offset distance from the cross-section line are shown in brackets following the location ID.
3. masl = metres above sea level
4. Stratigraphic units presented on the cross-sections are based on Jacobs' interpretation of the Site's geology and may differ from those noted on logs from investigations by others.
5. The average water table elevation of 312.9 masl for monitoring events between December 2017 and August 2018 is presented. Groundwater elevations at the Site ranged between 312.5 and 313.7 masl during this period.

LEGEND

- Complete pathway
- Pathway/receptor present
- No receptor present or incomplete pathway
- Pathway will be considered qualitatively based on quantitative results of a surrogate receptor

BTEX = benzene, toluene, ethylbenzene, xylenes

COC = contaminant of concern

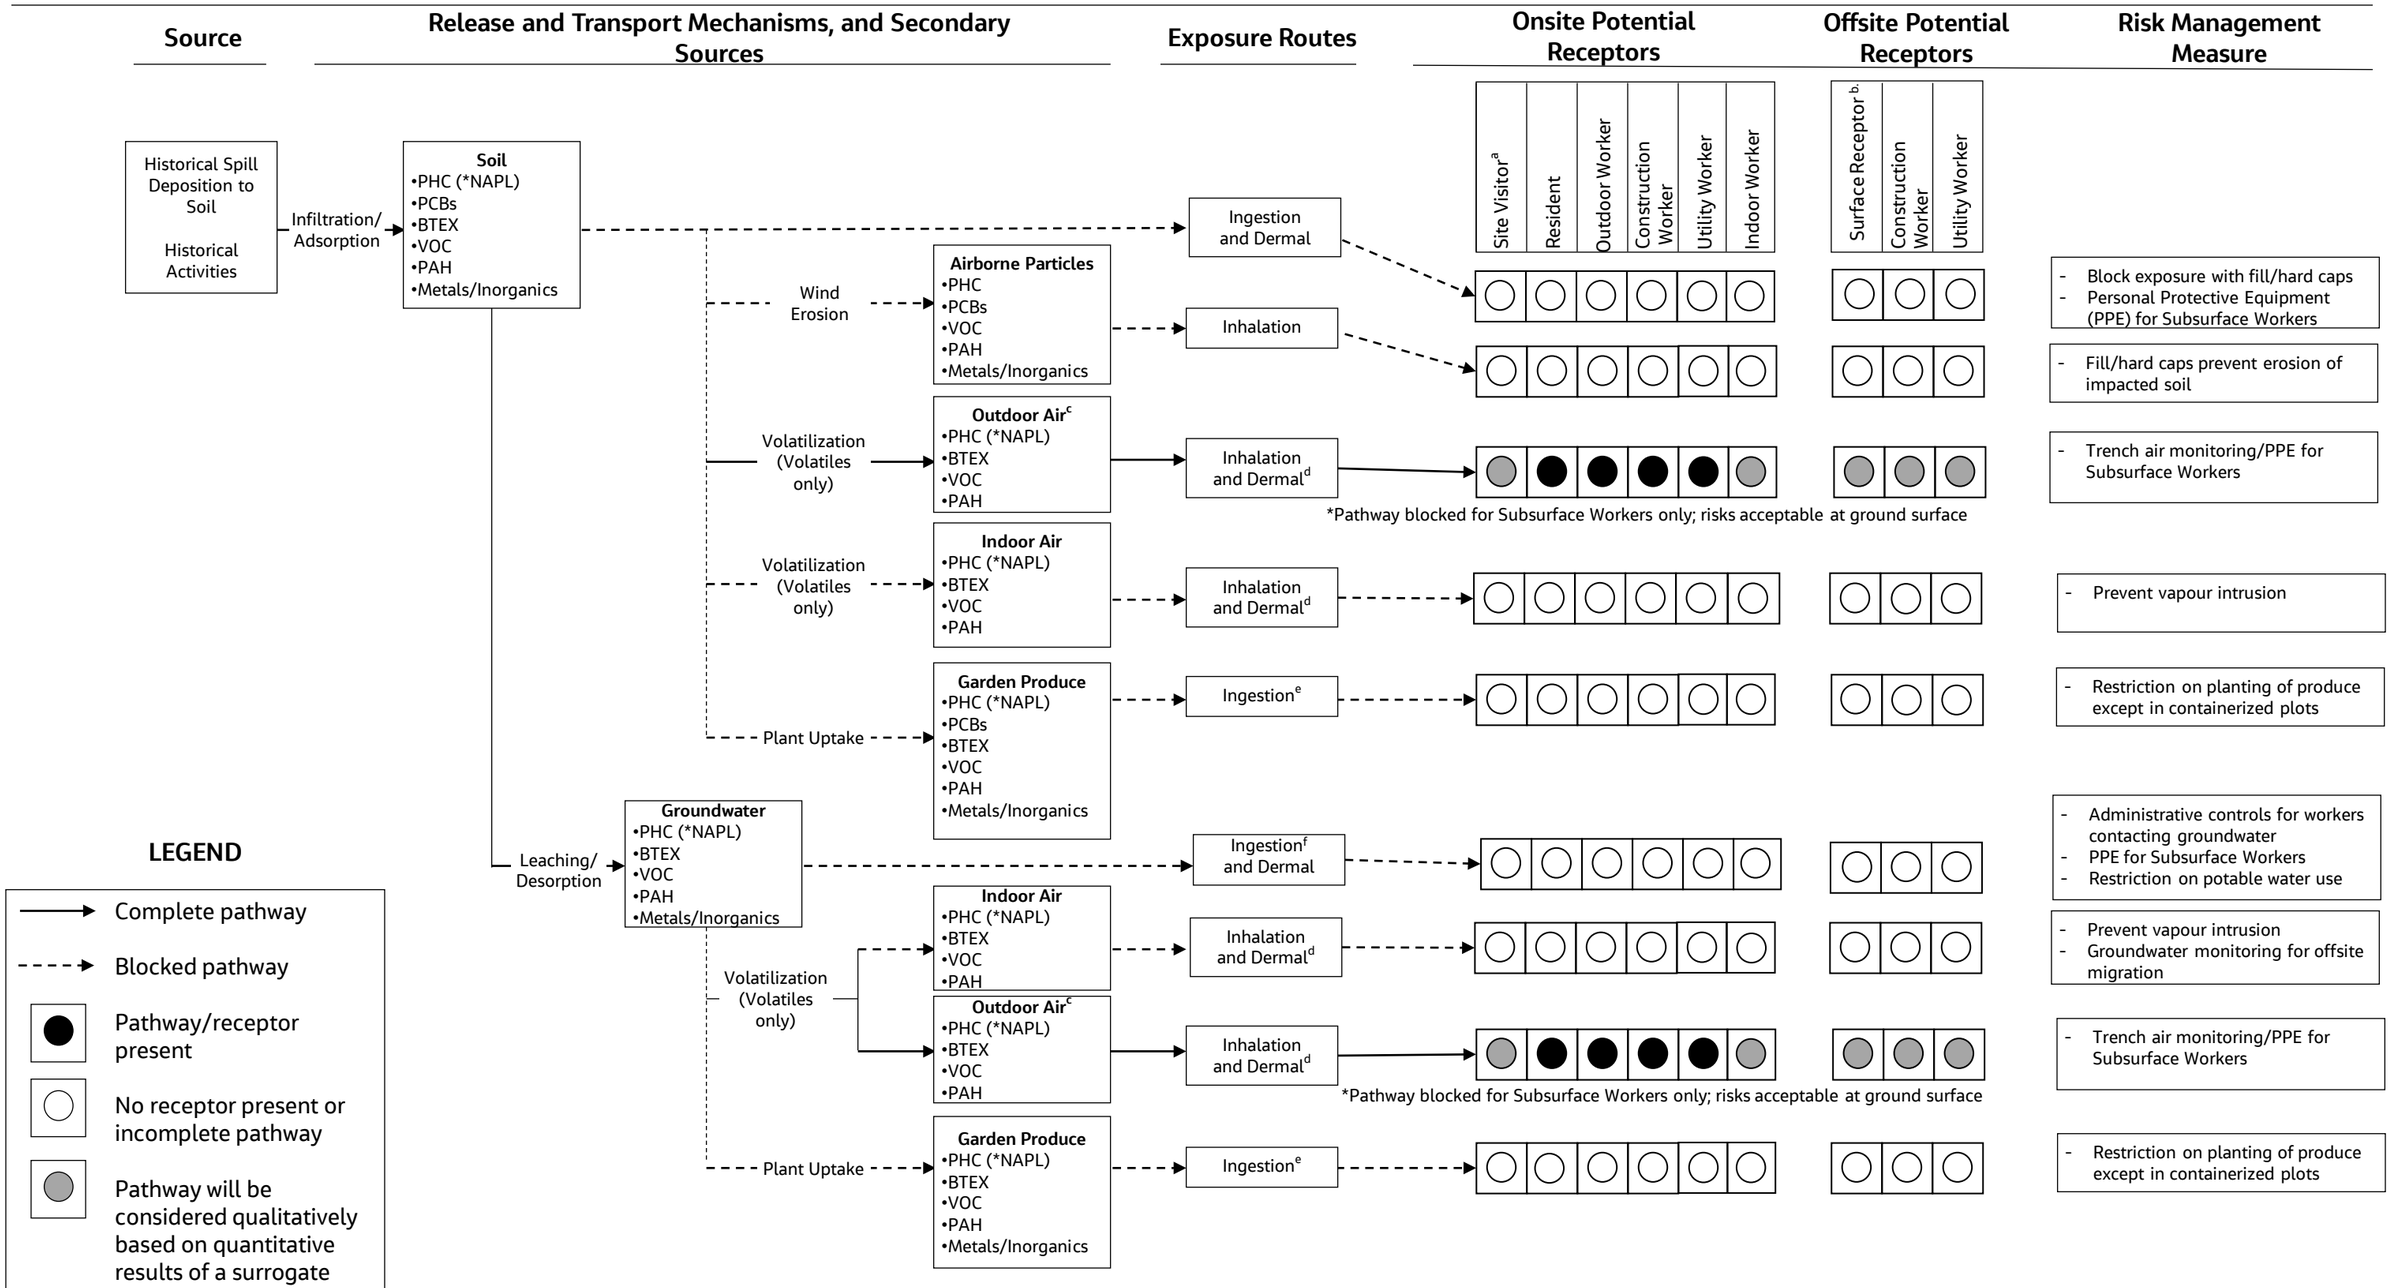
NAPL = nonaqueous phase liquid
PAH = polycyclic aromatic hydrocarbon
PCB = polychlorinated biphenyl
PHC = petroleum hydrocarbon
RMM = risk management measure
VOC = volatile organic compound

Notes:
* As part of the Phase Two ESA investigation, measurable NAPL (associated with PHCs) was present in three monitoring wells in the eastern portion of the Site.

a. Site Visitors from all age categories would be anticipated to frequent the Site.
b. Surface Receptor incorporates offsite surface receptors (that is, receptors not engaged in subsurface excavation activities), such as indoor workers, residents, visitors, outdoor workers, or patrons of nearby properties that may be exposed to dust (soil particulates) or groundwater migrating offsite during the redevelopment of the property in the absence of RMMs.
c. Outdoor air inhalation includes both ambient and trench air inhalation, as appropriate.
d. Dermal exposure to vapours is a negligible pathway and will not be considered quantitatively.
e. There is high uncertainty associated with assessing the potential exposure to site COCs through ingestion of garden produce; therefore this pathway will not be considered quantitatively.
f. As groundwater at the Site is potable, the ingestion of groundwater pathway includes both incidental ingestion (as a result of subsurface activities) and ingestion of water from the municipal water supply

Figure 6-22. Human Health Conceptual Site Model
200 Beverley Street, Guelph, Ontario)

Jacobs



LEGEND

- Complete pathway
- Blocked pathway
- Pathway/receptor present
- No receptor present or incomplete pathway
- Pathway will be considered qualitatively based on quantitative results of a surrogate receptor

COC = contaminant of concern
PAH = polycyclic aromatic hydrocarbon
PCB = polychlorinated biphenyl
PHC = petroleum hydrocarbon
RMM = risk management measure
BTEX = benzene, toluene, ethylbenzene, xylenes

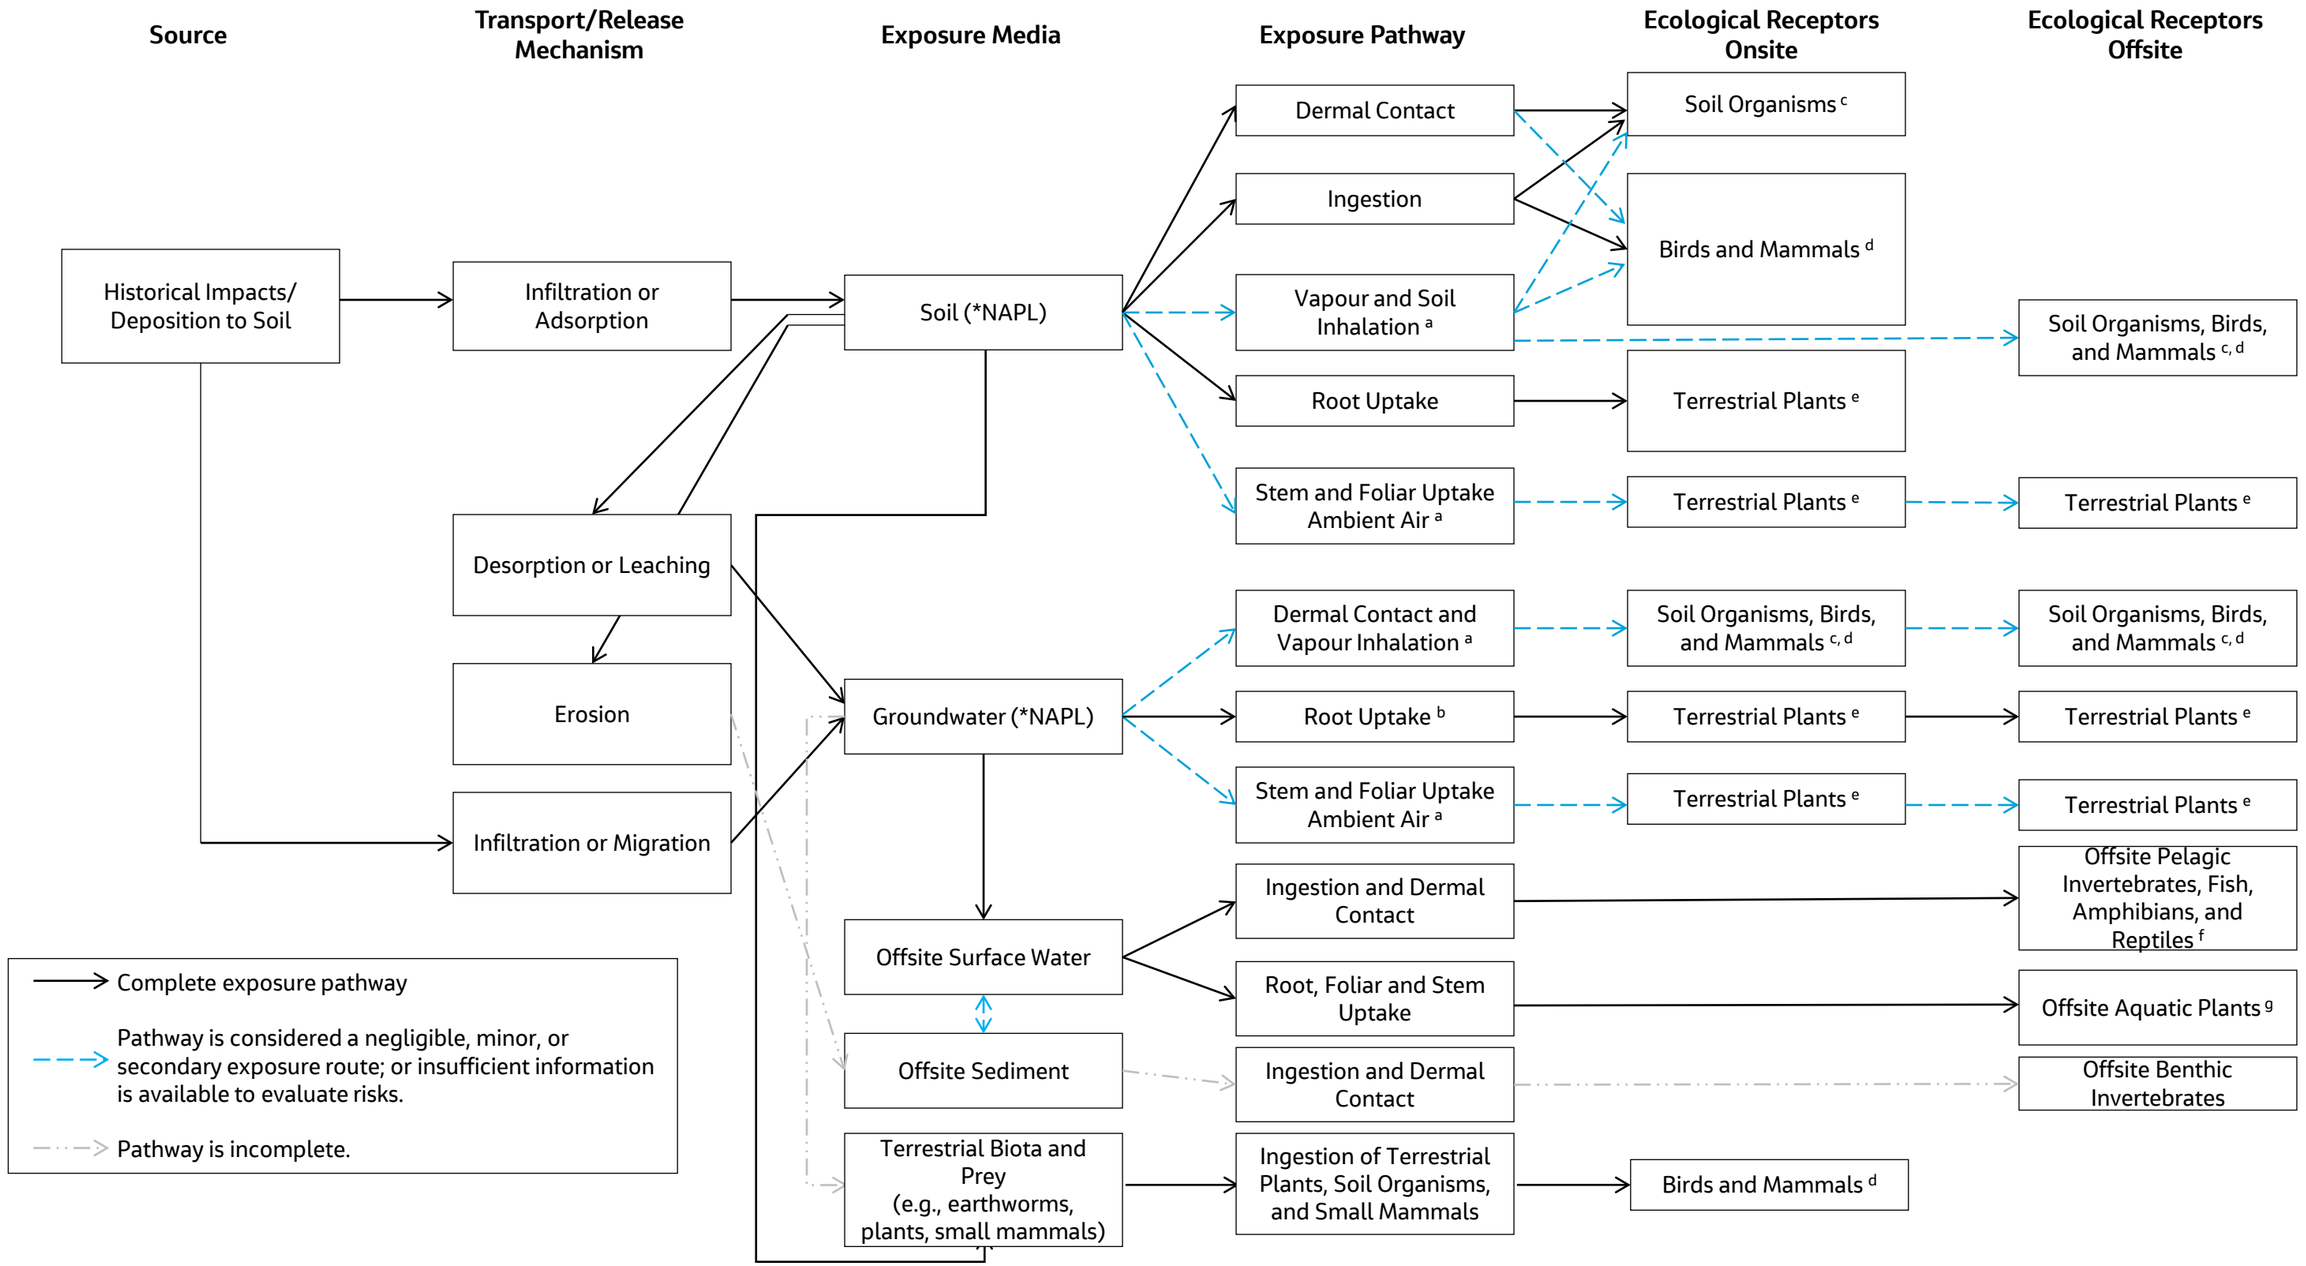
Figure 6-23. Human Health Conceptual Site Model with Risk Management Measures 200 Beverley Street, Guelph, Ontario)

Jacobs



Notes:
* As part of the Phase Two ESA investigation, measurable nonaquous phase liquid (NAPL) (associated with PHCs) was present in three monitoring wells in the eastern portion of the Site.
a. Vapour and soil inhalation, and uptake of ambient air are secondary routes of exposure; limited toxicological information is available to evaluate these pathways.
b. Minimum depth to groundwater is less than 1.5 metres below ground surface.
c. Selected VECs: Earthworms for soil organisms.
d. Selected VECs: American Woodcock, Red-winged Blackbird, and Red-tailed Hawk for birds; Meadow Vole, Red Fox, and Short-tailed Shrew for mammals.
e. Selected VECs: Grasses and Manitoba Maple for terrestrial plants.
f. Selected VECs: Daphnia for pelagic invertebrates; Common Shiner and Northern Pike for fish; Green Frog for amphibians; and Midland Painted Turtle for reptiles.
g. Selected VECs: *Carex spp.* for aquatic plants.

LOG OF TEST PIT 12SE10

EO: 90K26
Project: IMICO, Guelph, Ontario
Location: See Figure 5

Date: January 22, 1991
Field Supervisor: J.P. Francois
Elevation of Ground Surface: 315.01

Elevation MASL	Depth Metres	Depth Feet	Soil Description	Remarks
315.01	0.00	0.00	Topsoil – sand dark brown	
314.91	0.10	0.33		
314.81	0.20	0.66	Fill – Gravel	
314.71	0.30	0.98	Fill – Silt, black	Sample 12SE10–1
314.61	0.40	1.31	Fill – Sand, red to black with gravel	Sample 12SE10–2
314.51	0.50	1.64		
314.41	0.60	1.97		
314.31	0.70	2.30		
314.21	0.80	2.62		
314.11	0.90	2.95		
314.01	1.00	3.28		
313.91	1.10	3.61		
313.81	1.20	3.94		
313.71	1.30	4.26		
313.61	1.40	4.59	Silt, brown	
313.51	1.50	4.92	Sand till, brown with cobbles	Sample 12SE10–3
313.41	1.60	5.25	and boulders	
313.31	1.70	5.58	Bedrock	End of Test Pit – 1.7m
313.21	1.80	5.90		
313.11	1.90	6.23

1	33	SS2	23									0.7
						Metals & Inorg. (18:02) (1.22-1.68)	- Trace black sand below 1.30 mbgs.					
	46	SS3	7									0.7
							SILTY SAND AND GRAVEL WITH COBBLES: Light grey to light brown, moist, fine to coarse sand and gravel.		313.68 / 1.73			
2	64	SS4	50/ 20cm			Metals & Inorg. PAHs PHCs & BTEX VOCs (18:12) (1.83-2.13)	- Sampler refusal at 2.18 mbgs, ream PW casing to 2.59 mbgs, PQ coring from 2.26 mbgs.		313.15 / 2.26	313.12 / 2.29	123 mm corehole	2.0
					4		**GUELPH FORMATION AND ERAMOSA FORMATION / STONE ROAD MEMBER DOLOSTONE:** Light brown, fosiliferous, fine grained, medium strong, slightly weathered, very close to close fracture spacing, thinly bedded, slightly to moderately fractured core, some vugs (<15 mm).					
					2		- Fe staining in 75% of fractures from 2.69 to 4.80 mbgs.					
	100	Run1		29	1							
3							- Water return loss observed below 3.17 mbgs, continues for remainder of corehole.					
					4		- Highly weathered partly open to open fractures at 3.18, 3.28, 3.48 and 3.65 mbgs; potentially water bearing.					
					3							
4					+10		- Light greyish brown, frequent large vugs (<60 mm), moderately decomposed, increased weathering below 3.71 mbgs.					
	100	Run2		40			- Fracture zone 4.14 to 4.80 mbgs.					
					+10							
					+10							
										310.53 / 4.88		
5					4		- Vugs less frequent below 4.90 mbgs, trace fossils <5 mm.				96 mm corehole	
					2		- 85 mm vug at 5.13 mbgs, mineral carbonate lining and Fe staining.					
					0		- Highly weathered open fracture (up to 6 cm from fracture), potentially water bearing, at 5.49 mbgs.					
	98	Run3		80			- 10 cm long, very tight vertical fracture at 5.74 mbgs.					
					3				309.49 / 5.92			
6					1		**ERAMOSA FORMATION / REFORMATORY QUARRY MEMBER DOLOSTONE:** Light to dark greyish brown, strong, fresh to slightly weathered, close fracture spacing, sound core. Bedding planes more evident, trace fossils <5 mm, some vugs < 15 mm.					
					3		- PQ core to 6.43 mbgs, ream HW casing to 6.63 mbgs, HQ coring from 6.40 mbgs.					
					2		- Increased frequency of vugs 6.71 to 7.01 mbgs.					
7					1							
	100	Run4		70			- Very tight vertical fracture 7.24 to 7.44 mbgs.					
					4							
					1		- 7.62 to 7.92 mbgs frequent vugs (<30 mm), increased weathering, decreased strength from 7.75 mbgs.					
					2

BOREHOLE/COREHOLE COMPLETION DETAILS:
- 1.04 m stick up
- Monument casing secured in concrete
- 267 mm borehole
- Bentonite chip seal
- 96 mm corehole
- #3 silica sand filter pack
- 50 mm diameter SCH 40 PVC pipe #10-slot well screen

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Laboratory Control Sample	Pentachlorophenol	LCS-H	L1983964-4
Matrix Spike	Chloride (Cl)	MS-B	L1983964-1, -2, -3, -4, -5, -6, -7
Matrix Spike	Barium (Ba)-Dissolved	MS-B	L1983964-1, -2, -3, -4, -5, -6, -7
Matrix Spike	Boron (B)-Dissolved	MS-B	L1983964-1, -2, -3, -4, -5, -6, -7
Matrix Spike	Sodium (Na)-Dissolved	MS-B	L1983964-1, -2, -3, -4, -5, -6, -7
Matrix Spike	Uranium (U)-Dissolved	MS-B	L1983964-1, -2, -3, -4, -5, -6, -7
Matrix Spike	Zinc (Zn)-Dissolved	MS-B	L1983964-1, -2, -3, -4, -5, -6, -7

Sample Parameter Qualifier key listed:

Qualifier	Description
DLHC	Detection Limit Raised: Dilution required due to high concentration of test analyte(s).
LCS-H	Lab Control Sample recovery was above ALS DQO. Non-detected sample results are considered reliable. Other results, if reported, have been qualified.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
R	The ion abundance ratio(s) did not meet the acceptance criteria. Value is an estimated maximum.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
1,4-DIOXANE-WT	Water	1,4-Dioxane by Headspace GC/MS	SW846 8260

An aliquot of the sample is analyzed directly by headspace technology, followed by GC/MS using isotopic dilution.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

625-511-WT	Water	ABN,CP,PAH-O.Reg 153/04	SW846 8270 (511)

Ground water sample extraction is carried out at a pH <2 (acid extractables) and pH>11 (base neutral extractables). Extracts are dried, concentrated and exchanged into a solvent compatible with the cleanup. Analysis is by GC/MS. Depending on the analytical GC/MS column used benzo(j)fluoranthene may chromatographically co-elute with benzo(b)fluoranthene or benzo(k)fluoranthene.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011), unless a subset of the Analytical Test Group (ATG) has been requested (the Protocol states that all analytes in an ATG must be reported).

CL-IC-N-WT	Water	Chloride by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

CN-WAD-R511-WT	Water	Cyanide (WAD)-O.Reg 153/04	APHA 4500CN I-Weak acid Dist Colorimet

Weak acid dissociable cyanide (WAD) is determined by undergoing a distillation procedure. Cyanide is converted to cyanogen chloride by reacting with chloramine-T, the cyanogen chloride then reacts with a combination of barbituric acid and isonicotinic acid to form a highly colored complex.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

CR-CR6-IC-R511-WT	Water	Hex Chrom-O.Reg 153/04 (July 2011)	EPA 7199

This analysis is carried out using procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846, Method 7199, published by the United States Environmental Protection Agency (EPA). The procedure involves analysis for chromium (VI) by ion chromatography using diphenylcarbazide in a sulphuric acid solution. Chromium (III) is calculated as the difference between the total chromium and the chromium (VI) results.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

DINITROTOL-CALC-WT	Water	ABN-Calculated Parameters	SW846 8270
EC-R511-WT	Water	Conductivity-O.Reg 153/04 (July 2011)	APHA 2510 B

Water samples can be measured directly by immersing the conductivity cell into the sample.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

F1-511-WT	Water	F1-O.Reg 153/04 (July 2011)	MOE DECPH-E3421/CCME TIER 1

Fraction F1 is determined by purging a volume of a ground water sample followed by GC/FID analysis.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

F1-F4-511-CALC-WT	Water	F1-F4 Hydrocarbon Calculated Parameters	CCME CWS-PHC, Pub #1310, Dec 2001-L

Reference Information

Analytical methods used for analysis of CCME Petroleum Hydrocarbons have been validated and comply with the Reference Method for the CWS PHC.

In cases where results for both F4 and F4G are reported, the greater of the two results must be used in any application of the CWS PHC guidelines and the gravimetric heavy hydrocarbons cannot be added to the C6 to C50 hydrocarbons.
In samples where BTEX and F1 were analyzed , F1-BTEX represents a value where the sum of Benzene, Toluene, Ethylbenzene and total Xylenes has been subtracted from F1.

In samples where PAHs, F2 and F3 were analyzed, F2-Naphth represents the result where Naphthalene has been subtracted from F2. F3-PAH represents a result where the sum of Benzo(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Dibenzo(a,h)anthracene, Fluoranthene, Indeno(1,2,3-cd)pyrene, Phenanthrene, and Pyrene has been subtracted from F3.

Unless otherwise qualified, the following quality control criteria have been met for the F1 hydrocarbon range:
1. All extraction and analysis holding times were met.
2. Instrument performance showing response factors for C6 and C10 within 30% of the response factor for toluene.
3. Linearity of gasoline response within 15% throughout the calibration range.

Unless otherwise qualified, the following quality control criteria have been met for the F2-F4 hydrocarbon ranges:
1. All extraction and analysis holding times were met.
2. Instrument performance showing C10, C16 and C34 response factors within 10% of their average.
3. Instrument performance showing the C50 response factor within 30% of the average of the C10, C16 and C34 response factors.
4. Linearity of diesel or motor oil response within 15% throughout the calibration range.

F1-HS-511-WT Water F1-O.Reg 153/04 (July 2011) E3398/CCME TIER 1-HS
Fraction F1 is determined by analyzing by headspace-GC/FID.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011), unless a subset of the Analytical Test Group (ATG) has been requested (the Protocol states that all analytes in an ATG must be reported).

F2-F4-511-WT Water F2-F4-O.Reg 153/04 (July 2011) MOE DECPH-E3398/CCME TIER 1
Petroleum Hydrocarbons (F2-F4 fractions) are extracted from water using a hexane micro-extraction technique. Instrumental analysis is by GC-FID, as per the Reference Method for the Canada-Wide Standard for Petroleum Hydrocarbons in Soil Tier 1 Method, CCME, 2001.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011), unless a subset of the Analytical Test Group (ATG) has been requested (the Protocol states that all analytes in an ATG must be reported).

HG-D-UG/L-CVAA-WT Water Diss. Mercury in Water by CVAAS (ug/L) EPA 1631E (mod)
Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

MET-D-UG/L-MS-WT Water Diss. Metals in Water by ICPMS (ug/L) EPA 200.8
The metal constituents of a non-acidified sample that pass through a membrane filter prior to ICP/MS analysis.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011), unless a subset of the Analytical Test Group (ATG) has been requested (the Protocol states that all analytes in an ATG must be reported).

METHYLNAPS-CALC-WT Water PAH-Calculated Parameters SW846 8270

PAH-511-WT Water PAH-O. Reg 153/04 (July 2011) SW846 3510/8270
Aqueous samples, fortified with surrogates, are extracted using liquid/liquid extraction technique. The sample extracts are concentrated and then analyzed using GC/MS. Depending on the analytical GC/MS column used benzo(j)fluoranthene may chromatographically co-elute with benzo(b)fluoranthene or benzo(k)fluoranthene.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011), unless a subset of the Analytical Test Group (ATG) has been requested (the Protocol states that all analytes in an ATG must be reported).

PH-WT Water pH APHA 4500 H-Electrode
Water samples are analyzed directly by a calibrated pH meter.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011). Holdtime for samples under this regulation is 28 days

VOC-1,3-DCP-CALC-WT Water Regulation 153 VOCs SW8260B/SW8270C

VOC-511-HS-WT Water VOC by GCMS HS O.Reg 153/04 (July 2011) SW846 8260

Reference Information

Liquid samples are analyzed by headspace GC/MSD.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011), unless a subset of the Analytical Test Group (ATG) has been requested (the Protocol states that all analytes in an ATG must be reported).

XYLENES-SUM-CALC-WT	Water	Sum of Xylene Isomer Concentrations	CALCULATION

Total xylenes represents the sum of o-xylene and m&p-xylene.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WT	ALS ENVIRONMENTAL - WATERLOO, ONTARIO, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid weight of sample
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Legend:

Limit	ALS Control Limit (Data Quality Objectives)
DUP	Duplicate
RPD	Relative Percent Difference
N/A	Not Available
LCS	Laboratory Control Sample
SRM	Standard Reference Material
MS	Matrix Spike
MSD	Matrix Spike Duplicate
ADE	Average Desorption Efficiency
MB	Method Blank
IRM	Internal Reference Material
CRM	Certified Reference Material
CCV	Continuing Calibration Verification
CVS	Calibration Verification Standard
LCSD	Laboratory Control Sample Duplicate

Sample Parameter Qualifier Definitions:

Qualifier	Description
J	Duplicate results and limits are expressed in terms of absolute difference.
LCS-H	Lab Control Sample recovery was above ALS DQO. Non-detected sample results are considered reliable. Other results, if reported, have been qualified.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

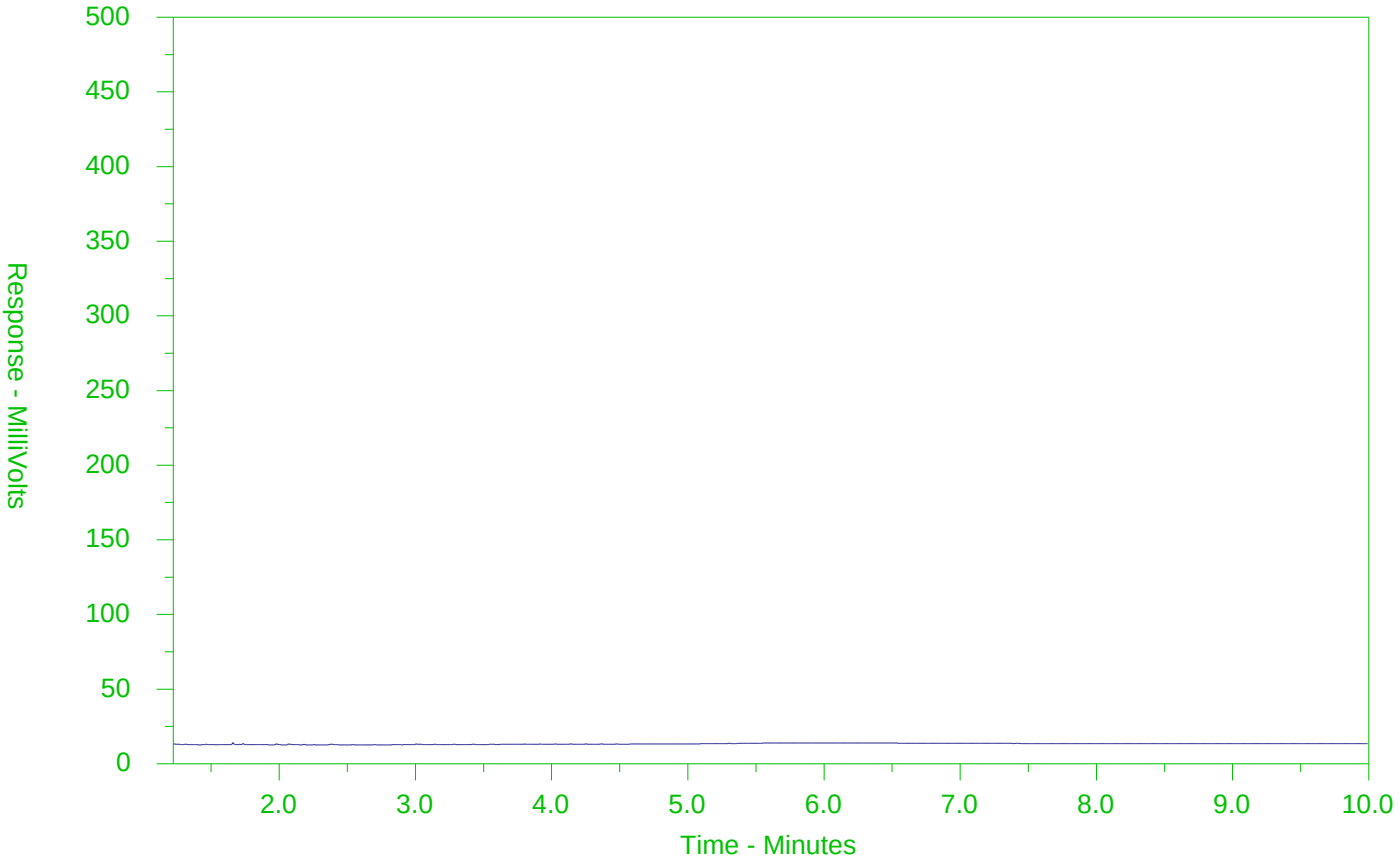
ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

CCME F2-F4 HYDROCARBON DISTRIBUTION REPORT

ALS Sample ID: L1983964-1
Client Sample ID: OW18-11



←F2→	←F3→	←F4→	
nC10	nC16	nC34	nC50
174°C	287°C	481°C	575°C
346°F	549°F	898°F	1067°F
Gasoline →	← Motor Oils/Lube Oils/Grease →		
← Diesel/Jet Fuels →			

The CCME F2-F4 Hydrocarbon Distribution Report (HDR) is intended to assist you in characterizing hydrocarbon products that may be present in your sample.

The scale at the bottom of the chromatogram indicates the approximate retention times of common petroleum products and four n-alkane hydrocarbon marker compounds. Retention times may vary between samples, but general patterns and distributions will remain similar.

Peak heights in this report are a function of the sample concentration, the sample amount extracted, the sample dilution factor and the scale at the left.

Note: This chromatogram was produced using GC conditions that are specific to ALS Canada CCME F2-F4 method. Refer to the ALS Canada CCME F2-F4 Hydrocarbon Library for a collection of chromatograms from common reference samples (fuels, oils, etc.). The HDR Library can be found at www.alsglobal.com.
