Attention:
Jennifer Volpato, District Engineer
Ministry of the Environment, Conservation and Parks
Guelph District Office
1 Stone Road West, 4th Floor
Guelph, ON N1G 4Y2

Project Name: Former IMICO Brownfield
Project Number: 694757

Subject: Compilation of Documents for Tier 3 Risk Assessment No. 6417-B9XQGZ
200 Beverley Street, Guelph, ON

Dear Ms. Volpato,

As requested, the final accepted Tier 3 Risk Assessment (RA) report for the property located at 200 Beverley Street, Guelph and the associated Ministry of the Environment, Conservation and Parks (MECP) correspondence has been attached to this letter as follows:

1. *Risk Assessment for 200 Beverley Street, Guelph, Ontario.* Prepared by Jacobs Engineering Group Inc. for the City of Guelph, Revision 2, dated May 2021

The RA revision was submitted in response to a Notice of Circumstance issued by the MECP dated March 18, 2021. Appendix A4 of the RA (Attachment 1 of this letter) provides the Notice of Circumstance and associated Schedule A.

2. Email RE: *Request for Additional Information - RA for 200 Beverley Street, Guelph, Ontario [RA1748-19c; IDS#6417-B9XQGZ].* From Katherine Appleby, Jacobs Engineering Group Inc., received by TASDB on September 14, 2021, with the following documents attached:
   - IMICO_RA_Sec4-HHRA_14Sept2021
   - IMICO_RA_Fig7-2_AdminReqs_NAPL_14Sept2021

The revised Section 4 contained in Attachment 2 of this letter wholly replaces Section 4 appearing in the RA (Attachment 1 of this letter). Attachment 2 also contains a stand-alone copy of Figure 7-2, which was reported to not be loading property in the compiled RA PDF (Attachment 1 of this letter).

September 22, 2021
Compilation of Documents for Tier 3 Risk Assessment No. 6417-B9XQGZ
200 Beverley Street, Guelph, ON

We trust this document provides the requested documentation of the final accepted MGRA. Please do not hesitate to contact the undersigned if there are any questions.

Yours sincerely

Katherine Appleby, B.E.S., E.P., QPRA
katherine.appleby@jacobs.com

1. Summary of Recommendations and Findings

1.1 Risk Assessment Objectives and Approach

The City of Guelph (City) has retained CH2M HILL Canada Limited (CH2M), now Jacobs Engineering Group Inc. (Jacobs), to provide environmental services for the property identified the former International Malleable Iron Company (IMICO) located at 200 Beverley Street in Guelph, Ontario, hereafter referred to as the "Risk Assessment (RA) Property" or "Site" (Figure 1-1). Jacobs completed a Phase One Environmental Site Assessment (ESA) (CH2M, 2017) and Phase Two ESA investigations (Jacobs, 2020; draft) to support site characterization, development of a conceptual site model (CSM) and RA in advance of redevelopment of the Site to mixed residential and commercial use. Since the previous site land use was industrial/commercial, a change in land use to a more sensitive mixed residential, parkland, and commercial land use requires a Record of Site Condition (RSC) under Section 168.3.1 of the Environmental Protection Act (MECP, 1990).

The RA Property is approximately 5.2 hectares (ha) in size and is located east of the City's downtown. The Site currently consists of vacant land historically used for industrial purposes. All onsite buildings have been razed, with concrete floor slabs still in place (Figure 1-2).

The applicable site condition standards (SCS) are the *Table 6: Generic Site Condition Standards for Shallow Soils in a Potable Groundwater Condition* (Residential/ Parkland/Institutional Property Use) (Table 6 SCS) (MECP, 2011c) since bedrock has been encountered at less than 2 metres below ground surface (mbgs) and the groundwater in the vicinity of the RA Property does and will serve as a raw water supply for a drinking water system.

This RA was prepared in accordance with Ontario Regulation (O. Reg.) 153/04 (MECP, 2011a). Therefore, this RA is based on the principles and guidelines for RAs as described in the Ontario Ministry of the Environment, Parks and Conservation (MECP) documents *Procedures for the Use of Risk Assessment under Part XV.1 of the Environmental Protection Act* (MECP, 2005), together with Schedule C, Table 1 of O. Reg. 153/04 (MECP, 2011a), and the *Rationale for the Development of Soil and Ground Water Standards for Use at Contaminated Sites in Ontario* (Rationale Document) (MECP, 2011b). Additional guidance was also inferred from the *Modified Generic Risk Assessment Model* (MECP, 2016).

The MECP framework for RA is compatible and consistent with the RA frameworks of other agencies, including Health Canada (2010) and the U.S. Environmental Protection Agency (EPA) (1989).

The objectives of the RA are as follows:

- Assess the risk from potential exposure to soil and groundwater to existing and potential future human receptors who may use the RA Property, assuming most of the contaminants of concern (COCs) are managed in place.
- Assess risk to terrestrial ecological receptors from potential exposure to COCs in soil and groundwater at the RA Property.
- Develop Property-specific Standards (PSSs) for COCs in soil and groundwater at the RA Property.
- Develop a risk management plan (RMP) to mitigate or minimize unacceptable risks.

1.2 Deviations from Pre-submission Form

Jacobs submitted the Pre-submission Form (PSF) to the MECP on February 27, 2019, which is provided in Appendix A1. Jacobs received the MECP's review comments on the PSF on May 6, 2019 and the Phase Two conceptual site model (CSM) on October 10, 2019. The MECP comments on the PSF and CSM, and Jacobs response to comments are provided in Appendix A2. The following are deviations from the information provided in the PSF:

- A supplemental soil and groundwater investigation was completed between March and April of 2019; five existing wells were sampled and seven boreholes were advanced. Between February and March 2020, an additional soil and groundwater investigation was completed and 4 boreholes were advanced and 90 monitoring wells were sampled. In February 2020, 5 test pits were also advanced. The results of the additional soil and groundwater sampling are provided in Appendix D3. As a result, the screening tables (Table F1-1 and F1-2) were updated to reflect the additional soil and groundwater data.
- As a result of the additional groundwater monitoring programs, the minimum depth to groundwater remained unchanged, but the average groundwater depth used in the RA (outdoor air pathway) changed to 2.70 mbgs for the Overburden and Bedrock Contact Zone.
- Toxicity reference values (TRVs) and toxicity profiles, when required, were updated to reflect the current MECP toxicity selections and reviewed for updates from other applicable agencies as appropriate. TRVs are presented in Table 4-26 and toxicity profiles are presented in Appendix H of the RA.
- The human health conceptual site model (HHCSM) (Figures 4-1 and 4-2) and ecological conceptual site model (EcoCSM) figures were updated in response to MECP comments (Figures 5-1 and 5-2).
- The Eastern Garter Snake was listed as an aquatic VEC in the PSF in error and has been updated to the Midland Painted Turtle in Section 5 of the RA
- An updated Plan of Survey for the RA Property is provided at the end of Appendix D2.

1.3 Revisions from First Submission of Risk Assessment

Jacobs submitted the RA to MECP on June 19, 2020. The MECP Director's Notice, including comments on the RA, were received on October 16, 2020. Appendix A3 provides the MECP comments on the RA, and Jacobs' responses to the comments. This RA report was revised to incorporate the following changes in response to MECP comments:

- A new subsection (3.2.1) was added to Section 3 to discuss what is known about the NAPL onsite.
- Section 4 was updated to clarify the process for the selection of the COCs to be assessed for trench inhalation; the use of sub-chronic TRVs; the assessment of offsite risks from soil gas migration; the applicability of Sections 41 and 43.1 of O. Reg. 153/04; and the basis for determining whether groundwater COCs are considered mobile or not. Clarifying footnotes were also added to a few tables associated with Section 4 to address specific MECP comments.
- A qualitative assessment of the soil odour pathway was added to Section 4 to support changes made in Section 6 with regards to the development of the Fill Cap Target Concentrations.
- The human health (HH) and ecological conceptual site models (CSM) (Figure 4-1, 4-2, 5-1, and 5-2) were updated to note the presence of NAPL onsite and other minor consistency issues within the HH CSM were corrected.
- Section 5 was updated to acknowledge that reptiles could be present onsite; to qualitatively assess indirect risks to birds and mammals from groundwater via the diet pathway; to clarify the applicability of Sections 41 and 43.1 of O. Reg. 153/04; and acknowledge the potential risks to ecological receptors from contact with petroleum-related NAPL.

- Section 6 was updated to clarify which exposure pathways the Fill Cap Target Concentrations are protective of.
- Section 6 was updated to present rationale related to why NAPL removal is considered technically impractical. Additional edits were made to align the existing discussion with text that was added or modified in other sections of the RA report.
- Section 7 has been revised to include a restriction on the construction of subgrade spaces in areas where NAPL has been observed, unless it can be demonstrated to the MECP that the NAPL has been removed and the groundwater monitoring plan has been updated to include the monitoring of two additional upgradient well nests and three monitoring wells where NAPL has been observed with conditions for triggering notification to the MECP.
- Minor clarifications were made to the text of Section 7 and Appendix I to address MECP comments.
- Minor inconsistencies or typographic errors within the text have been corrected.
- The dates of the mandatory certifications for the RA have been updated to reflect the most recent revision date of the RA (Appendix C).
- Appendix D2 was updated to expand the discussion of the hydrogeological and geological interpretations which differ from the assumptions used in the derivation of the generic standards.
- Appendix D3 was updated to provide clarity with respect to the presence of NAPL in response to reviewer comments.

1.4 Revisions from Second Submission of Risk Assessment

Jacobs submitted the revised RA to MECP on November 17, 2020. The MECP Director's Notice, including comments on the RA, were received on March 18, 2021. Appendix A4 provides the MECP comments on the RA, and Jacobs' responses to the comments. This RA report was revised to incorporate the following changes in response to MECP comments:

- Section 3 was updated to document the previous light nonaqueous phase liquid (LNAPL) recovery efforts that have been conducted at the RA Property.
- Section 4.4.2 was updated to expand the discussion regarding the potential for lateral migration of soil gas offsite from onsite soil sources.
- Bismuth, calcium, iron, and magnesium in soil have been carried through as COCs for the RA Property based on exceedances of the Ontario Typical Range (OTRs) values (or no criteria, in the case of bismuth). The RA was updated as follows to account for the new soil COCs:
    - Appendix D2 - Table 6-7b was updated to remove the removal of the aforementioned analytes as COCs.
    - Appendix D3 - The Phase Two Conceptual Site Model was updated. Jacobs requested new Certificates of Analysis (COAs) reporting the results for these four parameters for all samples analyzed for metals as part of the Phase Two ESA to ensure that adequate Site coverage for delineation purposes was achieved. Results from more than 100 additional samples across the RA Property for each of these COCs were considered in the Phase Two CSM and the RA. The CSM was updated with "Section 1.8.10 – Parameters without MECP Standards", new plan view Figure 6-12 was added to show the results, with Figures 6-12a through 6-12c providing the cross-sections. All the subsequent figure numbers were shifted up by one to account for the new series of figures.

- Appendix D4 - Twelve COAs were replaced with the updated versions.
- Section 3 was updated to reference the change in figure numbers that occurred in Appendix D3.
- The human health risk assessment (Section 4) for soil was updated. Iron was quantitatively assessed, while the other new COCs were qualitatively assessed (Section 4.4.3 and Table 4-39). A toxicity profile for the iron TRV adopted for use in the human health RA has been added to Appendix H.
- The ecological risk assessment (Section 5) for soil was updated for the new COCs. Ecological Benchmark Concentrations (EcoBMCs) were only identified for bismuth for the evaluation of Soil Invertebrates/Plants; the OTRs were adopted as the EcoBMCs for the evaluation of the remaining new COCs for Soil Invertebrates/Plants as well as Birds/Mammals.

- The ecological fill cap targets in Table 5-13 were updated to consider the generic soil leaching to groundwater with discharge to surface water (S-GW3) pathway. These values were subsequently carried through to the overall fill cap targets table (Table 6-3).
- Section 5 was updated to fix inconsistencies in the list of parameters in groundwater that were estimated to result in a potential risk to offsite aquatic receptors.
- Additional supporting information has been provided in Appendix A4 (Figures A4-1 and A4-2) to demonstrate that the use of measured groundwater data at the Site was appropriate to directly evaluate COCs that had concentrations greater than the S-GW3 component values within the ERA.
- Section 7 and Appendix I were revised to remove some references to existing trees that were inadvertently missed being removed during the last RA revision.
- Section 7 and Appendix I were revised to more clearly state where barriers are required across the RA Property following redevelopment (that is, across the entire Site).
- Figure 7-2 has been revised with respect to the inferred extent of area where LNAPL restrictions should apply.
- Appendix D2 (Phase Two Environmental Site Assessment Summary) was updated to expand the discussion regarding assumptions that differed from the MECP in the derivation of the generic standards.
- Table F-1 in Appendix F was revised to provide additional information regarding why tin in soil was not retained as a COC for the RA Property.
- The City received public comments on the RA which were forwarded to Jacobs. The public comments and responses are provided in Appendix J2; Section 8 has been updated to reference the new appendix. The previously provided Public Communication materials remain unaltered as Appendix J1. Changes made in the RA to address the public comments were as follows:
    - A qualitative assessment of the potable groundwater odour pathway was added as Section 4.4.3.10. The results and conclusions of the HHRA remain unchanged, as does the proposed RMMs.

- A qualitative assessment of the soil leaching to potable groundwater pathway was added as Section 4.4.3.11. The results and conclusions of the HHRA remain unchanged, as does the proposed RMMs.
- Section 4.4.6 was revised to fix a discrepancy in the groundwater flow direction wording to be consistent with the Phase Two CSM wording.
- Figures 4-1 and 4-2 were revised to add "residents" to a footnote.

~~1.4~~1.5 Risk Assessment Standards

Table 1-1 presents the PSSs for COCs identified at the RA Property. The COCs broadly include:

- Benzene, toluene, ethylbenzene, and xylenes (BTEX)
- Volatile Organic Compounds (VOCs)
- Metals and inorganics
- Polychlorinated biphenyl (PCB)
- Petroleum hydrocarbons (PHCs)
- Polycyclic aromatic hydrocarbons (PAHs)

Development of PSSs involved considering both human health and ecological receptors that currently exist and that may be present at the RA Property in the future.

~~1.5~~1.6 Risk Assessment Assumptions

The RA was conducted, using the following assumptions:

- The Site currently consists of vacant land historically used for industrial purposes and will be redeveloped to mixed residential, parkland, and commercial use.
- Groundwater is considered potable.
- The soil texture is considered coarse, as defined by O. Reg. 153/04 (as amended).
- The measured groundwater elevations (water table) taken between March 2010 and February 2020 ranged from 311.48 to 314.56 metres above sea level (masl) (0.93 to 4.97 mbgs). The calculated average depth to groundwater is 2.70 mbgs. It is, therefore, assumed that direct contact with groundwater would be limited to subsurface excavations that intercept the groundwater table.
- Subsurface and surface soils are assumed to mix during redevelopment and construction. In the future, subsurface soil could become surface soil and vice versa, so soil data were not segregated into subsurface and surface categories, but were grouped and screened as a single unit.
- Receptors exposed to groundwater could be exposed to COCs observed in groundwater at any depth or from any of the groundwater units identified at the RA Property. Consequently, all units were treated as one unit, and groundwater data sets were aggregated.
- Human receptors are currently present at the RA Property, and may also exist in the future, assuming the potential future land uses mentioned. Consequently, human receptors could be exposed to COCs, and risks were assessed based on future Site conditions, assuming no risk management measures (RMMs) were in place.
- Ecological receptors are currently present and may also exist in the future at constructed ornamental gardens or unmaintained areas. Risks were assessed assuming no RMMs (that is, no clean fill capping layer).

- Exposure events will involve contact with estimated maximum concentrations of COCs, which are estimated based on the observed maximum plus 20 percent (as applied within the MECP Modified Generic Risk Assessment [MGRA] Model [MECP, 2016]), or by applying the method detection limit (MDL).
- Noncancer endpoints for the HHRA assume a maximum target hazard quotient (HQ) of 0.2 for all COCs except PHCs and inhalation of trichloroethylene, which assume a maximum target HQ of 0.5.
- Cancer endpoints for the HHRA assume a maximum target incremental lifetime cancer risk (ILCR) of 1 in 1 million (1×10^{-6}).
- Ecological health endpoints assume a maximum target HQ of 1.0.
- PSSs were based on the site characterization of soil and groundwater. The PSSs were developed based on the estimated Site maximums (Table 1-1). The estimated Site maximums were derived by applying the greater of the maximum detected concentration, multiplying it by 1.2, and then rounding it down to two significant digits, as appropriate, or by applying the MDL.

~~1.6~~1.7 Risk Management Requirements

The following risk management requirements were identified:

- Place clean fill meeting the Fill Cap Target Concentrations (FCTCs) (Section 6) to create fill cap barriers at newly landscaped areas where existing Site soil does not meet the FCTCs, as described in Section 7, for ecological and human health risk management.
- Construct other barriers – such as paving stones, ornamental gardens, concrete, roadways, sidewalks, and buildings—to prevent human receptors' future contact with soil that does not meet FCTCs, as described in Section 7, for ecological and human health risk management.
- Use engineered methods to control vapour intrusion (VI) into future buildings.
- Conduct indoor air and/or subslab vapour monitoring as required to support the design of VI mitigation measures; dependent on a future construction.
- Prohibit the construction of buildings with subgrade spaces in the area of the Site where NAPL has been encountered, unless it can be demonstrated to the MECP that the NAPL has been removed.
- Prohibit the planting of vegetable gardens at the RA Property except in aboveground containers or containerized plots.
- Implement a soil and groundwater management plan (SGMP) for future subsurface work when impacted soil, groundwater, or nonaqueous phase liquid (NAPL) could be encountered.
- Implement a Site-specific health and safety plan (HSP) for workers who may encounter subsurface soil, groundwater, or NAPL during construction activities or maintenance of subsurface utilities.
- Carry out a groundwater and NAPL monitoring program.
- On an ongoing basis, inspect and maintain cap or soil barriers where Site soils do not meet FCTCs to prevent contact with contaminated soils beneath such caps or barriers and erosion; reinstate these caps or soil barriers if subsurface soils are exposed.
- Inspect vapour controls or barriers on an ongoing basis, and maintain these to prevent VI, if required.
- Restrict the construction of single-family freehold dwelling on the RA Property.
- Restrict the use of groundwater from the RA Property as a source of water, either domestic or commercial.

2. Risk Assessment Team Membership

2.1 Environmental Site Assessment

Ed Taves, M.Sc., C.Chem., QPESA, P.Geo. (Limited)

Ed Taves has over 30 years of professional experience in environmental consulting. He specializes in environmental due diligence assessments (Phase One and Two ESAs), site characterization, risk assessment, remedial option analysis, contaminant hydrogeology, facility decommissioning and brownfield redevelopment, and the preparation of Records of Site Condition (RSCs). Clients have included federal and provincial departments and ministries, municipal governments, and private industries, as well as members of the legal, financial, accounting, and land development communities. Projects have been completed for a wide variety of contaminants, including petroleum hydrocarbons, a variety of volatile organic compounds including chlorinated aliphatic hydrocarbons, metals, polychlorinated biphenyls, pesticides, nutrients, energetics, unexploded ordnance, chemical warfare agents, and radiologicals. Ed has fulfilled a number of roles, including project manager, task manager, senior technical consultant, and public and regulatory agency liaison.

Tania McCarthy, B.A.Sc., P.Eng.

Tania McCarthy has over 16 years of experience in environmental services, specializing in Phase I and II and One and Two Environmental Site Assessments (ESAs), contaminated site characterization, remedial investigations, Risk Assessments (RAs), and preparation of Records of Site Condition (RSCs) for various sites in Canada. Her experience also includes fill/soil management plans, solid waste management and landfill gas (LFG) projects within Ontario; and site assessments, remediation, and monitoring reports for projects within the United States (U.S.).

Victoria Peters B.Sc.Env., GIT

Victoria joined Jacobs as a Junior Environmental Scientist in 2017, working in the Federal and Environmental Solutions Group from Jacobs' Kitchener office. Victoria has experience preparing technical reports, including Phase One and Two Environmental Site Assessments (ESAs), sediment characterization technical memorandums, and soil management plans. She also has experience working on remedial excavations and environmental monitoring projects, including soil and groundwater sampling, surface water and sediment sampling, and test pit installation and confirmatory sampling. Victoria has experience with the Ontario Clean Water Act and source water protection and has conducted drinking water threat inventories for a regional municipality.

2.2 Hydrogeology

Jinlong Zang, B.A.Sc., M.Sc., P.Eng.

Jinlong is a hydrogeologist with over 21 years of quantitative and physical hydrogeology experience in:

- ESAs
- Contaminated groundwater evaluation
- Groundwater resources management
- Oil sands mine closure and reclamation
- Mining industry

He specializes in quantitative hydrogeological evaluations and the application of numerical and analytical groundwater simulation tools, which include primarily groundwater flow and contaminant transport modelling at local and regional scales. He has solid experience in hydrogeological investigation for both clean water and contaminated sites, including:

- Hydrogeological baseline studies
- Environmental impact assessments (EIAs)
- ESAs
- Remediation options design and evaluation

He has experience in project management, including:

- Project planning and delivery
- Costing
- Technical reporting
- Liaising with clients, contractors, and regulatory agencies

Alex Biczok, B.A.Sc.

Alex's key roles have included:

- Modelling soil and groundwater contamination
- Interpreting project site hydrogeology
- Analyzing water quality trends
- Carrying out field investigations

He holds a degree in environmental engineering, and his background includes environmental management in the civil services, mining, and energy industries.

2.3 Human Health Risk Assessment

Katherine Appleby, B.E.S., E.P. (QPRA)

Katherine will be the QPRA for this RA. Katherine has 14 years of experience in the field of RAs and ESAs. She has prepared numerous technical reports, including pre-submission forms (PSFs), screening-level risk assessments (SLRAs), and comprehensive RAs. Katherine has experience performing, reviewing, and supervising the completion of both HHRAs and ERAs for land- and water-based sites. Her skills include:

- Developing RA conceptual site models (CSMs)
- Selecting ecological and human health receptors
- Exposure modelling
- Selecting toxicity reference values (TRVs)
- Calculating risk estimates
- Developing risk management measures (RMMs)
- Reporting
- Performing peer review
- Responding to client and regulator comments on RA reports

Katherine has authored, led, or contributed to the completion of over 60 focused, comprehensive, or screening-level RA reports using both provincial (Ministry and Environment Yukon) and federal (Health Canada and Canadian Council of Minister of the Environment [CCME]) frameworks. She is familiar with provincial and federal environmental legislation, such as O. Reg. 153/04 (as amended) and the RSC filing process.

Brandi Wilson, B.Sc.

Brandi Wilson is an Environmental Scientist with 4 years of experience in the environmental consulting industry. Her areas of expertise include environmental assessments, including conducting HHRAs and Phase One ESAs; data entry and processing; writing technical memoranda; and performing field investigation activities, including sediment and groundwater sampling. She has prepared numerous technical reports, including PSFs, SLRAs, and comprehensive RAs. Her skills include developing exposure modelling, calculating risk estimates, reporting, and responding to client and regulator comments on RA reports. Brandi also has experience with stormwater management (SWM) pond sediment chemistry related disposal versus beneficial use evaluations.

2.4 Ecological Risk Assessment

Katherine Appleby, B.E.S., E.P. (QPRA)

Katherine will be the QPRA for this RA. Katherine has 14 years of experience in the field of RAs and ESAs. She has prepared numerous technical reports, including pre-submission forms (PSFs), screening-level risk assessments (SLRAs), and comprehensive RAs. Katherine has experience performing, reviewing, and supervising the completion of both HHRAs and ERAs for land- and water-based sites. Her skills include:

- Developing RA conceptual site models (CSMs)
- Selecting ecological and human health receptors
- Exposure modelling
- Selecting toxicity reference values (TRVs)
- Calculating risk estimates
- Developing risk management measures (RMMs)
- Reporting
- Performing peer review
- Responding to client and regulator comments on RA reports

Katherine has authored, led, or contributed to the completion of over 60 focused, comprehensive, or screening-level RA reports using both provincial (Ministry and Environment Yukon) and federal (Health Canada and Canadian Council of Minister of the Environment [CCME]) frameworks. She is familiar with provincial and federal environmental legislation, such as O. Reg. 153/04 (as amended) and the RSC filing process.

Jennifer Mannisto, B.Sc.

Jennifer Mannisto is an Environmental Scientist with 2 years of experience in the environmental consulting industry. Her areas of expertise include environmental assessments, including conducting HHRAs, ERAs, and Phase One ESAs; data entry and processing; client communication; and writing technical memoranda. She has prepared numerous technical reports including PSFs, SMPs, and comprehensive RAs, and has written Phase I/One ESAs in Ontario, British Columbia, and Alberta. Her skills include calculating risk estimates, reporting, and data management. She is familiar with provincial and federal environmental legislation, such as O. Reg. 153/04 (as amended) and the RSC filing process.

2.5 Engineering

Jennifer Caron, P.Eng., QPRA

As a project engineer with over 25 years' experience in environmental consulting, Jennifer Caron has been involved in the management and execution of groundwater and soil cleanup programs for a variety of industrial and municipal clients. She has extensive experience in contaminant hydrogeology and site characterization, and has over 20 years of experience with RA projects. Her role in RA projects during the past 15 years has been primarily as lead risk assessor responsible for completing the majority of the RA reports, including the conceptual site model (CSM); the modelling, exposure,risk characterization calculations; the evaluation of existing site data; and risk management.

Jennifer's experience has been with a variety of organic and inorganic chemicals, including extensive experience in assessing the fate and transport of chlorinated organic compounds.

Travis Tan, M.A.Sc., P.Eng., QPESA, QPRA

Travis has over 11 years of experience in the environmental field, specializing in providing solutions for brownfield redevelopment, including risk assessment, risk management, and remediation.

Travis is a Qualified Person for ESA (QPESA) as defined by O. Reg. 153/04. He has managed and provided senior technical oversight on ESA work for more than 100 sites across Ontario and Alberta. These sites include a 69-hectare (ha) (170-acre) former power plant, an operating aircraft manufacturing facility, a 101-ha (250-acre) former chemical manufacturing plant, a 36-ha (90-acre) former wood treatment plant, and retail gasoline stations.

Travis has extensive experience in providing solutions for brownfield redevelopment and management of environmental liability. He has been involved in planning and managing risk assessments, including risk management plans (RMPs), and environmental remediation for complex brownfield sites. As a Qualified Person for RA (QPRA) as defined by O. Reg. 153/04, Travis has worked on approximately 30 risk assessments (RAs) on sites across Ontario, of which 15 have been accepted by the Ministry and Records of Site Condition (RSCs) were subsequently filed.

Travis has provided due diligence consultation on numerous property transactions, including one valued at more than $200 million. He has also provided technical support for some of the top environmental attorneys in Ontario, and served as expert witness on environmental litigation.

Travis holds a Bachelor of Engineering degree in Environmental Engineering from the National University of Singapore and a Master of Applied Science degree in Chemical Engineering from the University of Toronto. He is a registered Professional Engineer in Ontario and Alberta.

3. Property Information, Site Plan, and Geological Interpretation

Additional supporting documentation and interpretation for the information included in this section is provided in Appendix D.

3.1 Property Information

3.1.1 Risk Assessment Property Location and Ownership

The Risk Assessment Property (RA Property or Site) is located at 200 Beverley Street in Guelph, Ontario (Figure 1-1). The current land use is industrial, and the proposed future land use may include residential, parkland, and commercial uses. The Universal Transverse Mercator (UTM) coordinates (North American Datum [NAD] 83, Zone 17) for the RA Property are 562213 Easting (E) and 4822326 Northing (N).

The City of Guelph (City) is the current owner of the RA Property. Table 3-1 presents the property information for the RA Property. Table 3-2 presents the current owner contact information related to the RA Property.

3.1.2 Physical Characteristics of Risk Assessment Property

The RA Property (Figure 1-1), is approximately 5.2 hectares (ha) in area, and roughly triangular in shape. The Site currently consists of vacant land historically used for industrial purposes. All onsite buildings have been razed, with concrete floor slabs still in place. The RA Property is surfaced with vegetation where concrete floor slabs are not present (Figure 1-2).

No surface water features were identified onsite or within 30 m of the RA Property. The nearest surface water features are the Eramosa River (0.5 kilometres [km] south), and the Speed River (1.1 km west).

The Site lies at an average elevation of approximately 315.5 metres above sea level (masl), with a topographic high of approximately 316.5 masl at OW13, which lies in the southeastern portion of the Site. The final grading and drainage of the RA Property under redevelopment conditions are yet to be determined, but it is anticipated that drainage will be directed toward the City's stormwater system. This decision will be made as part of the redevelopment activities.

3.1.3 Additional Property Information

The following subsections summarize additional property information which Jacobs used in the development of the conceptual site model and supported the preparation of the RA report.

3.1.3.1 Site History and Past Uses

The Phase One ESA (CH2M, 2017) provides the history of the RA Property, summarized herein.

Based on a review of available information, the RA Property was considered to be first developed in 1913 when it was acquired by the International Malleable Iron Company (IMICO) for use as an iron-jobbing foundry. Historical onsite buildings/structures and manufacturing areas were identified from fire insurance plans (FIPs) and site plans in previous reports, including the foundry, annealing room, chipping room, galvanizing buildings, warehousing, storage (coal, sand, bricks, polychlorinated biphenyl [PCB] materials), paint shop, and offices.

The foundry closed in 1989, and the Site was generally vacant from that time on, with the exception of some reported community-type occupancy during the time of the Assembly of the Church of the Universe ownership (1993 to 1997). A number of fires occurred during this period, and in 1997, the City took over the Site. Demolition of the buildings and removal of various wastes from the Site (including some excavated soil and PCB materials and a large above-ground storage tank [AST]) occurred in 1998 through 1999.

3.1.3.2 Current Site Use

Currently, the RA Property is currently vacant with no onsite operations occurring. No buildings or structures are located onsite; however, the majority of the concrete floors, foundations, and footings of historical buildings were present at the time of the site reconnaissance (June 21 and 29, 2017). The RA Property is considered an industrial/commercial/community land use under O. Reg. 153/04. Since the historical land use has been predominantly industrial, and the future land use is mixed residential, parkland, and commercial use, the RA Property requires a record of Site Conditions (RSC) for a change to a more sensitive land use under Section 168.3.1 of the *Environmental Protection Act* (MECP, 1990).

3.1.3.3 Current and Past Use of Adjacent Properties

The RA Property is surrounded by a mix of industrial, commercial, and residential lands. The RA Property is bound:

- To the north by residential, commercial, and industrial properties
- To the east by residential, commercial, and industrial properties
- To the west, bounded by Stephenson Street South and beyond that are residential and commercial properties
- To the south, bounded by Beverley Street and beyond that are residential, commercial, and industrial properties

Figure 1-2 provides an aerial view of the RA Property and the current land use of the adjacent properties.

3.1.3.4 Potential Offsite Sources of Contamination

The Phase One ESA (CH2M, 2017) identified the following offsite potentially contaminating activities (PCAs) within the Phase One Study Area (that is, the area within 250 m of the Eastern Site):

- 8 – Chemical Manufacturing, Processing, and Bulk Storage
- 10 – Commercial Autobody Shops
- 11 – Commercial Trucking and Container Terminals
- 12 – Concrete, Cement and Lime Manufacturing
- 27 – Garages and Maintenance and Repair of Railcars, Marine Vehicles, and Aviation Vehicles
- 28 – Gasoline and Associated Products Storage in Fixed Tanks
- 33 – Metal Treatment, Coating, Plating and Finishing
- 34 – Metal Fabrication
- 39 – Paints Manufacturing, Processing or Bulk Storage
- 43 – Plastics (including Fiberglass) Manufacturing and Processing
- 45 – Pulp, Paper and Paperboard Manufacturing and Processing
- 46 – Rail Yard, Tracks, and Spurs
- 49 – Salvage Yard, including Automobile Wrecking
- 55 – Transformer Manufacturing, Processing and Use
- 57 – Vehicles and Associated Parts Manufacturing

3.1.3.5 Potential Offsite Receptors

The current land use immediately surrounding the RA Property is residential and industrial/commercial. Therefore, offsite human receptors include residents, patrons, and workers at nearby homes, businesses, or facilities. The land use surrounding the RA Property in the future is unknown, but the human receptors inferred to be present under current conditions are likely to also be present under future conditions.

Given that the surrounding land uses are urban and developed, offsite terrestrial ecological receptors are anticipated to include mowed grass, trees, shrubs, and herbaceous vegetation in constructed ornamental gardens as well as mammals and birds tolerant of habitat disturbances and human activities within an urban setting, as well as species with a greater range, which migrate between habitats and areas. No surface water features are located on or in the immediate vicinity of the RA Property where aquatic ecological receptors may reside. The closest water body is the Eramosa River located approximately 500 m to the south.

3.1.3.6 Proposed Future Site Use

The future redevelopment plans at this time are unknown, but may include one or more of residential, parkland, and commercial use.

3.2 Site Plan and Hydrogeological Interpretation of RA Property

Exhibit 3-1 provides a summary of the Phase Two Conceptual Site Model (CSM) that was relied upon in the preparation of the RA. Appendix D3 provides the full Phase Two CSM, which satisfies the mandatory reporting requirements for this subsection of the RA report.

Exhibit 3-1. Phase Two Conceptual Site Model Summary

Phase Two CSM Element	Summary	Figure Reference (Appendix D3)
Potentially Contaminating Activities (PCA)	• 77 PCAs identified, 48 offsite and 29 onsite	4-1a and 4-1b
Areas of Potential Environmental Concern (APEC)	• 33 APECs identified, 4 attributable to offsite PCAs and 29 attributable to onsite PCAs	4-2
Subsurface Structures and Utilities	• Some concrete foundations, slabs and footings from the former buildings remain onsite • Although utilities have been disconnected on Site, piping and bedding have not been removed and, therefore, there is a potential for utility corridors to act as preferential route of contaminant. The locations of former utilitiy corridors are not known	2-2

Stratigraphy	From the surface:
	• Fill
	• Sily fine sand
	• Eramosa Formation
	  o Stone Road Member
	  o Reformatory Quarry Member
	  o Vinemount Member
	• Goat Island Formation
		6-1, 6-1a to 6-1h

Exhibit 3-1. Phase Two Conceptual Site Model Summary

Phase Two CSM Element	Summary	Figure Reference (Appendix D3)
Hydrogeological Characteristics		
Overburden and bedrock contact zone	• Flow Direction: Northeast to southwest • Average Hydraulic Conductivity: 3.9 x 10^{-5} m/s • Horizontal Hydraulic Gradients: 0.002 to 0.019 m/m • Groundwater Velocity: 25 to 230 m/y • Vertical Hydraulic Gradients: Predominantly downward ranging in magnitude from 0.001 to 0.17 m/m	6-2a, 6-2b, 6-2c
Eramosa Formation	• Flow Direction: East • Average Hydraulic Conductivity: 5.7 x 10^{-7} m/s • Horizontal Hydraulic Gradients: 0.0004 and 0.002 m/m • Groundwater Velocity: 0.7 to 3.5 m/y	6-2d, 6-2e, 6-2f
Goat Island Formation	• Flow Direction: Not available • Average Hydraulic Conductivity: 3.7 x 10^{-5} m/s • Horizontal Hydraulic Gradients: Not available • Groundwater Velocity: Not available	NA
Depth to Bedrock	• 1.0 to 3.4 mbgs	6-1a to 6-1h
Depth to Water Table	• Minimum: 0.93 mbgs • Average: 2.78 mbgs • Maximum: 4.97 mbgs	6-1a to 6-1h
Applicablility of Sections 35, 41, or 43.1	• Section 43.1 applies (shallow soils) • Section 35 and 41 are not applicable • Table 6 selected as the SCS (MECP, 2011b)	NA
Areas where Soil has been Brought to the RA Property	• Historical fill present, no soil brought to the RA Property as part of the Phase Two ESA	NA
Proposed Building Locations	• Final redevelopment plans are unknown, potential future residential or commercial buildings	NA
Contaminants in Soil	• Metals (sitewide, delineated to bedrock) • EC (northeast corner in backfill material from previous excavation completed by others) • BTEX (localized in two areas: western boundary and south-central portion, delineated to bedrock) • PHCs (localized to three areas: western area and central-southern area, and northeastern and eastern area, delineated to bedrock) • PAHs (localized to four areas: western boundary, south-central area, northern boundary, and eastern area, delineated to bedrock in most areas) • VOCs (localized to the eastern corner, delineated to bedrock) • PCBs (localized to three areas: eastern area, western area, and south-central area, delineated to bedrock in all areas but the eastern area)	6-3 through 6-~~11~~12

Exhibit 3-1. Phase Two Conceptual Site Model Summary

Phase Two CSM Element	Summary	Figure Reference (Appendix D3)
Contaminants in Groundwater	• Metals (in overburden and bedrock contact zone and Eramosa Formation) • BTEX (in overburden and bedrock contact zone and Eramosa Formation) • PHCs ((in overburden and bedrock contact zone); LNAPL measured in three monitoring wells in the eastern portion of the Site. • PAHs (in overburden and bedrock contact zone) • VOCs (in overburden and bedrock contact zone, Eramosa Formation, and Goat Island Formation)	6-~~12~~ 13 through 6-~~20~~21
Climatic Conditions	• Temporal flucations in groundwater levels. No atypical weather events that would be expected to significantly influence COC transport are known to have occurred during the Phase Two ESA	NA
Vapour Intrusion	• Details regarding the location or construction details of future buildings, or where subsurface utilities will be installed are not known at this time. RMMs for future buildings are required, as discussed in Section 7.	NA
Human Health Conceptual Site Model	• Residents, site visitors, outdoor workers, construction workers, and utility workers in contact with soil and groundwater, via direct contact, dust inhalation, and inhalation of outdoor air	4-1 (main text)
Ecological Conceptual Site Model	• Soil organisms, terrestrial plants, birds, and mammals in contact with soil (groundwater for terrestrial plants only) via direct contact, root uptake (plants), and ingestion (of biota and prey)	5-1 (main text)

Notes:
cm/y = centimeters per year
COC = contaminant of concern
m/m = metres per metre
m/s = metres per second
m/y = metres per year
mbgs = metres below ground surface
NA = not applicable
LNAPL = light nonaqueous phase liquid
SCS = site condition standard

3.2.1 Presence of Light Non-Aqueous Phase Liguid

LNAPL was measured in the eastern portion of the Site, at OW23S, MW17-108S, and MW18-135S, with apparent thicknesses measurements within the wells of up to 0.970 m. These LNAPL measurements within the wells have shown significant variation (that is, reported thicknesses as low as <0.005 m in the same well after a measurement with a greater measured thickness). The variability in the LNAPL measurements are subject to the Site conditions and field methods at the time of the measurement and to water table fluctuations and LNAPL accumulations that occur in the monitoring wells during periods of water table decline. Generally, the apparent LNAPL thickness measured in a monitoring well can be between 2 to 10 times greater than that in the formation (USEPA, 1995). The measured apparent LNAPL thicknesses at the three monitoring wells are provided below:

Well ID	LNAPL Thickness (m)							
	12/1/2017	8/20/2018	12/18/2018	3/26/2019	7/3/2019	10/1/2019	12/3/2019	2/21/2020
OW23S	0.010	0.390	<0.005	--	0.020	0.500	0.970	<0.005
MW17-108S	0.000	0.130	<0.001	0.130	0.040	0.180	0.070	<0.001
MW18-135S	--	--	--	0.010	0.930	0.560	0.750	0.020

The source of the LNAPL is likely related to the historical contamination in the northeastern area of the Site which was remediated (soils excavated to bedrock) in 1998. In the central eastern portion and southeast corner of the Site, the concrete building slabs from the former machine shop and warehouse/storage buildings remain intact, further suggesting the source is from a release to the north. Historical LNAPL has been consistently measured in OW23 since monitoring began after the remediation. Groundwater montoring programs, completed as part of the 2004 Provincial Officer's Order (Order Number 7616-5LA:3S), had been conducted by AECOM since 1998 which included the collection of groundwater samples, recording of water level measurements, and the removal of LNAPL at OW23S (AECOM, 2015). The quantities of LNAPL removed were only specified in the 2015 and 2016 reports which indicated only recoveries ranging from 100 millilitres (mL) to 350 mL from each event (AECOM, 2016, 2017). LNAPL thickness measurements at OW23S stayed relatively stable over those years and indication from City representatives confirmed very little LNAPL was recovered in these efforts.~~, in 2004, with a~~Apparent thicknesses were reported between 0.02 to 0.15 m in 2004 (Gartner Lee Limited, 2004) and~~;~~ between 0.02 to 0.15 m from 2010 to 2016 (AECOM, 2012-2017)[1]; measurements collected from 2017 to present are shown above. MW17-108S and MW18-135S were installed in 2017 and 2018 for delineation purposes, and LNAPL has been measured in these additional wells from this time onward. The limits of the LNAPL are inferred based on surrounding wells to the north, east, south and west, with screens straddling the water table, and no measured LNAPL: OW22S, OW13-39S, MW19-137S, OW09-I, and MW17-101S.

Based on the monitoring network, the LNAPL appears to remain within the property boundaries, and prior to advancing additional wells in the area, LNAPL had historically been measured only in the one monitoring well (OW23). The release of contaminants would have occurred sometime prior to the 1998 excavation, indicating that in over 20 years, potential migration has been limited. The LNAPL/water levels measured from 2010 to 2020 show levels fluctuating around the bedrock contact zone in the northern end, and consistently below the bedrock surface in the southern portion of the inferred plume. Stratigraphic logs for the monitoring wells advanced in the area have indicated black staining, sheen, and hydrocarbon odours in the highly fractured bedrock (that is, up to 4.6 mbgs at MW17-108S). Based on this information, active LNAPL extraction was determined ~~is~~to not be feasible as the process would be slow and inefficient within the bedrock, and would involve very costly measures.

The dissolved concentrations of PHCs in the groundwater where LNAPL is present are mainly comprised of F3 fractions, with concentrations of up to 580,000 µg/L (F3), 13,000 µg/L (F2), and 24,000 µg/L (F4) reported at the north end of the inferred plume. The most recent sampling of monitoring wells wth LNAPL had groundwater samples collected immediately below the LNAPL (using special sampling techniques) with reported dissolved concentrations of up to 7,360 µg/L (F3) and 550 µg/L (F4).

The NAPL locations (along with the PHC results in groundwater) are discussed in Appendix D3 as part of the Phase Two ESA Conceptual Site Model (CSM), and shown on Figure 6-15 (plan view) and in cross-section view on Figures 6-15a and 6-15b.

3.2.2 Non-Standard Delineation

Under the assumption that the RA will be accepted by the MECP, non-standard delineation per O. Reg. 153/04 Schedule E, Section 7.1 was conducted for the following contaminants of concern (COCs):

- cis-1,2-dichloroethylene (cis-1,2-DCE) in groundwater at OW31 (refer to Figures 6-17, 6-17c and 6-17d in Appendix D3).

[1] Reports made available as part of the background review for the Phase One Environmental Site Assessment.

Delineation was conducted to the requirements of O. Reg. 153/04 Schedule E, Section 7 for all other COCs identified at the RA Property in soil and groundwater.

There is confidence that the maximum concentration of cis-1,2-DCE onsite has been located (OW24D) given its proximity to the known offsite source of chloroethenes and the consistently lower concentrations found across the remainder of the Site, decreasing both horizontally and vertically. Low levels of cis-1,2-DCE are present at depths on Site greater than the depth of OW24D, however the low level cis-1,2-DCE is present across the entire Site in the Goat Island and the Vinemount Member, interpreted to be from an upgradient offsite source based on regional data. Additional vertical or lateral delineation of cis-1,2-DCE at the Site would not materially change Phase Two ESA Conceptual Site Model (CSM), or the Risk Management measures (RMM) to be developed as part of the RA based on the existing dataset. We understand that the MECP concurs with this interpretation, as well as agrees on the importance to avoid drilling deeper into the City's municipal drinking water aquifer, the Gasport Formation. Based on this information, the QP is satisfied that the current dataset provides adequate information to support the RA and additional vertical delineation is not required.

3.3 Contaminants of Concern

The list of COCs for initial consideration in both the human health risk assessment (HHRA) and ecological risk assessment (ERA) was determined according to the screening process described in the following subsections. The major tasks involved for COC selection are as follows:

- Identification of sampling data available for the RA Property
- Review of the suitability of the data in terms of reliability and representativeness of current Site conditions (consistent with the Phase Two ESA)
- Identification of maximum contaminant concentrations and comparison to the applicable SCS (or other appropriate screening criteria for chemicals not regulated under O. Reg. 153/04).

3.3.1 Identification of Data Sources

The RA Property has been the subject of several soil and groundwater investigations and studies since 1991. Appendix D1 (Table D1-2) provides the list of historical reports and investigations. Jacobs reviewed the analytical data results from past investigations to provide a summary of the known soil and groundwater quality within the RA Property as part of the Phase One ESA (CH2M, 2017). COCs for the RA Property were identified based on analytical results obtained from the current Phase Two ESA in addition to staged sampling programs that have been implemented by a variety of consultants.

3.3.2 Reliability of Historical Data

Jacobs evaluated historical data collected by others as part of the data gap assessment and sampling and analysis plan development, to determine whether they could be applied during the Phase Two ESA (in development by Jacobs).

In general, Jacobs made the following observations during this evaluation:

- Parameters, such as oil and grease, total petroleum hydrocarbons (TPHs), and volatile organic compounds (VOCs) were characterized more adequately by current standards, using appropriate sample collection and laboratory analysis methods. Oil and grease and TPH analyses were replaced by petroleum hydrocarbon (PHC) fraction (F)1 through F4 analysis. TPH and VOC analyses from before 2004 are considered unreliable due to changes in analytical methods

- Groundwater concentrations older than 10 years from the commencement of the Phase Two ESA activities were considered not representative of current conditions
- Some results (specifically those prior to 1999) were provided in some reports without supporting laboratory certificates of analysis (COAs)

Where these observations were noted, a portion of the historical data could not be fully relied upon to reflect current environmental conditions at the RA Property. Therefore, Jacobs used the data for screening purposes only during the Phase Two ESA to reflect the possible presence of contaminants in certain areas. The data was not used to confirm concentrations meeting the applicable standards in APECs, nor were they used to confirm maximum concentrations on the RA Property.

The following historical data in soil were determined to be adequate for identifying contaminant concentrations:

- Metals, including hydride forming and ORP hexavalent chromium and mercury
- Polycyclic aromatic hydrocarbons (PAHs)
- Polychlorinated biphenyls (PCBs)
- VOCs and BTEX after 2004

PAHs and PCBs are less likely to degrade in the field. However, current analytical methods for these parameters have lower detection limits, and therefore, they are better used for defining limits and extents of contamination relative to current standards. Where older method detection limits (MDLs) may have been exceeded, additional analysis may be required to confirm maximum concentrations, or to confirm concentrations are less than applied standards. Jacobs considered this requirement while developing the various sampling and analysis plans for the Phase Two ESA (in development by Jacobs). Minimal degradation of metals in soil is expected over time; therefore, data are inferred to reasonably reflect RA Property conditions, except in areas inferred to have been further contaminated since initially sampled which has not known to occur at the Site.

Note that where historical data were used for the parameters, results should be interpreted with caution. Over time, regulations, analytical best practices, and methods have evolved. Many hold times and preservatives changed as a result of O. Reg. 153/04 (MECP, 2011c). Changes in analytical methods, hold times, and sample preservation do not necessarily invalidate previous data, but they keep the analytical procedures in step with current science. Most preservatives and hold times are designed to retain analytes of interest in solution for the period of the stated hold time. It is reasonable to state that as hold times and preservatives are changed with the use of new analytical best practices, older data could be biased low; however, this is not necessarily always the case. Moreover, changes in current rules affecting sample preservatives and hold times do not invalidate the usability of historical data.

Despite these considerations, the historical soil and groundwater data deemed adequate for identifying contaminant concentrations were considered valid for ESA, remedial planning, and RA purposes for the following reasons:

- Changes in current rules affecting sample preservatives and hold times do not invalidate the usability of historical data. Over time, regulations, analytical best practices, and methods have evolved.
- Samples were analyzed at commercial laboratories, using standardized methods for environmental sampling. Commercial laboratories have the ultimate goal of producing valid and reproducible data by performing analysis using current reference methods, often issued by the United States (U.S.) Environmental Protection Agency (EPA) or MECP.

- More recent data have lesser detection limits; however, this is accounted for in the data evaluation. The testing at commercial laboratories has, for the most part, been conducted for years, and the evolution of the testing methods has improved the performance of the method but has not invalidated previous data.
- In general, changes to MDLs will not change the absolute values determined; however, there will be more detections as the detection limits are reduced.

3.3.3 Additional Phase Two Environmental Site Assessment Data Screening Summary

A review of the database as part of the Phase Two ESA (Jacobs, 2020) indicated that select nondetected soil and groundwater results for specific parameters based on laboratory MDLs greater than the Table 6 SCS may not be representative of site conditions. Additionally, parameters that were run as part of older ABN laboratory scans alongside VOCs and PAHs, that were not targeted COCs may not be representative of Site conditions, At the discretion of the QP_{ESA} for the RA Property, these data points, with some exceptions, have been excluded from the analytical database following a rigorous data review process. In general, removal of the select elevated MDL data had a negligible impact on the identification of COCs. The MDL data points removed represent a small proportion of the total data set for soil or groundwater. The rationale for the removal of each of the data points is presented in Appendix D2, Tables 6-7b (soil) and 6-10b (groundwater).

At the discretion of the QP_{ESA} for the RA Property, parameters with exceedances that were not reproduced in subsequent sampling events were not considered groundwater COCs. The rationale for the removal of each of the data points is presented in Appendix D3, Table 6-10c.

3.3.4 Contaminant of Concern Screening Process

Follwing the steps previously described, Jacobs conducted the screening for COCs as follows:

1. A maximum concentration was identified for each parameter. The maximum concentration in soil and groundwater was determined as either the maximum measured value or the greatest detection limit (if greater than the maximum measured value) if an MDL was retained based on the additional data screening per Section 3.3.3.
2. Parameters were retained as a COC under the screening process if they were detected in soil, groundwater, or both as follows:
    a. Parameters were retained for further consideration under the screening process for soil and groundwater if the identified maximum concentration exceeded the Table 6 SCS. Tables F1-1 and F1-2 in Appendix F show the detailed screening process, including the measured concentrations, the number of samples, and the number of detects greater than the Table 6 SCS in soil and groundwater, respectively, at the RA Property.
    b. Parameters that did not have a Table 6 SCS for the media sampled, and where 100 percent of the samples were nondetect, were not retained as COCs (Tables F1-1 and F1-2). There is high confidence that these parameters are not present onsite. However, parameters with laboratory analysis of onsite sampling that reported detectable results were further considered per Section 3.3.3.

    A number of additional screening considerations were built into Step 2 of the screening process on a parameter-specific basis. Of note are the following considerations:

i. Analytical results for the following parameters were reviewed to confirm that the sum of maximum reported individual isomers or the reported summed total was selected as the overall maximum value for comparison to the applicable SCS:

- Methylnaphthalene 2-(1-), 1-methylnaphthalene, and 2-methylnaphthalene
- Benzo(b&j)fluoranthene, benzo(b)fluoranthene, and benzo(j)fluoranthene
- Total xylenes, o-xylene, and m,p-xylene
- 1,3-Dichloropropene, cis-1,3-dichloropropene, and trans-1,3-dichloropropene
- 2,4- and 2,6-Dinitrotoluene, 2,4-dinitrotoluene, and 2,6-dinitrotoluene
- PHC F1, PHC F1 [minus BTEX]
- PHC F2, PHC F2 [minus naphthalene]
- PHC F3, PHC F3 [minus PAHs]
- PHC F4, F4 gravimetric (F4G)-silica gel (SG) (gravimetric-heavy hydrocarbon-silica)

3.3.5 Contaminant of Concern Screening Results

3.3.5.1 Soil

As Table 4-1 indicates, ~~38~~ 42 COCs were retained in soil following the screening process outlined in Section 3.3.4 (Screening Step 2). These chemicals were carried through to the HHRA and ERA. Appendix F presents the detailed screening tables.

3.3.5.2 Groundwater

As Table 4-2 indicates, 30 COCs were retained in groundwater after screening process outlined in Section 3.3.4 (Screening Step 2). These chemicals were carried through to the HHRA and ERA. Appendix F presents the detailed screening tables.

3.3.5.3 Sampling Programs

The Phase Two ESA investigation (summarized in Appendix D2) was conducted to:

- Support and update previous studies
- Meet current O. Reg. 153/04 (as amended) (MECP, 2011a) regulatory requirements
- Investigate or further investigate APECs identified during the Phase One ESA (summarized in Appendix D1)
- Provide data to support future remedial activities or an RA that would need to be conducted to support the eventual filing of an RSC

The sampling program which consisted of a comprehensive soil and groundwater sampling program is considered sufficient to meet the objectives of the RA (refer to Section 1.1). The Site characterization, which describes the stratigraphy and hydrogeological characteristics of the Site, informed the selection of potential human and ecological receptors both on and off the RA Property. The horizontal and vertical extent of impacts in both soil and groundater have been sufficiently defined for the Site, providing confidence that the maximum concentrations of COCs have been identified. The maximum concentrations were used to derive exposure point concentrations for the evaluation of human and ecological health risks and to derive a property-specific standards for each COC. Since the intent is to manage the potential risk associated with soil and groundwater contamination in place by using engineering controls as necessary (Section 7), the data collected by Jacobs was considered to be adequate.

4. Human Health Risk Assessment

This section of the risk assessment (RA) primarily evaluates risk to human health at the RA Property by addressing the elements required in the RA process. Jacobs completed a quantitative and qualitative Human Health Risk Assessment (HHRA) and deemed the level of risk to be appropriate based on the RA Property's existing conditions and anticipated future use, and the implementation of a risk management plan (RMP). HHRAs assess the potential for human health risks resulting from contamination and the presence of contaminants of concern (COCs) at a site.

This HHRA adheres to the prescribed Ontario Regulation (O. Reg.) 153/04 (as amended) (MECP, 2011a) reporting format and includes the following four major elements:

1) Problem Formulation
2) Exposure Assessment
3) Hazard Assessment
4) Risk Characterization

4.1 Problem Formulation

4.1.1 Human Health Conceptual Site Model

The previously identified risk components, namely chemicals detected, site-specific soil characteristics, pathways, and receptors, as well as proposed redevelopment conditions, are combined to synthesize the conceptual site model (CSM) for the HHRA. The CSM is used to direct the quantitative and qualitative assessments to complete the RA. This section describes elements considered in the development of the CSM.

Receptors have been identified under pre- and post-redevelopment situations, independent of the screening of COCs. This is so that the most conservative scenarios for the RA Property are considered and modelled quantitatively, if necessary. Jacobs understands the RA Property will be redeveloped into mixed residential, parkland, and commercial use. Consequently, Jacobs considered residential and commercial development scenarios while identifying receptors and potentially complete exposure pathways. Residential exposures are protective of parkland exposures.

The following onsite receptor types have been identified for the CSM:

- Residents
- Site Visitors
- Indoor Workers
- Construction Workers
- Utility Workers
- Outdoor Workers

Offsite potential receptors include the following:

- Surface Receptors[1]
- Construction Workers
- Utility Workers

[1] Surface Receptors incorporate offsite surface receptors (that is, receptors not engaged in subsurface excavation activities), such as Residents, Visitors, Outdoor Workers, or Patrons of nearby properties who may be exposed to dust (soil particulates) migrating offsite during the redevelopment of the RA Property in the absence of risk management measure (RMMs).

Onsite Outdoor Worker, Indoor Worker, Site Visitor, and Resident receptors could be exposed to surface soil. Onsite Construction and Utility Workers receptors could be exposed to surface and subsurface soil. Offsite receptors could be exposed to COCs migrating offsite through soil particulate or groundwater migration. Groundwater is not typically accessible to receptors other than Construction and Utility Workers. Section 4.2.1 provides additional details on potential receptors.

Figure 4-1 presents the Human Health CSM that was developed for the RA Property under current and proposed future conditions. It was based on, and is consistent with, information gathered during site investigation activities and visits described in Section 3 and Appendix D. Section 4.2 describes in more detail how the Human Health CSM was developed and used in the HHRA. Figure 4-2 illustrates the Human Health CSM that is relevant after the RMP in Section 7 of this document is implemented.

4.1.2 Contaminant of Concern Screening for Human Health

Chemical screening incorporates elements of toxicity analysis and exposure assessment by selecting screening criteria that have previously been developed through an RA approach. Risk-based screening criteria use toxicity reference values (TRVs) derived by regulatory agencies in Canada and the United States (U.S.). Regulatory agencies use TRVs to back-calculate standards considered protective of various land uses. The risk-based standards also incorporate assumptions regarding the most sensitive receptor characteristic, such as body weight (BW), ingestion rate, and exposure duration (ED) (based on land use). Chemical screening was conducted to focus the number of retained COCs for the quantitative HHRA.

As presented in Section 3.3, Contaminants of Concern, parameters in soil and groundwater were screened against the Ministry of the Environment, Conservation and Parks (MECP's) *Table 6: Generic Site Condition Standards for Shallow Soils in a Potable Groundwater Condition* for Residential/ Parkland/ Institutional/ Industrial/ Commercial/Community property use (Table 6 SCS) (MECP, 2011c) based on detected concentrations and method detection limits (MDLs) (refer to Tables F1-1 and F1-2 in Appendix F). This screening process identified the set of COCs requiring evaluation in both the HHRA and ecological risk assessment (ERA).

The following subsections outline the secondary screening process for human health and identify which COCs were assessed quantitatively or qualitatively.

Estimated Site Maximums. Jacobs used estimated Site maximums to complete the secondary human health screening and risk calculations; the approach was inferred from information provided in the Modified Generic Risk Assessment (MGRA) model spreadsheet (MECP, 2016a; 2016b). The MGRA model spreadsheet accepts an estimated maximum concentration up to 20 percent greater than the measured maximum. The estimated Site maximums were, therefore, derived by applying the greater of the maximum detected concentration, multiplying it by 1.2 and then rounding it down to two significant digits, as appropriate, or by applying the MDL. Jacobs did not apply this calculation to COCs with observed maximum concentrations based on an MDL.

Chemical Fate and Transport. The potential fate and transport of a chemical is characterized, in part, by its physical and chemical properties. Water solubility predicts the amount of a chemical that will dissolve in water. The soil sorption coefficient predicts the ratio of the chemical mass that will adsorb to soil versus the mass that will dissolve in soil pore water. The vapour pressure of a chemical can indicate the likelihood that a chemical will volatilize from its pure compound state; chemicals with high vapour pressures are expected to readily volatilize. The Henry's Law Constant (H) for a chemical indicates the theoretical amount of a chemical that will volatilize from the dissolved water phase to the vapour phase; chemicals with high H (that is, greater than 1×10^{-5} [atmospheres per cubic metre per mol [atm-m^3/mol]) or a high vapour pressure (that is, greater

than 1.0 Torricelli [Torr] [Blok, 2019, pers comm.]) are expected to volatilize. Inorganics were not considered volatile; therefore, they were not retained for the vapour inhalation (VI) pathway. The heavier petroleum hydrocarbons (PHCs) (that is, PHC F3 and PHC F4) were also not considered volatile, and were not retained for the VI pathway. Additional details on the volatility designation of parameters are presented in Appendix F2.

As part of the exposure assessment, these values are examined for each COC to evaluate the potential for migration and to model the movement of COCs from the subsurface to a receptor along a potentially complete exposure pathway. Chemical properties provided in the Rationale Document (MECP, 2011a) were used in this assessment unless otherwise indicated. Jacobs used the chemical properties provided in the Rationale Document (MECP, 2011b) in this assessment, unless otherwise indicated.

Tables 4-1 and 4-2 present the estimated maximum concentrations for soil and groundwater. Section 4.1.2.1 describes the secondary screening process for soil.

4.1.2.1 Soil Screening

Parameters were retained for *quantitative* analysis related to direct contact exposure to soil if the parameter was selected as a COC through the screening process in Section 3.3 and its estimated site maximum concentration is greater than the S1 (direct contact) component values used to derive the Table 2 *Full Depth Generic Site Condition Standards in a Potable Ground Water Condition* for coarse-grained soils and residential/parkland/institutional land use (Table 2 Standard) (Appendix F1, Table F1-3).

Parameters were retained for *quantitative* analysis related to inhalation of dust particulate if the parameter was selected as a COC through the screening process in Section 3.3, and the parameter was retained for direct contact exposure to soil (that is, the estimated maximum concentration is greater than the Table 2 S1 component value) (Appendix F1, Table F1-3).

Jacobs employed a two-step screening process for the selection of parameters to be retained for *quantitative* analysis related to inhalation of volatiles through the soil-to-indoor-air (S-IA) pathway and the soil-to-outdoor-air pathway[2] (including inhalation in a trench). Appendix F2 provides additional details on the volatility designation of the COCs (Appendix F2, Table F2-1) and the screening process applied to soil COCs determined to be volatile (Appendix F2, Table F2-2).

COCs and pathways that were not retained for quantitative assessment were, therefore, retained for qualitative assessment. Refer to Section 4.4.3. Table 4-1 summarizes the pathways to be retained for each COC resulting from the secondary screening. Appendix F1, Table F1-3 and Appendix F2, Table F2-2 provide the detailed screening for non-volatile COCs and volatile COCs, respectively.

4.1.2.2 Groundwater Screening

Parameters were retained for *quantitative* analysis related to direct contact exposure to groundwater (for Construction and Utility Workers) and potable water use for Residents if the parameter was selected as a COC through the screening process in Section 3.3, and its estimated site maximum concentration is greater than the GW1 (direct contact) component value used in the derivation of the Table 2 Standard (MECP, 2011a) (Appendix F1, Table F1-4).

Jacobs employed a two-step screening process for the selection of parameters to be retained for quantitative analysis related to inhalation of volatiles through the groundwater- to-indoor-air (GW) pathway and the groundwater-to-outdoor-air pathway (including inhalation in a trench). Appendix F2 provides additional

[2] Appendix G2 provides the rationale for why the MECP outdoor air (OA) component values were not specifically used in the RA.

details on the volatility designation of the COCs (Appendix F2, Table F2-1) and the screening process applied to groundwater COCs determined to be volatile (Appendix F2, Table F2-2).

COCs and pathways that were not retained for quantitative assessment were, therefore, retained for qualitative assessment. Refer to Section 4.4.3. Table 4-2 summarizes the results of the secondary screening. Appendix F1, Table F1-4 and Appendix F2, Table F2-2 provide the detailed screening for non-volatile COCs and volatile COCs, respectively.

4.1.2.3 Additional Considerations Applicable to the Human Health Risk Assessment

Approach for Polycyclic Aromatic Hydrocarbons

The MECP uses a toxicity equivalence factor (TEF) approach to assess risks related to environmental mixtures of carcinogenic polycyclic aromatic hydrocarbons (PAHs). Jacobs reviewed Canadian Council of Ministers of the Environment (CCME) guidance on PAHs when selecting an approach to assess risks related to environmental mixtures of carcinogenic PAHs (CCME, 2010).The MECP guidance indicates that when it is possible for exposure to a PAH mixture to occur at a site, the combined carcinogenic risk from all PAHs with the same mode of action must be assessed, even if an individual PAH is present at a concentration less than its individual SCS.

The TEF approach to assessing potential carcinogenic risks related to environmental mixtures of PAHs is based on evaluating the relative toxicity of carcinogenic PAHs to benzo(a)pyrene (B(a)P). Table 4-3 presents the TEFs applied in this assessment.

To assess the combined carcinogenic risk from all PAHs at the RA Property, a total toxicity equivalence concentration (Washington Department of Ecology, 2008) or benzo(a)pyrene equivalent (B(a)PE) (Law et al., 2002) must be developed as follows:

$$B(a)PE = \sum(Cn \times TEFn) \qquad (1)$$

Where:

Cn = Concentration of the individual carcinogenic PAH in the mixture (micrograms per gram [µg/g] for soil and micrograms per litre [µg/L] for groundwater)

TEFn = Toxic equivalency factor of the individual carcinogenic PAH in the mixture

For each sample (soil or groundwater) analyzed for PAHs, a B(a)PE value was calculated per Equation (1). Half detection limits were used in the calculation for concentrations that were reported as nondetect. The calculated B(a)PE values were evaluated, and the maximum B(a)PE concentration was retained for use in the RA (Table 4-4). The estimated maximum concentration was applied (maximum result multiplied by 1.2), to produce a B(a)PE for soil of 282 µg/g and a B(a)PE for groundwater of 10.3 µg/L.

As contact with PAHs may occur through the dermal, ingestion, and dust-inhalation pathways, these pathways were evaluated using the B(a)PE. Results for these parameters appear as B(a)PE within the tables and text in Section 4.

Approach for Canadian Council of Ministers of the Environment Petroleum Hydrocarbons

The MECP has adopted the CCME Tier 1 standards for petroleum hydrocarbons (PHCs) in soil (CCME, 2008), and included them in the O. Reg. 153/04 Standards (as amended). Assumptions are available to

estimate appropriate concentrations of CCME subfractions, based on the available gross PHC measurements. For PHCs in soil, the CCME determined proportions for the 14 subfractions considered in the Total PHC Criteria Working Group (TPHCWG) (1997a,b; 1998a,b; 1999) approach within the four CCME fractions, based on published data. Table 4-5 summarizes these proportions, which were applied to the PHC fraction soil sampling results and used to evaluate the associated risk.

For PHC in groundwater, Health Canada has identified proportions for the 14 subfractions within the four CCME fractions in the *Preliminary Quantitative Risk Assessment (PQRA) Guidance Part IV* (Health Canada, 2008). Table 4-6 summarizes these proportions, which were applied to the PHC fraction groundwater sampling results and used to evaluate the associated risk.

Approach for Parameters without Toxicity Data

Human health toxicity data may not be available for all parameters evaluated in the HHRA. Refer to Section 4.4.3.5 for the qualitative assessment of electrical conductivity (EC) and lead, which do not have human health toxicity data.

Approach for Vinyl Chloride in Groundwater

In accordance with the *Rationale Document* (MECP, 2011b), the RA evaluated the potential for chlorinated ethylene concentrations in groundwater to degrade to vinyl chloride (VC). As the MECP guidance document discusses, the anaerobic biodegradation of chlorinated compounds to VC involves a reductive dechlorination step, which is influenced by chemical-specific parameters (that is, solubility) and site-specific geochemical parameters (that is, oxidation-reduction [redox] potential). The following chlorinated parent compounds are known to degrade to VC through reductive dechlorination (MECP, 2011b):

- Trichloroethylene (TCE)
- Tetrachloroethylene (PCE)
- 1,1-Dichloroethylene (1,1-DCE)
- cis-1,2-Dichloroethylene (cis-1,2-DCE)
- trans-1,2-Dichloroethylene (trans-1,2-DCE)

To account for the potential degradation of parent compounds to VC at the RA Property, the maximum concentrations of the parent compounds were summed, and 10 percent of the sum was added to the maximum VC concentration (identified as the greater of the detected concentration and MDL) to produce a potential VC concentration. An estimated maximum VC concentration was also derived by either multiplying the maximum detected VC concentration by 1.2 (if the maximum detected concentration exceeded the MDL), or applying the maximum VC detection limit. The greater of the potential VC concentration and estimated maximum VC concentration was applied as the input value in the risk calculations. Using the greatest VC concentration from these two methods provides a conservative estimate of potential future site-related risks by accounting for the potential degradation of VC parent compounds.

Table 4-7 summarizes concentrations of VC and its parent compounds in groundwater as well as the development of the potential VC concentration and compares this value to the estimated maximum VC concentration. The input value for modelling and risk calculations for the RA Property groundwater used a VC concentration of 990 µg/L, based on the estimated maximum concentration.

Approach for the Presence of Nonaqueous Phase Liquid

Over the course of the Phase Two investigation activities, nonaqueous phase liquid (NAPL) was measured in three locations: OW23S, MW17-108S, and MW18-135S. NAPL has been measured at OW23S (screened from 2.52 and 5.26 metres below ground surface [mbgs]) at thicknesses of 0.005 to 0.97 m in 21

monitoring events between 2010 and 2020. At MW17-108S (screened from 1.93 and 4.98 mbgs), NAPL has been measured at thicknesses of 0.002 and 0.18 m in six monitoring events between 2017 and 2020. At MW18-108S (screened from 4.27 to 5.79 mbgs), NAPL has been measured at thicknesses of 0.02 and 0.93 m in five monitoring events between 2019 and 2020.

The presence of NAPL could have implications for the risk evaluations that rely on the application of partitioning equations (that is, movement to indoor and outdoor air). Direct contact exposure to NAPL itself would also be possible if NAPL was present. The MECP SCS and component values considered in the evaluation of soil and groundwater COCs, and the equations applied in the calculations of risk and hazard, assume that NAPL-associated contaminants (such as PHCs; benzene, toluene, ethylbenzene, and xylenes (BTEX); and PAHs) are distributed between the dissolved, vapour, and sorbed phases (that is, three phases are considered). If NAPL is present, an additional fourth phase must be considered. Section 4.4.3.6 qualitatively evaluates the potential risks to human health from NAPL.

4.1.3 Risk Assessment Objectives

The objective of the HHRA is to estimate the potential health risks to human receptors from the COCs identified in RA Property soil and groundwater in the absence of RMMs. The RA Property is currently proposed to be redeveloped into mixed residential, parkland, and commercial use. As such, the HHRA assessed the following receptors:

- Residents
- Site Visitors
- Construction Workers
- Utility Workers
- Outdoor Workers
- Indoor Workers

As detailed in the CSM, the assessment included exposure pathways related to the ingestion of, dermal contact with, and the inhalation of COCs originating from impacts in soil or groundwater.

Risk is assessed both quantitatively and qualitatively. Quantitative risk characterization is conducted to evaluate the noncancer hazard and cancer risk posed by Site COCs to each receptor for identified potentially complete pathways. In some cases, the risk was assessed qualitatively, based on the exposure of certain receptors being protected by quantitative evaluation of a more sensitive receptor, and based on select pathways being demonstrated to be incomplete. The quantified levels of risk were used to determine whether RMMs are required at the Site. Property-specific Standards (PSSs) were also determined as required.

Human health risks and hazards were calculated for the RA Property following a standard RA approach under O. Reg. 153/04. Section 1.1.1 describes the general framework for carrying out the RA.

4.1.3.1 Jacobs Quality Control and Data Quality Objectives

Soil and groundwater sampling was either performed or supervised by Jacobs staff with experience in intrusive field investigation techniques and with the COCs encountered at the Site, under the supervision of a MECP Qualified Person for ESAs (QPESA). Soil and groundwater sampled by Jacobs between 2017 and 2020 were collected according to our standard operating procedures (SOPs), which were developed in accordance with O. Reg 153/04 (MECP, 2011a). The selected analytical laboratories performed the chemical analysis in compliance with the MECP's Laboratory Services Branch *Protocol for Analytical Methods Used in the Assessment of Properties under Past XV.1 of the Environmental Protection Act,* as amended (MECP, 2011d).

In combination with the field QA/QC program, a Jacobs project chemist has completed an evaluation of the laboratory QA/QC program to verify the accuracy, precision, and validity of the data reported by the laboratory. Various elements of the laboratory QA/QC program are used to evaluate the data: blanks are analyzed to detect laboratory contaminations that can cause data to be biased high; laboratory control samples are used to evaluate the laboratory performance; laboratory duplicates are used to measure precision in the laboratory; matrix spikes are used to identify high or low bias caused by matrix interference; and surrogate spikes are used to evaluate the method performance that can cause high or low bias in the data. Evaluation of the laboratory QA/QC program was performed by examining blanks, laboratory control samples, matrix spikes, and surrogate spike samples.

The groundwater and soil analytical data evaluated herein is considered valid. All results can be used to support the project decision making process. Appendix D2 provides additional details on the QA/QC program.

The current database includes soil and groundwater data from past investigations completed by other consultants. As discussed in Section 3.3.2, Jacobs determined that some historical soil data are useful for inclusion in the RA report. Appendix D2 lists the historical reports which were included as part of the Phase Two ESA.

Since the intent is to manage the potential risk associated with soil and groundwater contamination in place by using engineering controls as necessary, Jacobs considers the data collected to be adequate. Uncertainties associated with data quality are not likely to affect the objectives of the RA or the ability of current and future land owners to manage potential risks at the RA Property. Overall, the quality of data used in the RA were considered sufficient to meet the objectives of the HHRA and to be usable for RA decision making.

4.2 Exposure Assessment

The exposure assessment quantifies or estimates the potential exposure to environmental media (for example, groundwater or air) in which humans could possibly have contact with COCs at the RA Property under current and future scenarios. This section also presents the methodology used to estimate exposure concentrations, the equations and models, as well as the exposure assumptions used for the retained exposure pathways.

4.2.1 Receptor Characteristics

For this RA, receptor assumptions have been compiled for human characteristics for use in quantitatively or qualitatively determining the various exposure doses or exposure concentrations. MECP (2011b) or Canadian-specific values were used where available. Other sources of human factor parameters included information generated by the U.S. Environmental Protection Agency (EPA), which Jacobs adopted and used here based on an understanding of similarities between U.S. and Canadian populations. If a piece of information could not be obtained from a credible source, Jacobs assumed a conservative estimate based on professional and scientific judgment. Section 4.2.3, Exposure Estimates, describes the characteristics of each retained receptor by pathway.

The proposed future use of the RA Property is mixed residential, parkland, and commercial. Based on this proposed future use, the receptors included in the HHRA for quantitative and qualitative assessment are presented in Table 4-8.

Where appropriate, Jacobs used a composite human receptor. This means a lifetime of exposure and risk was evaluated based on adjusted age characteristics calculated using a weighted average for each parameter from each of the five life stages summed to derive a composite value.

Individual descriptions for each receptor considered in the HHRA are as follows:

- **Resident** – The Resident is assumed to be an infant, toddler, child, teen, adult, or composite receptor residing within a proposed residential building. The Resident is anticipated to spend the majority of his or her time indoors but would also spend a limited amount of time outdoors within the RA Property. The Resident could be exposed to soil via direct contact (incidental ingestion, dermal contact, and dust inhalation), to potable groundwater via direct contact (ingestion of drinking water and dermal contact), via the inhalation of indoor air (that is, the migration of volatile COC vapours from soil and groundwater to indoor air), and via the inhalation of vapours in outdoor air (COC vapour emissions from soil and groundwater to outdoor air). The Resident is anticipated to be present onsite 24 hours a day, 7 days a week, 50 weeks per year, for 76 years.
- **Site Visitor** – The Site Visitor is assumed to be an infant, toddler, child, teen, adult, or composite receptor visiting the RA Property for residential, parkland, or commercial purposes. The Site Visitor could be exposed to soil via direct contact (incidental ingestion, dermal contact, and dust inhalation), to potable groundwater via direct contact (ingestion of drinking water and dermal contact), and via the inhalation of vapours in outdoor air (COC vapour emissions from soil and groundwater to outdoor air). Site Visitor exposure to Site media is expected to be less than that of the Resident; therefore, exposure and risk to Site Visitors was qualitatively assessed in terms of the results for Residents. Site Visitors are conservatively assumed to be present onsite for a portion of each day, 7 days a week.
- **Construction Worker** – A Construction Worker is considered to be an adult worker conducting excavation activities extending to the water table, such as those that would occur during construction or redevelopment activities. The Construction Worker could be exposed to soil via direct contact (incidental ingestion, dermal contact, and dust inhalation); to groundwater via direct contact (incidental ingestion and dermal contact[3]); and via the inhalation of vapours in outdoor air (COC vapour emissions from soil and groundwater). The Construction Worker is anticipated to be onsite full-time, 5 days a week, for a limited number of years, and would represent a subchronic subsurface worker exposure scenario.
- **Utility Worker** – The Utility Worker is considered to be an adult worker conducting ground-intrusive activities that extend to the water table, such as those that would occur during the maintenance, installation, or repair of subsurface utilities. The Utility Worker could be exposed to soil via direct contact (incidental ingestion, dermal contact, and dust inhalation); to groundwater via direct contact (incidental ingestion and dermal contact[3]); and via the inhalation of vapours in outdoor air (COC vapour emissions from soil and groundwater). The Utility Worker is anticipated to be onsite full-time for a limited number of days per year, but for a significant number of years (that is, 56 years), thus represents an intermittent subsurface worker exposure scenario. This assumption is consistent with Health Canada (2004) which indicates 2 weeks per year for a construction worker, with the understanding that this receptor represents a utility worker, despite differences in naming convention.

[3] For the subsurface worker scenarios, it is expected that typical construction worker attire will be worn during these construction activities (for example, per O. Reg. 213/91, as amended [MOL, 1991]). With regards to groundwater contact, it is expected that typical construction activities, such as dewatering, will be performed (for example, per O. Reg. 213/91, as amended [MOL, 1991] which states that, "every excavation that a worker may be required to enter shall be kept reasonably free of water"). Given the use of dewatering techniques at construction sites (regardless of whether they are brownfields or not), which limits the presence of groundwater in construction areas, typical construction worker activities do not lead to extensive skin wetting. These typical construction activities are not considered risk management measures, as they are required by the Province of Ontario on every construction site, regardless of whether contamination is present or not.

- **Outdoor Worker** – The Outdoor Worker is considered to be an adult working primarily outdoors at the RA property to maintain landscaped areas. The Outdoor Worker could be exposed to soil by direct contact (incidental ingestion, dermal contact, and dust inhalation) and via the inhalation of vapours (COC vapour emissions from soil and groundwater) in outdoor air. As the average depth to groundwater (2.70 mbgs) is deeper than 1 mbgs, it is not expected that the Outdoor Worker would come into contact with groundwater during planting activities. The Outdoor Worker is conservatively anticipated to be onsite full-time (9.8 hours per day), 5 days a week, 39 weeks per year, for 56 years to tend to ornamental gardens and perform periodic landscape installations and grounds maintenance.
- **Indoor Worker** - The Indoor Worker is considered to be an adult working indoors within a future generic commercial building, with a limited amount of time spent outdoors. The Indoor Worker could be exposed to Site COCs via the inhalation of indoor air (migration of volatile COC vapours from soil and groundwater to indoor air). Exposures also considered include the inhalation of vapours in outdoor air (COC vapour emissions from soil and groundwater to outdoor air) and direct contact with Site soil (incidental ingestion and dermal contact). However, Jacobs notes that an Outdoor Worker would have greater exposure than the Indoor Worker to inhalation of vapours in outdoor air and direct contact with soil. Therefore, the risk to the Indoor Worker will be qualitatively assessed for these latter two pathways in the context of the Outdoor Worker. The Indoor Worker is anticipated to be onsite full-time (9.8 hours indoors per day), 5 days a week, 50 weeks per year, for 56 years.
- **Offsite Surface Receptors** – This receptor group incorporates offsite surface receptors (that is, receptors not engaged in subsurface excavation activities), such as Indoor Workers, Outdoor Workers, Site Visitors, Residents, patrons of nearby properties, or a combination thereof. Properties adjacent to the RA Property are generally used for industrial and commercial purposes. Approximately four residential properties are located to the west of the RA Property (cross-gradient), across Stevenson Street South. The Offsite Surface Receptors may be exposed to dust (soil particulates) migrating offsite during potential construction activities at the Site in the absence of RMMs. The movement of COCs offsite with groundwater flow may also contribute to a complete VI pathway (both indoors and outdoors) for offsite receptors. Offsite Outdoor Workers, Indoor Workers, Residents, or patrons of nearby properties are anticipated to be present offsite for the same amount of time as the corresponding onsite receptors. Therefore, exposure and risk to these offsite receptors are expected to be less than that of similar onsite receptors. These receptors were qualitatively assessed in terms of onsite Outdoor Workers, Indoor Workers, and Residents. These receptors were qualitatively assessed for the potential for risk from offsite migration of COCs.
- **Offsite Construction and Utility Worker** – This receptor group incorporates Construction and Utility Workers engaged in excavation activities downgradient of the RA Property that may be exposed to groundwater that has migrated offsite from the RA Property. Exposure and risk to these offsite receptors is anticipated to be less than that of similar onsite receptors; therefore, these receptors were qualitatively assessed in terms of the onsite results for Construction and Utility Workers.

Tables 4-9, 4-10, 4-11, and 4-12 present specific receptor assumptions (for example, BW, skin surface area, and ED) for receptors requiring quantitative assessment.

A Pregnant Female receptor was also included in the RA for quantitative assessment of risk related to COCs with developmental effects. For the direct contact pathways, this receptor is used in each quantitatively assessed exposure scenario that does not include a toddler (for example, Indoor Worker, Outdoor Worker, Construction Worker, and Utility Worker). The calculations for pregnant female receptors assume continuous exposure without prorating for exposure frequency (EF) or ED because an exposure limit may be exceeded during any one of many critical developmental periods during pregnancy. The exposure estimates for the Pregnant Female Worker or Pregnant Female Resident for each scenario were

then appropriately carried through for risk evaluation for COCs where Section 4.3.2.1 identifies potential developmental effects.

4.2.2 Pathway Analysis

A complete exposure pathway must exist for risk to be present at a site. An exposure pathway is the means by which a receptor may make contact with a COC from a site. A complete exposure pathway has the following five elements:

1) A source of chemical released to the environment (for example, PHC to soil)
2) A mechanism for release of the source (for example, volatilization of vapours)
3) An environmental transport medium (for example, air)
4) An exposure point (for example, a workplace)
5) A feasible route of exposure (for example, inhalation)

Exposure may occur when environmental media containing chemicals migrate or are physically moved from the site to an exposure point, such as a location where receptors can make contact with chemicals in environmental media. It may also take place when a receptor makes direct contact with the source material containing the COCs. An exposure pathway is complete (that is, there is exposure) if a receptor takes in chemical constituents through ingestion, inhalation, or dermal absorption (contact with the skin).

Direct contact with contaminants occurs when receptors make direct contact with the medium that contains the contaminants (for example, placing hands in water or touching soil with hands). Indirect contact with the contaminants occurs when the contaminants are transported from their presently identified location to a receptor through a variety of mechanisms (for example, the inhalation of indoor vapours originating from soil or groundwater).

This section discusses possible pathways of exposure to COCs by receptors on and off the RA Property. Incomplete or implausible pathways where there can be no exposure are not retained for the RA. Table 4-13 and Section 4.2.2.1 present the rationale for retaining or eliminating these pathways.

The potential soil and groundwater exposure pathways have been evaluated based on current Site conditions and considering future Site conditions following redevelopment.

4.2.2.1 Site-specific Pathway Analysis Summary

Table 4-13 presents the pathway analysis for the HHRA. Based on the Site characterization and chemistry, the current and proposed land use, and the anticipated receptors on the RA Property, Jacobs quantitively assessed the following exposure pathways and receptors:

- Ingestion and dermal contact with soil and groundwater
- Inhalation of volatiles in indoor air (derived from soil and groundwater)
- Inhalation of volatiles in outdoor air (derived from soil and groundwater)
- Inhalation of particulates (dust derived from soil) in outdoor air

Jacobs performed risk calculations for the maximally exposed receptor and pathway scenarios, as indicated in the Rationale column of Table 4-13. Jacobs qualitatively evaluated potential risks to receptors and pathways not specifically modelled from the maximally exposed quantitative results.

The following paragraphs discuss the pathways that are complete but were not quantitatively assessed.

Direct Contact Exposure—Vapour Skin Contact

Dermal exposure to vapours may be a significant pathway of exposure to chemicals in some cases; however, this pathway was not assessed in the HHRA because of the uncertainties associated with the numerous assumptions required to quantify the exposure. For example, the equations available for quantifying dermal absorption of chemical vapours are typically simplistic (and often inaccurate), as they do not account for variability of skin penetration, variability of skin exposure, temperature and humidity, and evaporation from skin following deposition onto skin. As such, while dermal exposure to vapours is a potentially complete pathway at the RA Property, given the uncertainty associated with the quantification of this pathway and the general belief that it does not contribute greatly to a receptor's overall exposure and body burden unless he or she is wearing a respirator (which is not anticipated at the RA Property), this pathway is not quantitatively evaluated. A qualitative assessment of the dermal exposure to vapours pathway is presented in Section 4.4.3.3.

Non-Aqueous Phase Liquid Exposure

As discussed in Section 4.1.2.3, NAPL has been identified at the RA Property, and there is potential for it to remain following redevelopment. The presence of NAPL could have implications for the risk evaluations that rely on the application of partitioning equations (that is, movement to indoor and outdoor air). Direct contact exposure to NAPL itself would also be possible where NAPL is present. Section 4.4.3.6, discusses the qualitative assessment of NAPL at the RA Property.

Ingestion Exposure— Home Grown Garden Produce

The ingestion of home-grown garden produce may be a significant pathway of exposure to chemicals in some cases; however, this pathway was not quantitatively assessed in the HHRA because of the uncertainties associated with the numerous assumptions required to quantify the exposure. For example, there is a significant amount of uncertainty associated with the uptake of certain soil COCs into the edible portions of plants. In addition, factors such as the potential yield of an urban garden, the amount and type of produce consumed, and the effects of various methods of food preparation are difficult to quantify. While it is not anticipated that a significant portion of a Resident's normal diet would be derived from home garden produce, potential risks can be mitigated by implementing the use of RMMs that limit or prohibit gardens that produce fruits and vegetables for consumption, or by requiring that home gardens only be grown in containerized plots or aboveground containers. Therefore, this pathway is not quantitatively evaluated. A qualitative assessment of this pathway is presented in Section 4.4.3.7.

Qualitative Assessment of Inhalation of Soil Particulates that are Ingested

Exposure from COCs in soil can occur from inhalation via two primary routes of exposure. Smaller particulates (less than or equal to PM_{10}) may be inhaled into the lungs and larger particulates (greater than PM_{10} and less than PM_{30}) may be trapped in the upper respiratory tract and subsequently swallowed and ingested (MassDEP, 2008). The portion of this pathway where particulates reach the lungs has been quantitatively assessed in Section 4.4.3.8. However, the particulate ingestion portion is considered negligible relative to the ingestion exposure experienced by a receptor via the conventional incidental ingestion of soil pathway (refer to Section 4.4.2.4). Exposure from particulate ingestion may be a significant pathway of exposure to chemicals in some cases; however, for typical construction projects using MECP default assumptions (as is the case for this RA), the exposure and risk from this pathway is negligible. Therefore, this pathway was not quantitatively assessed. A qualitative assessment of this pathway is presented in Section 4.4.3.8.

4.2.3 Exposure Estimates

This section summarizes the methodology and exposure factors used to estimate dose concentration. Exposure estimates were calculated for the human health exposure pathways that were retained through the screening process. Daily intake (DI) and daily uptake (DU) are defined as the product of chemical concentration in the source material, multiplied by the amount of intake or uptake (or source material the body contacts or adsorbs), respectively.

$$Dose = Chemical\ Concentration \bullet Intake\ (or\ uptake) \quad (2)$$

Intake is generally used to describe administered doses (ingestion and inhalation), while uptake refers to absorbed doses (dermal).

Eight basic factors are used to estimate intake (or uptake):

1) C = Chemical concentration (milligrams per kilogram [mg/kg], µg/g, milligrams per litre [mg/L], milligrams per cubic metre [mg/m^3], or micrograms per cubic metre [µg/m^3])
2) CR = Contact rate; the amount of contaminated medium contacted (milligrams [mg], litres [L], or cubic centimetres [cm^3] per hour or day)
3) ET = Exposure time (hours per day) for *continuous* exposures (that is, inhalation)
4) EF = Exposure frequency (days per week, weeks per year)
5) ED = Exposure duration (total years)
6) BW = Body weight
7) AT = Averaging time (associated with the period of exposure and effects)
8) RAF = Relative absorption factor

Daily absorbed or administered dose (DAD) can be described by the following general equation:

$$DAD = \frac{C * CR * ET * EF1 * EF2 * ED * RAF}{BW * AT} \quad (3)$$

In this assessment, intake (or uptake) is normalized for time and BW, and is expressed in milligrams of chemical per kilogram of BW per day (mg/kg/d). This calculation has been completed for all exposure routes except inhalation, according to the MECP (2011b) (after [EPA, 2009]).

The chemical concentration (C) used for each exposure route was determined and discussed in previous sections. The CR for each exposure point is discussed in Sections 4.2.3.2 through 4.2.3.6.

Appendix G1 provides sample calculations for the exposure estimates referenced in this section. Calculations were performed using Microsoft Excel.

4.2.3.1 Dose Estimation for Carcinogens and Noncarcinogenic Effects

The intake of a chemical evaluated for carcinogenic health effects is averaged over an entire lifespan (that is, lifetime average chemical intake) of 56 years for workers. For carcinogens, the lifespan in years is referred to as the AT. The selection of an AT that spans a lifetime is based on EPA guidance (1989): *"The approach for carcinogens is based on the assumption that a high dose received over a short period of time is equivalent to a corresponding low dose spread over a lifetime."*

Typically, EPA recommends 70 years for residents as the AT for carcinogens; however, Health Canada recommends 75 years (Health Canada, 2010). The MECP has used 76 years to account for ages 0 to 75, inclusive, for lifetime exposure of residents (MECP, 2011b); as such this value was applied in this RA for Recreational Users. The MECP has used 56 years to account for ages 20 to 75, inclusive, for lifetime exposure of adult workers (MECP, 2011b); this value was applied in this RA for those receptors. For carcinogens:

$$AT = 56 \text{ years} \times 365 \text{ days/year} \quad (4)$$

The intake of chemicals evaluated for noncarcinogenic health effects uses an AT based on the estimated period of exposure for any given exposure setting.

For noncarcinogens:

$$AT = ED \times 365 \text{ days/year} \quad (5)$$

The noncarcinogenic risk is evaluated for a target receptor (the group within a potentially exposed population with the greatest potential exposure; that is, the group that receives the greatest intake).

Table 4-9 presents general receptor characteristics, such as BW, ED, and ATs. These inputs are also used in the specific equations that estimate dose for dermal, ingestion, and inhalation pathways, which are described in the following sections.

4.2.3.2 Dermal Uptake

Soil

A receptor's average uptake of COCs through dermal contact with soil, or DAD, is estimated using the following equation (based on MECP, 2011b):

$$DAD = \frac{C * DAF * SAF * ESSA * CF * EF1 * EF2 * ED}{BW * AT} \quad (6)$$

Where:

DAD = Daily absorbed or administered dose via dermal contact (mg/kg/d)

C = Chemical concentration in soil (mg/kg)

SAF = Soil adherence factor (mg per square centimetre [cm^2] per day)

DAF = Dermal absorption factor (unitless)

ESSA = Exposed skin surface area (cm^2)

CF = Conversion factor (10^{-6} kilograms per milligram [kg/mg])

*EF*1 = Exposure frequency (weeks per year)

*EF*2 = Exposure frequency (days per week)

ED = Exposure duration (years)

BW = Body weight (kilograms [kg])

AT = Averaging time (days)

This calculation of DAD via dermal contact assumes one soil contact event per day. Table 4-10 summarizes the values used to estimate the daily dermal uptake from soil.

Groundwater

A receptor's average uptake of COCs through dermal contact with groundwater is estimated using the following equation (based on EPA, 2004):

$$DAD = \frac{DA_{event} * FE * ESSA * EF1 * EF2 * ED}{BW * AT} \quad (7)$$

Where:

DAD = Daily absorbed or administered dose (mg/kg/d)

DA_{event} = Absorbed dose per event (mg/cm^2/event); the equations applied in the derivation of DA_{event} are presented in Appendix G1

FE = Frequency of events (event per day)

ESSA = Exposed skin surface area (cm^2)

*EF*1 = Exposure frequency (days per week)

*EF*2 = Exposure frequency (weeks per year)

ED = Exposure duration (years)

BW = Body weight (kg)

AT = Averaging time (days)

The value of DA_{event} depends on the physical and chemical properties of the chemical being assessed (for example, dermal permeability factors, organic or inorganic chemical), event duration, concentration of the chemical in groundwater, and other factors. A discussion of the details for modelling exposure from this route can be found in the EPA's final *Risk Assessment Guidance for Superfund Volume I: Human Health Evaluation Manual (Part E, Supplemental Guidance for Dermal Risk Assessment)* (RAGS E) (EPA, 2004). This model estimates the rate of migration of a chemical through a receptor's skin during contact with impacted groundwater. Dermal permeability values (K_p), derived from either experimentally measured or predicted values, are used together with Site-specific receptor exposure characteristics to estimate exposure.

The potential for Construction or Utility Workers to make contact with contaminated groundwater is low, since typical construction methods (that is, dewatering) restrict prolonged contact with groundwater that may be present onsite. Exposure assumptions for Construction and Utility Worker contact with groundwater are included in Table 4-10.

Relative Absorption Factors

Relative absorption factors (RAFs) were used in this assessment. The terms dermal absorption factor (DAF) and gastrointestinal absorption factor (GIAF) are used in this assessment for dermal and ingestion exposures, respectively. The values are consistent with the values used by the MECP in the development of the 2011 Standards (MECP, 2011b) or in EPA RAGS E (2004), if a MECP value was not available. If a suitable RAF value for a COC could not be determined, absorption was assumed to be the same as that in the TRVs critical study (that is, 100 percent or an RAF of 1.0). Table 4-14 presents the RAFs used in the assessment.

Dermal Exposure Estimates

Tables 4-15 and 4-16a/b show the predicted dermal exposures to soil and groundwater (potable and subsurface contact), respectively.

4.2.3.3 Ingestion

Soil

A receptor's average uptake of COCs through incidental ingestion of soil is estimated using the following equation (MECP, 2011b; EPA, 1989):

$$DAD = \frac{C * IR_S * GIAF * CF * EF1 * EF2 * ED}{BW * AT} \quad (8)$$

Where:

DAD = Daily absorbed or administered dose via incidental ingestion (mg/kg/d)

C = Chemical concentration in soil (mg/kg)

IR_S = Quantity of soil ingested daily (milligrams per day [mg/d])

GIAF = Gastrointestinal absorption factor (unitless)

CF = Conversion factor (10^{-6} kg/mg)

*EF*1 = Exposure frequency (weeks per year)

*EF*2 = Exposure frequency (days per week)

ED = Exposure duration (years)

BW = Body weight (kg)

AT = Averaging time (days)

Table 4-14 summarizes the GIAFs used to estimate the ingestion intake from soil.

Groundwater

A receptor's average uptake of COCs through incidental ingestion of groundwater is estimated using the following equation (MECP, 2011b; EPA, 1989):

$$DAD = \frac{C * IR_W * GIAF * FE * CF * EF1 * EF2 * ED}{BW * AT} \quad (9)$$

Where:

DAD = Daily absorbed or administered dose (mg/kg/d)

C = Chemical concentration in groundwater (µg/L)

IRW = Quantity of groundwater ingested daily (L per event)

GIAF = Gastrointestinal absorption factor (unitless)

FE = Frequency of events (events per day)

CF = Conversion factor (0.001 milligram per microgram [mg/µg])

*EF*1 = Exposure frequency (weeks per year)

*EF*2 = Exposure frequency (days per week)

ED = Exposure duration (years)

BW = Body weight (kg)

AT = Averaging time (days)

Table 4-14 summarizes the GIAFs used to estimate the ingestion intake from groundwater (Construction and Utility Workers only). Table 4-11 shows the exposure assumptions for ingestion exposure.

Ingestion Exposure Estimates

Tables 4-17 and 4-18a/b present the predicted exposure from ingestion for soil and groundwater (potable and subsurface contact), respectively.

4.2.3.4 Inhalation

Particulate

The exposure pathway related to the inhalation of fugitive dust derived from soil was evaluated to determine the need, if any, for dust control measures during future construction activities. This evaluation is also protective of exposure during current conditions in the absence of RMMs (that is, no paving or grass covers). The following equation was used to estimate exposure from dust inhalation (MECP, 2011b; Health Canada, 2010a):

$$DAD = \frac{C * PM_{10} * CF * IR_A * FPM_{inh} * EF1 * EF2 * EF3 * ED}{BW * AT} \quad (10)$$

Where:
DAD = Daily adsorbed or administered dose (mg/kg/d)

C = Chemical concentration in soil (mg/kg)

PM_{10} = Particulate concentration in air (µg-soil/m^3)

CF = Conversion factor, 1 kg/10^9 µg

IR_A = Inhalation rate (cubic metres per hour [m^3/hr])

FPM_{inh} = Fraction of particulate matter smaller than 10 microns in diameter (PM10) (unitless); MECP default value of 0.6 is applied herein

*EF*1 = Exposure frequency (days per week)

*EF*2 = Exposure frequency (weeks per year)

*EF*3 = Exposure frequency (hours per day)

ED = Exposure duration (years)

BW = Body weight (kg)

AT = Averaging time (lifetime or ED in years × 365 days per year)

As discussed in Section 4.1.2.1, the COCs in soil identified for quantitative assessment (that is, estimated maximum concentrations were greater than the MECP S1 component value) have been considered COCs for dust modelling in the HHRA.

Table 4-12 summarizes the receptors, receptor characteristics, and exposure assumptions used to model the dust inhalation pathway. Table 4-19 presents the predicted exposure from dust inhalation for the retained receptors.

Volatiles

For inhalation exposures, the amount of the chemical that reaches the target site is not a simple function of the inhalation rate and BW; therefore, intake equations developed based on these parameters are not recommended for estimating exposures to inhaled contaminants. Instead, an exposure concentration is calculated. The following equation was used to estimate exposure from inhalation of volatiles (MECP, 2011b; EPA, 2009):

$$EC = \frac{(C_{air} * EF1 * EF2 * EF3 * ED)}{AT} \quad (11)$$

Where:

EC = Exposure concentration (mg/m^3)

C_{air} = Volatile contaminant concentration in indoor or outdoor air (mg/m^3); this concentration is obtained through modelling, as described in Section 4.2.3.5 (indoor air) and Section 4.2.3.6 (outdoor air), and Appendixes G2 and G3

*EF*1 = Exposure frequency (days per week)

*EF*2 = Exposure frequency to indoor or outdoor air (weeks per year)

*EF*3 = Exposure frequency (hours per day)

ED = Exposure duration (years)

AT = Averaging time (hours)

The exposure concentration is then compared with the appropriate TRV to determine the level of risk.

Table 4-9 presents general receptor characteristics, such as exposure frequencies, EDs, and ATs, applied to the estimate of volatile COCs dose through the inhalation of indoor or outdoor air for all relevant receptors.

4.2.3.5 Soil and Groundwater to Indoor Air

The RA Property is anticipated to be redeveloped as mixed residential, parkland, and commercial. The Site currently consists of vacant land and all onsite buildings have been razed, with concrete floor slabs still in place. Future building plans for the property are unknown. Based on this information, indoor air exposure was modelled for generic residential and commercial building scenarios. For the residential building scenario, Residents are the maximally exposed receptors and for the residential building scenario, Indoor Workers represent the maximally exposed receptor to indoor air for the commercial building scenario. If exposure is determined to be acceptable, then all other receptors listed in Table 4-13 are considered protected. The onsite Site Visitor, Construction and Utility Workers were not retained for quantitative evaluation in this exposure assessment as it is not expected they would be exposed for any extended period within finished buildings.

Modelled Conditions

In September 1998, EPA developed a series of models to estimate indoor air concentrations and associated health risks from subsurface VI into buildings. These models were based on the analytical solutions of Johnson and Ettinger (J&E) (1991) for contaminant partitioning and subsurface vapour transport into buildings, and were updated in 2004.

For groundwater to indoor air evaluations, the depth to groundwater is used to determine whether the J&E model will be applied to calculate the Site-specific attenuation factor. The presence of contaminated groundwater less than 1.0 m away from a building's foundation precludes the use of the J&E Model for modelling VI from COCs in groundwater. In these cases, estimated indoor air concentrations are developed by applying the MECP's empirically derived attenuation values of 0.02 for a residential scenario and 0.004 for a commercial scenario (MECP, 2011b). Because groundwater elevations can fluctuate from spring to winter, the minimum depth to groundwater was used to account for seasonal variations in the water table to determine whether the MECP default attenuation factor or the J&E Model would be used for concentration calculations.

The calculated separation distance (refer to Table G2-2 in Appendix G2) between the foundation and the minimum depth to groundwater indicates the foundation is less than 1 m above the minimum depth to the water table for slab-on-grade foundations. Based on this, estimated indoor air concentrations for the groundwater-to-indoor-air pathway were derived using the MECP default residential and commercial attenuation factors for the generic residential and commercial building scenarios. J&E-modelled attenuation factors were used for the soil-to-indoor-air pathway for the identified building scenarios.

Appendix G2 presents the J&E input parameter table, as well as DATENTER and INTERCALCS worksheets from this assessment.

Indoor Air Vapour Estimates

Table 4-20 presents the predicted indoor air vapour concentrations from soil and groundwater for the generic residential and generic commercial scenarios.

Soil and groundwater–indoor air modelling was completed for the following scenarios:

- Generic Residential building
- Generic Commercial building

Estimated indoor air concentrations were developed through a two-step process. First, volatile partitioning relationships were applied to soil and groundwater data to produce estimated soil gas concentrations at the source. Second, MECP default and J&E-derived attenuation factors were applied to the soil gas concentrations to estimate indoor air concentrations.

These concentrations were used to derive an exposure concentration for each applicable receptor to be compared with the reference concentration (RfC) or unit risk (UR) (if the parameter was a carcinogen, see Section 4.3, Toxicity Assessment).

Spreadsheets indicating the development of the indoor air concentrations for the generic residential and commercial building scenarios are presented in Appendix G2. Calculations were performed using Microsoft Excel.

Tables 4-21a and 4-21b present the predicted exposure of receptors to COCs through the soil-to-indoor-air pathway for the generic commercial and residential building scenarios, respectively. Tables 4-22a and 4-22b

present the predicted exposure of receptors to COCs through the groundwater-to-indoor-air pathway for the commercial and residential building scenarios, respectively.

4.2.3.6 Soil and Groundwater to Outdoor Air Pathway (All Receptors)

Estimating exposure via this pathway involves calculating the predicted concentration of COCs in outdoor air because of the migration of vapours from subsurface soil layers and from groundwater through unsaturated soil into receptors' breathing spaces. The model described by Sanders and Stern (1994) was used to calculate the flux or emission rate of each individual COC at the boundary between the surface of the soil and ambient air. A box model (EPA, 1989) was then employed as a conservative dispersion model to calculate air concentrations of each predicted COC emission from the soil surface. Appendix G3 presents the model specifics, equations, and calculations used to estimate outdoor air concentrations.

For Construction and Utility Workers, it was assumed that the "box" could also be an excavated trench located within the subsurface. The enclosed nature of an excavated trench leads to decreased air exchange and increased soil surface area for fluxing; thus, results in increased potential exposure to subsurface volatiles via inhalation.

The RA Property is expected to undergo redevelopment in the future. The planned presence of paving and other surface materials will restrict the flow of soil gases and the migration of vapours, as concrete materials are much less porous than soil. However, for this exposure modelling, the presence of surface covers was conservatively ignored.

This assessment also employed the following conservative assumptions:

1) The degradation of COCs in the soil vadose zone was not considered if half-lives were not available.
2) The bulk water flow and infiltration of precipitation were ignored, as both of these would tend to retard the migration of vapours upward; therefore, would predict lesser concentrations.

Using the phase partitioning methods described in *Rationale for the Development and Application of Generic Soil, Groundwater and Sediment Criteria for Use at Contaminated Sites in Ontario* (MECP, 1996), COCs in groundwater were used to derive a "total" concentration, including:

- Concentration of a substance in soil gas phase (air)
- Soil water phase (dissolved)
- Soil particle phase (absorbed)

For this assessment, the predicted total concentration in soil based on the groundwater concentration was compared to the estimated maximum concentration in soil, and the greater of these two concentrations was applied to model volatilization to outdoor air. Tables 4-1 and 4-2 summarize the estimated maximum concentrations of volatile COCs in soil and groundwater, respectively.

Table 4-23 shows the predicted outdoor air concentrations (at ground surface and in a trench) determined as a result of the outdoor air calculations.

The receptors identified may be exposed to COCs volatilizing from soil and groundwater into outdoor air. Residents and Outdoor Workers are only exposed at the surface, whereas Construction Workers and Utility Workers would be maximally exposed in an excavation. The estimated dose for each receptor was calculated based on receptor characteristics and was compared with the RfC or UR (if the parameter was a carcinogen, see Section 4.3, Toxicity Assessment), which implies exposure at that concentration would be continuous over the receptors' lifetime (that is, 24 hours a day, 7 days a week, 52 weeks a year for a lifetime).

Table 4-24 presents the predicted exposure to subsurface volatiles in outdoor air for Residents and Workers above ground surface. Table 4-25 presents the predicted exposure to subsurface volatiles in outdoor air for Construction Workers and Utility Workers during time spent in a trench.

4.2.3.7 Exposure Estimates for Pregnant Adult Female Receptor

To assess the potential risk of exposure to developmental toxicants, an adult female receptor was assumed to be exposed continuously, to estimate exposure during Resident, Construction, Outdoor, and Utility[4]; and Indoor Worker scenarios.

The RA identified the following COCs as developmental toxicants:

- Lead
- B[a]P
- TCE
- Vanadium

4.2.4 Uncertainties—Exposure Assessment

Uncertainty exists in the RA's exposure assessment. Onsite receptors were hypothesized and activities assumed to result in exposures. Taken together, Jacobs developed the assumptions to be conservative and likely overestimate the potential exposure and risk:

- The screening process for volatility (Appendix F2) assumes that a chemical is volatile if the H is greater than 1×10^{-5} atm-m^3/mol or the vapour pressure is greater than 1.0 Torricelli (MECP, 2019). Slightly differing definitions of what constitutes a volatile chemical are available. Even if alternate screening criteria were applied and additional parameters identified as volatile, it is not expected to alter the conclusions of the RA.
- Exposure duration and frequencies for workers were assumed to occur on a regular and long-term basis, despite the reasonable potential that receptors may relocate, may change employment and job descriptions, and are unlikely to contact chemicals on a routine basis. The conservative way receptors have been identified and activities evaluated indicates uncertainties in the exposure assessment most likely allow for an overestimate of exposure, which will lead to an overestimation of risk.
- Exposure duration and frequency of exposure for Residents were assumed to occur on a regular and long-term basis (assumed the person would reside on the RA Property approximately 24 hours per day, 7 days per week, 50 weeks per year for a lifetime), despite the reasonable potential that receptors may move during their lifetime. The conservative way receptors have been identified and activities evaluated indicates uncertainties in the exposure assessment most likely allow for an overestimate of exposure, which will lead to an overestimation of risk.
- The exposure assessment section also defines the concentrations to which potential receptors may be exposed. Within the RA Property boundaries, vapour concentrations have been estimated using conservative models that incorporate general fate and transport factors intended to conservatively overestimate vapour concentrations to which exposures might occur. This conservative approach likely results in an overestimate of exposure and associated risk to certain receptors. These assumptions impart uncertainty to the RA but are purposely developed to verify that the RA conclusions are, indeed, conservative and protective of human health. Though the use of some assumptions may result

[4] The exposure assumptions for the Pregnant Female Construction, Outdoor, and Utility Worker are identical for all scenarios except dust inhalation; and the TRVs do not differ for the developmental toxicants identified in this RA (that is, the identified chronic and subchronic TRVs are the same). Therefore, these three receptors have been combined into one column in the exposure and risk tables as "Female Construction, Outdoor, or Utility Worker", where appropriate.

in lowering exposure and risk, the net effect of these uncertainties is that risk to potential receptors has likely been overestimated.

- In the assessment of indoor air, the use of soil concentrations and partitioning calculations to determine soil gas concentrations is not generally accepted for use in evaluating VI because there is a great degree of uncertainty associated with the soil partitioning results (EPA, 2002b), which could lead to over- or underestimating risk.
- Potential vapour concentrations in outdoor air were modelled assuming that receptors were chronically occupying the area of the RA property with the estimated maximum soil and groundwater concentrations. This assumption is conservative; therefore, the predicted exposure to COCs through outdoor air inhalation has likely been overestimated, which will lead to an overestimation of risk.
- Concentrations of contaminants are not uniformly distributed across the RA Property. The estimated maximum values for chemicals in soil and groundwater were used in the modelling. These concentrations appear in localized areas onsite and represent the greatest concentration based on judgmental sampling. Receptors would not consistently be exposed to the maximum concentration present at a site over their ED; therefore, the predicted exposure and risks have likely been overestimated.
- Potential vapour concentrations inside future RA Property buildings were modelled assuming the buildings are occupied and lie directly over the estimated maximum soil and groundwater concentrations detected at the RA Property (only for volatile COCs). This assumption is conservative; therefore, the predicted exposure to COCs through indoor air inhalation has likely been overestimated, which will lead to an overestimation of risk.
- The selected incidental ingestion rates for soil and groundwater may be different than the experimental basis used to develop them (for example, Construction and Utility Worker incidental ingestion of groundwater is based on exposure while swimming and nonincidental contact while working). Changes in ingestion rate would increase or decrease the predicted exposure and risk.
- The daily dermal events and ingestion exposures were hypothesized to have occurred on the RA Property. Some receptors may spend more time in a day not at the RA Property; therefore, these exposures from soil and groundwater have likely been overestimated. This will lead to an overestimation of risk.
- The assessment of exposure to PHC fraction (F)1, F2, F3, and F4 in soil and groundwater was conducted through application of subfraction proportions outlined in *Canada-Wide Standard for Petroleum Hydrocarbons (PHC) in Soil* (CCME, 2008) and *Federal Contaminated Site Risk Assessment in Canada, Part IV* (Health Canada, 2008). These proportions were specifically developed for soil and groundwater; however, Site-specific subfractions proportions may be different. The application of these proportions in the assessment of exposure to PHC in soil and groundwater adds uncertainty to the assessment and could lead to an overestimation or underestimation of exposure and risk to any subfraction grouping.
- The toxicity, mobility, and bioavailability of metals and metalloids in soil generally depend on several soil factors, including the following: pH, redox potential, iron and manganese content, and calcium carbonate content. Interactions between these soil factors can increase or decrease the toxicity, mobility, and bioavailability of these chemicals; however, the extent of the effects is unknown.
- The biodegradation of parent compounds to VC in groundwater is affected by site-specific geochemical parameters (redox potential, pH, and such), microbial activity, and chemical-specific parameters. These parameters can increase or decrease the biodegradation of chlorinated ethylenes to VC. Therefore, adding 10 percent of the parent compounds' maximum concentrations to the maximum VC concentrations may over- or underestimate the exposure to, and risks from, VC at the RA Property.

- The calculation of B(a)PE did not include contributions from methylnaphthalene 2- (1-), naphthalene, or others. Although some evidence of carcinogenicity has been identified for these parameters, it has not been confirmed in all cases, or for all routes of exposure. Accepted TEFs have not been established for these parameters. The exclusion of these parameters from the B(a)PE calculation could lead to an underestimation of exposure to B(a)PE.
- The uptake of vapours through skin was not assessed quantitatively and was considered negligible, compared with exposure of vapours through inhalation. The exclusion of this pathway could lead to an underestimation of exposure and risk.
- Lead was identified as a developmental toxicant for direct contact exposures, but was not assessed quantitatively via the Pregnant Female receptor. The exclusion of this toxicant-receptor scenario could lead to an underestimation of exposure and risk for developmental effects.
- The exposure assessment assumes worker exposure to groundwater would be limited to the hands, since dewatering is a typical construction practice that limits the presence of groundwater in construction areas. Additional body parts, such as forearms, may occasionally be exposed to groundwater, if accidental splashing were to occur. This scenario would increase the potential exposure area; however, an increase in the exposure area is unlikely.
- The Utility Worker receptor represents a worker who would be involved in the maintenance, installation, or repair of subsurface utilities or tunnels at the RA Property. As such, the Utility Worker is anticipated to be onsite full-time for only a limited number of days per year (assumed to be 2 weeks), but could return to the RA Property each year for additional work. The assumption of 2 weeks per year could over- or underestimate exposure in the short-term, but is unlikely to significantly underestimate risk in the long-term.
- The J&E modelling assumes an infinite source and does not account for the degradation of or removal processes for constituents, potentially significantly overestimating indoor air concentrations for soil.

4.3 Toxicity Assessment

This section describes the types of adverse effects a substance can cause following different routes of exposure (for example, ingestion, inhalation, or dermal), and the nature and severity of such effects associated with various levels of exposure, where increased exposure leads to increased risk of adverse effect (that is, dose-response relationship).

4.3.1 Nature of Toxicity (Hazard Assessment)

Two broad categories of adverse effects are considered: (1) threshold effects and (2) nonthreshold effects. For the threshold effect category, a substance is not expected to cause risk of an adverse effect at less than a certain dose (that is, the threshold dose). For nonthreshold effects, it is assumed that a substance may cause an adverse effect at any dose greater than zero. The former category is usually associated with noncancer effects, and the latter category is generally associated with cancer effects.

Chemicals assumed to exhibit threshold-type dose-response relationships exhibit a no-observed-adverse-effect level (NOAEL). At less than this threshold of exposure, the risk of adverse effect is essentially zero. This threshold is the basis for a TRV called a reference dose (RfD), which incorporates the use of safety factors, uncertainty factors (UFs), modifying factors, or a combination thereof. The magnitude of a factor depends on the confidence in the data and study used to derive the NOAEL and to account for inter- and intraspecies differences, EDs, and overall data quality of available data and information. The factors can easily span several orders of magnitude. The analogous exposure limit for airborne chemicals is called an RfC.

Chemicals that exhibit a nonthreshold-type dose-response are assumed to have no adverse effect only when the exposure or dose is zero. This dose-response model is generally applied to genotoxics (affects genetic material in biological cells) and carcinogens (causes cancer). Mathematical modelling is usually required to extrapolate cancer risk from animal studies to hypothetical human exposures. For chemicals that exhibit nonthreshold-type hazards, slope factors (SFs) and URs are used to determine the incremental lifetime cancer risk (ILCR) from exposure.

Many chemicals exhibit both types of dose-response relationships, exhibiting different adverse-effect end-points. Some COCs that are the subject of this assessment are assumed to have shown both threshold and nonthreshold adverse effects.

The following definitions have been extracted from the EPA's Integrated Risk Information System (IRIS) documentation (EPA, 2016a,b):

- **Reference Concentration (RfC):** An estimate (with uncertainty spanning perhaps an order of magnitude) of a continuous inhalation exposure to the human population (including sensitive subgroups) that is likely to be without an appreciable risk of deleterious effects during a lifetime. It can be derived from a NOAEL, lowest-observed-adverse-effect level (LOAEL), or benchmark concentration, with UFs generally applied to reflect limitations of the data used. This estimate is generally used in EPA's noncancer health assessments.
- **Reference Dose (RfD):** An estimate (with uncertainty spanning perhaps an order of magnitude) of a daily oral exposure to the human population (including sensitive subgroups) that is likely to be without an appreciable risk of deleterious effects during a lifetime. It can be derived from a NOAEL, LOAEL, or benchmark dose, with UFs generally applied to reflect limitations of the data used. This estimate is generally used in the EPA's noncancer health assessments.
- **Slope Factor (SF):** An upper bound, approximating a 95 percent confidence limit, on the increased cancer risk from a lifetime exposure to an agent. This estimate, usually expressed in units of proportion (of a population) affected per mg/kg/d, is generally reserved for use in the low-dose region of the dose-response relationship (that is, for exposures corresponding to risks less than 1 in 100).
- **Unit Risk (UR):** The upper-bound excess lifetime cancer risk estimated to result from continuous exposure to an agent at a concentration of 1 µg/L in water or 1 µg/m^3 in air. The interpretation of UR would be as follows: if UR = 1.5 × 10^{-6} µg/L, 1.5 excess tumours are expected to develop per 1,000,000 people if exposed daily for a lifetime to 1 µg of the chemical in 1 L of drinking water.

Chemical-specific toxicity profiles in Appendix H include a description of the hazard assessment indicating the potential adverse health effects from exposure to the COCs in this assessment.

4.3.2 Dose Response Assessment

The TRVs were obtained from regulatory agencies, including the MECP and EPA (IRIS). Other TRVs cited in the Rationale Document (MECP, 2011b), such as those developed by the California Environmental Protection Agency, Office of Environmental Health Hazard Assessment, the Agency for Toxic Substances and Disease Registry, the Netherlands National Institute of Public Health and Environmental Protection, or the World Health Organization, were also considered. TRVs were obtained from published toxicity databases. If a database did not have a published value, an alternate source was reviewed. The TRVs used from other credible jurisdictions (as listed) meet the requirements as set out in Section 4.3.2 of *Procedures for the Use of Risk Assessment under Part XV.1 of the Environmental Protection Act* (MECP, 2005).

Noncarcinogenic TRVs (that is, RfDs and RfCs) can be based on several different toxicological end-points, including systemic effects, developmental toxicity, neurotoxicity, and reproductive effects. Typically, the

most sensitive end-point is selected for the derivation of the TRV (that is, the end-point associated with the least of the available LOAELs). Thus, the noncarcinogenic TRVs can generally be considered protective of all toxicological end-points. Furthermore, because a UF is typically applied during the TRV derivation process to account for intraspecies differences, the noncarcinogenic TRVs can generally be considered protective of all receptors (that is, including sensitive subgroups within the human population). Taken together, the noncarcinogenic TRVs can be viewed as protective of all toxicological end-points and all receptors, including, for example, developmental toxicity and pregnant women.

Table 4-26 lists the TRVs used in this RA and also briefly describes the potential health effects on human receptors associated with their exposure to those contaminants. There is great confidence that the TRVs selected for this assessment are relevant and protective of human health. RfDs and RfCs used in this assessment are considered protective of the human population (including sensitive subgroups) at continuous exposure levels (that is, 24 hours per day, 7 days per week). The human receptors identified in the problem formulation are likely to have exposure that is less continuous (that is, 40-hour work week); therefore, the RA provides another layer of conservatism. Similarly, URs and SFs used herein were derived by their respective agencies to account for continuous exposure.

Where more than one TRV is presented in Table 4-26 for the same route and effect (that is, threshold or nonthreshold) the available TRVs were applied as follows:

- **Sub-chronic TRVs** - Where available, sub-chronic TRVs (RfD and RfC) were applied only to the Construction Worker receptor.
- **Vinyl Chloride** - Two sets of carcinogenic TRVs (SF and URF) were selected for vinyl chloride. The TRVs specific to "continuous lifetime exposure from birth" were applied to the Composite Resident receptor for residential exposures, while the TRVs specific to "continuous lifetime exposure during adulthood" were applied to the Indoor Worker, Construction Worker, and Utility Worker receptors for job-related exposures (as these receptors are assumed to be adults per Section 4.2.1).

Chemicals with RfD and RfC TRVs are considered to have "threshold-acting" characteristics, while those with SFs and URs are considered to exhibit carcinogenic or nonthreshold characteristics. Contaminants with both RfD and RfC and SF and UR TRVs have been identified by the reporting regulatory agency as a chemical that can exhibit both types of health effects.

Appendix H presents toxicity profiles, which include a description of the chemical, health effects, assessment of carcinogenicity, and basis of the selected TRV for the chemicals and TRVs not presented in the Rationale Document (MECP, 2011b) or in the updated TRVs provided by the MECP (Pagliarulo, 2017, pers. comm.; Blok, 2018, pers. comm).

For the assessment of Pregnant Female Workers, the following COCs were identified as developmental toxicants:

- Lead
- B[a]P
- TCE
- Vanadium

There are uncertainties associated with the available TRVs for lead, which may not consider the potential adverse health effects at blood lead levels (BLLs) less than the current Canadian BLL intervention level of 10 micrograms per decilitre (µg/dL). As a result, the RA has not quantitatively assessed exposure and risk to lead via the direct contact route. Lead has also been identified as a developmental toxicant, but risk was

not assessed quantitatively for the Pregnant Female receptor, as no TRV protective of developmental effects to a foetus are available.

4.3.3 Uncertainties—Toxicity Assessment

Without exception, the toxicity indices employed in this RA have been developed in a conservative fashion to facilitate the protection of human health, as follows:

- Indices, such as cancer SFs and noncancer RfDs, are intentionally developed to be protective of human health. Cancer SFs are developed assuming that a threshold for effects does not exist. RfDs are frequently derived using several UFs (ranging from 1 to 10) and modifying factors (ranging from 10 to 10,000) that, in effect, lessen the dose responsible for the toxic effects. Furthermore, additional modifying factors are applied, depending on the confidence level of the database used to derive a toxicity limit. If confidence is low (that is, because of limited information, variations within the test species populations, or differences between the test species and humans), the factor applied is relatively high and accounts for the lack of knowledge.
- Jacobs built in an additional consideration of uncertainty into this RA by including a separate developmental toxicity-based TRV evaluation for a Pregnant Female receptor exposure scenario.
- Jacobs evaluated PAHs for nonthreshold (carcinogenic) effects if they were identified to have carcinogenicity or genotoxicity, or both, as described by EPA, and International Programme on Chemical Safety (WHO, 1998) classifications for this group of chemicals. The aromatic PAHs were not identified as genotoxic or carcinogenic chemicals, do not have common mechanisms of action to cause toxicity as the carcinogenic PAHs, or do not have a well-established TEF. Therefore, Jacobs did not include them in its TEF approach for B(a)PE estimations; however, the uncertainty associated with the risk estimation for the B(a)PE is likely to be minimal.
- The evaluation of B(a)PE assumes that the toxicological endpoint for all identified carcinogenic PAHs are the same as B(a)P. This may result in an under or over estimation of potential risks associated with exposure to carcinogenic PAHs.
- The MECP uses route-to-route extrapolation to derive an RfC value, typically from RfD values for chemicals without readily published RfC values. Additionally, Jacobs conducted a literature search for RA Property COCs to identify published RfC values from other agency guidance documents. Table 4-26 lists the identified selected TRVs. However, some chemicals did not have RfC values because such chemicals are not an inhalation exposure concern, most likely due to low volatility or lack of toxicity through inhalation route of exposure. Thus, uncertainty associated with the absence of RfC or URF values for such chemicals is considered minimal.
- Over time, as more information from studies and research become available, toxicological information for constituents is updated. As a result, TRVs are expected to change over time. If TRVs are updated, changed, or added, they could inherently change the estimated risk.
- Due to uncertainties associated with the available TRVs for lead, which may not consider the potential adverse health effects at BLLs less than the current Canadian BLL intervention level of 10 µg/dL, Jacobs has not quantitatively assessed exposure and risk to lead via the direct contact or inhalation exposure routes in this RA. Lead has also been identified as a developmental toxicant but was not assessed quantitatively via the Pregnant Female receptor, as no TRV protective of developmental effects to a foetus is available.
- In the absence of TRVs developed specifically for intermittent exposures, Jacobs adopted chronic TRVs to assess risks to the Utility Worker. This may result in an under or over estimation of potential risks to this receptor.

4.4 Risk Characterization

4.4.1 Interpretation of Health Risks

The risk characterization stage integrates the results of the exposure assessment with the information obtained during the toxicity analysis. Jacobs derived risk estimates for noncarcinogens (threshold toxicity response) by comparing the exposure intake results to the TRVs.

A comparison of the estimated exposure and estimated air concentration for each chosen substance to the appropriate RfD and RfC, respectively, will provide an estimate of the potential health risk associated with each. If the modelled exposure or air concentrations are less than the appropriate RfD or RfC, adverse health impacts are not expected. The comparison estimates are as described by the following ratios:

$$Exposure\ Ratio = \frac{Predicted\ Exposure\ Rate}{Reference\ Dose\ (RfD)} \quad (12)$$

or

$$Exposure\ Ratio = \frac{Predicted\ Air\ Concentration}{Reference\ Concentration\ (RfC)} \quad (13)$$

Exposure ratios (ERs) are also referred to as hazard quotients (HQs). The MECP considers an ER or HQ of 0.2 to be acceptable for any one environmental medium, if multimedia exposure is possible (MECP, 2011b). The target HQ used in this assessment for all COCs except PHC and TCE (for inhalation only) was 0.2. The target HQ for PHC fractions and TCE (inhalation only) was 0.5 (CCME, 2008; MECP 2016b). MECP (2016b) guidance states that an HQ of 0.5 is acceptable for "TCE exposure inhalation of indoor air (and possibly also outdoor air)" because intake of TCE from other pathways (that is, ingestion in food, groundwater, and soil; and dermal contact with soil) is negligible in comparison (for non-potable sites). It is the QPRA's opinion that the HQ of 0.5 for TCE is also appropriate to apply to the outdoor air inhalation pathway because inhalation (in general terms) is the primary route of exposure to TCE where a potable groundwater use is not present. It is noted that the RA Property has a potable groundwater condition, and therefore, the use of the HQ of 0.5 would typically not be acceptable. However, while groundwater is considered potable in general, impacted groundwater at the Site is not used as a potable resource. RMMs are included in Section 7 to prevent potable water use from RA Property groundwater. As such, the use of the HQ of 0.5 for TCE (for inhalation pathways only) is considered appropriate for the assessment.

The MECP (2011b) HQ of 0.2 is equal to one-fifth of the applicable noncancer TRV. The RfD and RfC define either the exposure rate or concentration of chemical in air that humans, including sensitive individuals, may be exposed to over a lifetime without an appreciable risk of experiencing an adverse effect (which is equivalent to an HQ of 1.0 [EPA, 2000]). If HQs are shown to be greater than 1.0, this does not imply that an adverse effect will result, only that there is a potential for an adverse effect. Because of the conservative nature of the assumptions underlying the calculation of exposure and air concentrations, there is an inherent tendency to overpredict exposure. Furthermore, the scientific principles employed to derive RfD and RfC values are based on selecting the most sensitive end-point observed in the most sensitive gender of the most sensitive species and consider uncertainties in the toxicology assessment database. Overall, these TRVs are expected to be protective of human health.

UFs that span several orders of magnitude (for example, often 1,000-fold or greater) are placed on dose-response models in animal toxicity studies to protect human health. Often, the TRV is developed from the NOAEL in animal studies, which is a dose that does not cause harm to an animal. The greater the uncertainty

in the toxicological study, the larger the UF that is employed. Taken together, the overprediction of exposure and the minimization of the toxicity value provide a comprehensive approach to the protection of human health and the environment.

Estimates of risk for carcinogens (nonthreshold response) are derived by the following relationship, where the ILCR is calculated:

$$ILCR = Exposure\ Estimate \times Cancer\ SF \quad (14)$$

or

$$ILCR = Exposure\ Concentration \times UR \quad (15)$$

For the ILCR, values between 1×10^{-6} and 1×10^{-4} are typically considered to be a negligible increase of risk. The MECP has selected a target ILCR of 1×10^{-6} (1 in 1 million) as the acceptable level of risk, which was used in this assessment.

Based on the hazard assessment, some COCs may act toxicologically the same or in a similar manner on biological systems (that is, carcinogenic PAHs or chlorinated volatile organic compounds [cVOCs]). For this RA, Jacobs calculated the cumulative risk for PAHs in soil and groundwater and cVOCs in groundwater to conservatively address the potential for exposure to these groups of substances.

4.4.2 Quantitative Interpretation of Health Risks

4.4.2.1 Dermal Contact with Soil

Table 4-27 shows the predicted risks from dermal contact with soil. Risks to Site Visitors and Indoor Workers were indirectly assessed through the modelling for onsite Residents and Outdoor Workers, respectively (refer to Section 4.4.3.1). Risks were estimated to exceed the MECP target risks as follows:

Receptor	Exceeds MECP Target Noncancer Risk	Exceeds MECP Target Cancer Risk
Resident	• B(a)P • Copper • Iron • Zinc • PHC F3	• Arsenic • Benzo(a)anthracene • B(a)P • Benzo(b)fluoranthene • Benzo(k)fluoranthene • Dibenzo(a,h)anthracene • Fluoranthene • Indeno(1,2,3-Cd)Pyrene • B(a)PE
Outdoor Worker	• B(a)P	• Arsenic • Benzo(a)anthracene • B(a)P • Benzo(b)fluoranthene • Benzo(k)fluoranthene • Dibenzo(a,h)anthracene • Fluoranthene • Indeno(1,2,3-Cd)Pyrene • B(a)PE
Construction Worker	• None	• B(a)P • B(a)PE

Receptor	Exceeds MECP Target Noncancer Risk	Exceeds MECP Target Cancer Risk
Utility Worker	• None	• Arsenic • B(a)P • B(a)PE
Pregnant Female Resident	• B(a)P	• Not applicable
Pregnant Female Worker (Outdoor, Construction, or Utility)	• None	• Not applicable

Based on the assessment of risks from dermal contact with soil, risks greater than the target cancer risk are possible. RMMs are, therefore, required to reduce the potential risks to acceptable levels. Jacobs did not conduct a quantitative assessment of lead in soil; Section 4.4.3.5 provides the qualitative assessment.

4.4.2.2 Dermal Contact with Groundwater

Table 4-28a shows the predicted risks from Resident dermal contact with groundwater as potable drinking water. Table 4-28b shows the predicted risk from Construction and Utility Worker dermal contact with groundwater while working in the subsurface. Risks to Site Visitors and Indoor Workers were indirectly assessed through the modelling for onsite Residents (refer to Section 4.4.3.1). Risks to offsite receptors (that is, offsite Construction and Utility Workers) were indirectly assessed through the modelling for onsite Construction and Utility Workers (refer to Section 4.4.3.2).

For potable groundwater, risks were estimated to exceed the MECP target risks as follows:

Receptor	Exceeds MECP Target Noncancer Risk	Exceeds MECP Target Cancer Risk
Resident	• 2-(1-)Methylnaphthalene • Benzene • B(a)P • Cis-1,2-dichloroethene • Fluoranthene • Phenanthrene • Pyrene • TCE • VC • PHC F2 • PHC F3	• Acenaphthene • Arsenic • Benzene • Benzo(a)anthracene • B(a)P • Benzo(b+j)fluoranthene • Benzo(k)fluoranthene • Chrysene • Fluoranthene • Pyrene • TCE • VC • B(a)PE
Pregnant Female Resident	• B(a)P • TCE	• Not applicable

For incidental contact with groundwater, risks were estimated to exceed the MECP target risks as follows:

Receptor	Exceeds MECP Target Noncancer Risk	Exceeds MECP Target Cancer Risk
Construction Worker	• TCE • PHC F2 • PHC F3	• B(a)P • TCE VC • B(a)PE
Utility Worker	• PHC F2 • PHC F3	• B(a)P

		• TCE VC • B(a)PE
Pregnant Female Worker (Construction or Utility)	• TCE	• Not applicable

Based on the assessment of risks from dermal contact with groundwater (drinking water and incidental), risks greater than the target cancer risk are possible. RMMs are, therefore, required to reduce the potential risks to acceptable levels. Jacobs did not conduct a quantitative assessment of lead in groundwater; Section 4.4.3.5 provides the qualitative assessment.

4.4.2.3 Uncertainties—Dermal Contact

Uncertainties related to the estimation of dermal exposure and risk are as follows:

- The relative DAF and SAFs may be different than the experimental basis used to develop them. This may over- or underestimate the risk.
- The model does not account for the removal of soil contaminants from the receptors' hands by brushing off or washing them off. This may overestimate the risk from exposure.
- Concentrations of contaminants are not distributed uniformly across the RA Property. The estimated maximum detected values for chemicals in soil and groundwater were used in the modelling. These concentrations may appear in localized areas on the RA Property and represent the greatest concentration based on judgmental sampling. Receptors would not consistently be exposed to the maximum concentration present at a site over their lifetime; therefore, the predicted risks have likely been overestimated.
- Site users were assumed to have access to the maximum detected concentrations of chemicals (regardless of depth) on an ongoing and constant basis. Under normal circumstances, only a Construction or Utility Worker would have access to soil located at depths impacted with COCs at maximum detected concentrations.
- The exposure assessment assumes worker exposure to groundwater would be limited to the hands. Additional body parts, such as forearms, may occasionally be exposed to groundwater, increasing potential exposure area; however, a significant increase in the exposure area is unlikely.
- The likelihood is low that Construction or Utility Workers would have their hands submerged continuously in groundwater even for one 5-minute event per day for the duration of the construction period. Typical construction activities include the dewatering of excavations. Therefore, it is unlikely that these receptors would have significant exposure to groundwater when using typical construction practices.
- The K_p used in this RA has uncertainty and could overestimate exposure for highly lipophilic compounds and underestimate exposure from other organic compounds, such as chlorinated compounds. The risk estimates could be higher or lower. Peer-reviewed estimates of chemical physical properties were used where available.

4.4.2.4 Incidental Ingestion of Soil

Table 4-29 shows the predicted risks from incidental ingestion of soil. Risks to Site Visitors and Indoor Workers were indirectly assessed through the modelling for onsite Residents and Outdoor Workers, respectively (refer to Section 4.4.3.1). Risks were estimated to exceed the MECP target risks as follows:

Receptor	Exceeds MECP Target Noncancer Risk	Exceeds MECP Target Cancer Risk
Resident	• Arsenic • B(a)P • Cadmium • Cobalt • Copper • Iron • PCB, Total • Thallium • TCE • Vanadium • Zinc • PHC F3	• Arsenic • Benzo(a)anthracene • B(a)P • Benzo(b)fluoranthene • Benzo(k)fluoranthene • Chrysene • Dibenzo(a,h)anthracene • Fluoranthene • Indeno(1,2,3-cd)pyrene • TCE • B(a)PE
Outdoor Worker	• B(a)P • Cadmium • Cobalt • Thallium	• Arsenic • Benzo(a)anthracene • B(a)P • Benzo(b)fluoranthene • Benzo(k)fluoranthene • Chrysene • Dibenzo(a,h)anthracene • Fluoranthene • Indeno(1,2,3-cd)pyrene • B(a)PE
Construction Worker	• Cadmium	• Arsenic • B(a)P • B(a)PE
Utility Worker	• None	• Arsenic • B(a)P • B(a)PE
Pregnant Female Resident	• B(a)P •	• Not applicable
Pregnant Female Worker (Outdoor, Construction, or Utility)	• None	• Not applicable

Based on the assessment of risks from incidental ingestion of soil, risks greater than the target cancer and noncancer risks are possible. RMMs are, therefore, required to reduce the potential risks to acceptable levels. Jacobs did not conduct a quantitative assessment of lead in soil; Section 4.4.3.5 provides the qualitative assessment.

4.4.2.5 Ingestion of Groundwater

Table 4-30a shows the predicted risks from Resident ingestion of RA Property groundwater as potable drinking water. Table 4-30b shows the predicted risks from Construction and Utility Worker incidental ingestion of groundwater while working in the subsurface. Risks to Site Visitors and Indoor Workers were indirectly assessed through the modelling for onsite Residents (refer to Section 4.4.3.1). Risks to offsite receptors (that is, offsite Construction and Utility Workers) were indirectly assessed through the modelling for onsite Construction and Utility Workers (Section 4.4.3.2).

For potable water, risks were estimated to exceed the MECP target risks as follows:

Receptor	Exceeds MECP Target Noncancer Risk	Exceeds MECP Target Cancer Risk
Resident	• 2-(1-)Methylnaphthalene • Arsenic • Benzene • B(a)P • Cis-1,2-dichloroethene • Phenanthrene • Trans-1,2-dichloroethene • TCE • Zinc • VC • PHC F2 • PHC F3 • PHC F4	• 1,1-dichloroethane • Acenaphthene • Arsenic • Benzene • Benzo(a)anthracene • B(a)P • Benzo(b+j)fluoranthene • Benzo(k)fluoranthene • Chrysene • Fluoranthene • Pyrene • TCE • VC • B(a)PE
Pregnant Female Resident	• B(a)P • TCE •	• Not applicable

For incidental ingestion, risks were estimated to exceed the MECP target risks as follows:

Receptor	Exceeds MECP Target Noncancer Risk	Exceeds MECP Target Cancer Risk
Construction Worker	• TCE • PHC F2 • PHC F3	• Arsenic • TCE • VC
Utility Worker	• TCE • PHC F3	• Arsenic • TCE • VC
Pregnant Female Worker (Construction or Utility)	• TCE	• Not applicable

Based on the assessment of risks from ingestion of groundwater (drinking water and incidental), risks greater than the target cancer and noncancer risks are possible. RMMs are, therefore, required to reduce the potential risks to acceptable levels. Jacobs did not conduct a quantitative assessment of lead in groundwater; Section 4.4.3.5 provides the qualitative assessment.

4.4.2.6 Uncertainties—Ingestion

Uncertainties related to the estimation of ingestion exposure and risk are as follows:

- The amount of water assumed to be ingested by Construction and Utility Workers in this assessment is equivalent to the amount considered to be ingested during swimming activities (50 millilitres [mL], based on EPA [1989]). The actual ingestion of groundwater is likely to be insignificant. The assumption will likely overestimate the risk to Construction and Utility Workers.

- Typical construction activities include dewatering excavations; therefore, it is unlikely that Construction or Utility Workers will be exposed to groundwater. Less exposure will result in lesser risk estimates.
- Concentrations of contaminants are not uniformly distributed across the RA Property. The estimated maximum detected values for chemicals in soil and groundwater were used in the modelling. These concentrations appear in localized areas on the RA Property and represent the greatest concentration based on judgmental sampling. Receptors would not consistently be exposed to the maximum concentration present at a site over their lifetime; therefore, the predicted risks have likely been overestimated.
- Site users were assumed to have access to the maximum detected concentrations of chemicals (regardless of depth) on an ongoing and constant basis. Under normal circumstances, only a Construction or Utility Worker may have access to soil or groundwater deep enough to be impacted with COCs at maximum detected concentrations.
- The incidental ingestion rates may be different than the experimental basis used to develop them. Changes in ingestion rate would increase or decrease the predicted risk.

4.4.2.7 Summary of Direct Contact (Dermal and Ingestion) with Soil

Table 4-31 shows the calculated combined risk from dermal contact and ingestion with soil. Adding the two exposure pathways resulted in the addition of the following COCs and receptors with risks greater than MECP target levels:

- Phenanthrene, PHC F2, and PHC F4 exceed the target noncancer risk for the Toddler Resident
- TCE exceeds the target cancer risk and copper and iron exceed~~ing~~ the noncancer risk for the Outdoor Worker.
- Benzo(b)fluoranthene and dibenzo(a,h)anthracene exceed the target cancer risk for the Utility Worker.
- Copper, iron, and zinc exceed the target noncancer risk for the Construction Worker.

Risks associated with dust were not included in Table 4-31. This is because the risks associated with dust inhalation are minor compared to the dermal or ingestion pathways. While there is uncertainty associated with excluding dust from these tables, its inclusion does not affect the conclusions of the assessment or the RMMs required for the RA Property. Section 4.4.3.8 provides a qualitative assessment of inhaled soil particulates that are ingested.

4.4.2.8 Summary of Direct Contact (Dermal and Ingestion) with Groundwater

Tables 4-32a and 4-32b show the calculated combined risk from dermal contact and ingestion with groundwater for the RA Property for potable water by Residents and subsurface contact by Workers, respectively. Adding the two exposure pathways resulted in the addition of the following COCs and receptors with risks greater than MECP target levels:

- Fluoranthene exceeds the target noncancer risk for the Infant Resident
- Trans-1,2-dichloroethene exceeds the target noncancer risk for the Child Resident.
- Phenanthrene and pyrene exceed the target noncancer risk for the Adult Resident.

4.4.2.9 Inhalation of Fugitive Dust

Table 4-33 shows the predicted risks from inhalation of particulates (dust) originating from RA Property soil both during construction activities and following redevelopment. Risks were estimated to exceed the MECP target risks as follows:

Receptor	Exceeds MECP Target Noncancer Risk	Exceeds MECP Target Cancer Risk
Resident	• None	• None
Outdoor Worker	• None	• None
Construction Worker	• B(a)P • Cobalt • Zinc	• None
Utility Worker	• None	• None
Pregnant Female Resident	• None	• Not applicable
Pregnant Female Worker (Outdoor)	• None	• Not applicable
Pregnant Female Worker (Construction or Utility)	• B(a)P	• Not applicable

Based on the assessment of risks from inhalation of particulates (dust), risks greater than the target noncancer risks are possible for pregnant subsurface workers during construction activities. RMMs are, therefore, required during construction activities to reduce the potential risks to acceptable levels.

It was not possible to quantitatively assess lead or iron for the dust inhalation pathway due to a lack of toxicity criteria for ~~this~~ these parameters. For ~~lead~~these COCs, the background soil values are considered appropriate to determine whether concentrations at the RA Property may pose a greater risk to human health than that expected at an Ontario property that has not been impacted by anthropogenic activities (refer to Section 4.4.3.5 for a qualitative analysis). Based on the qualitative analysis of lead and iron, RMMs are also required to reduce the potential risks from ~~lead~~ exposure to these COCs to acceptable levels.

4.4.2.10 Uncertainties—Dust Inhalation

Uncertainties related to the estimation of dust inhalation exposure and risk are as follows:

- Inhalation RfDs and URs were derived from RfCs and URFs using a default inhalation rate of 20 cubic metres per day (m^3/d) and a BW of 70 kg to assess risks from dust inhalation as a dose. This conversion is specific to adults; therefore, risks from dust inhalation may be underestimated for nonadult receptors. However, since an elevated risk is already estimated for the pathway, the conclusion that RMMs are required is not affected by this uncertainty.
- Risk to offsite receptors would likely be less than experienced by Site users, since the concentration of COC-impacted fugitive dusts diminishes rapidly with dispersion and dilution in air and with distance (EPA, 2002a).
- The total dust in the air is highly variable; as a result of the uncertainty in the dust concentrations, Jacobs used a conservative value, likely resulting in an overestimate of exposure and risk.
- A suitable noncancer TRV for inhalation of lead and iron are~~is~~ not currently available; therefore, Jacobs could not estimate the noncancer inhalation risks from lead and iron in dust. As RMMs are required for this pathway for other COCs, the potential for noncancer risks greater than MECP targets from lead in dust will be managed as part of the RMP.

4.4.2.11 Inhalation of Indoor Air

Tables 4-34a and 4-34b show the predicted risks from inhalation of vapours migrating from soil to indoor air for all retained receptors under commercial building and residential building scenarios, respectively.

For the generic commercial building soil to indoor air scenario, risks were estimated to exceed the MECP target risks as follows:

Receptor	Exceeds MECP Target Noncancer Risk	Exceeds MECP Target Cancer Risk
Indoor Worker	• Benzene • Naphthalene • TCE • PHC F2	• Benzene • TCE
Pregnant Female Indoor Worker	• TCE	• Not applicable

For the generic residential building soil to indoor air scenario, risks were estimated to exceed the MECP target risks as follows:

Receptor	Exceeds MECP Target Noncancer Risk	Exceeds MECP Target Cancer Risk
Resident	• Benzene • Mercury • Naphthalene • PHC F2 • TCE • Xylenes, total	• Acenaphthene • Benzene • TCE
Pregnant Female Resident	• TCE	• Not applicable

Tables 4-35a and 4-35b show the predicted risks from inhalation of vapours migrating from groundwater to indoor air for all retained receptors under commercial building and residential building scenarios, respectively.

For the generic commercial building groundwater to indoor air scenario, risks were estimated to exceed the MECP target risks as follows:

Receptor	Exceeds MECP Target Noncancer Risk	Exceeds MECP Target Cancer Risk
Indoor Worker	• Benzene • 1,1-dichloroethene • Cis-1,2-dichloroethene • Trans-1,2-dichlorothene • n-hexane • TCE • VC • PHC F1 • PHC F2	• Benzene • 1,1-dichloroethane • TCE • VC

Pregnant Female Indoor Worker	• TCE	• Not applicable

For the generic residential building groundwater to indoor air scenario, risks were estimated to exceed the MECP target risks as follows:

Receptor	Exceeds MECP Target Noncancer Risk	Exceeds MECP Target Cancer Risk
Resident	• Benzene • 1,1-dichloroethane • 1,1-dichloroethene • Cis-1,2-dichloroethene • Trans-1,2-dichlorothene • n-hexane • (2-)1-Methylnaphthalene • Naphthalene • Tetrachloroethylene • 1,1,1-trichloroethane • TCE • VC • PHC F1 • PHC F2	• Acenaphthene • Benzene • 1,1-Dichloroethane • Tetrachloroethylene • TCE • VC
Pregnant Female Resident	• TCE	• Not applicable

Based on the assessment of risks from inhalation of vapours in indoor air originating from soil and groundwater for the modelled building scenarios, unacceptable risks are possible for the generic commercial and residential building scenarios. RMMs are, therefore, required to reduce the potential risks to acceptable levels for the generic commercial and residential building scenarios.

4.4.2.12 Uncertainties—Indoor Air

Uncertainties related to the estimation of inhalation exposure and risk are as follows:

- The degradation of organic compounds along the transport path was ignored. If degradation was included, the chemical concentration would decrease, which would decrease the estimated risks.
- For indoor air assessments, it is not generally acceptable to use soil concentrations and partitioning calculations to determine soil gas concentrations while evaluating VI because there is a great degree of uncertainty associated with the soil-partitioning results (EPA, 2002b), which could lead to over- or underestimating risk.
- The exposure assessment section also defines the concentrations of COCs to which potential receptors may be exposed. Within the RA Property boundaries, Jacobs estimated potential indoor air vapour concentrations by using conservative models that incorporate general fate and transport factors intended to conservatively overestimate vapour concentrations to which a receptor might be exposed. The selection of conservative assumptions regarding Site-specific inputs may result in an overestimate of exposure and associated risk to certain receptors. These assumptions all impart uncertainty to the

RA but are purposely developed to yield RA conclusions that are, indeed, conservative and protective of human health.

- Vapour concentrations inside future RA Property buildings were modelled assuming the buildings are occupied, and the VI pathway is complete, meaning soil vapours can enter the structure. This assumption is conservative because the exposure pathway may not actually be complete or significant; therefore, there may be no or little associated risk.
- Exposure modelling for indoor air conservatively assumes the structure lies directly over the estimated maximum soil and groundwater concentrations for volatile COCs detected at the RA Property. It is also assumed that the source is infinite, and the modelling does not account for degradation of constituents. These factors may significantly overestimate indoor air concentrations and risk.
- A source of uncertainty in indoor air vapour concentration model results is the use of partitioning coefficients from other media into soil vapour to predict subslab soil vapour concentrations of COCs and, in turn, to assess potential indoor air concentrations. Modelling results based on ideal chemical properties of the COCs may not appropriately represent true portioning between media that occurs on a site-specific basis. This results in uncertainty in the model results that could over- or underestimate risk.

4.4.2.13 Inhalation of Outdoor Air Volatiles

Table 4-36 shows the predicted risk for Residents and Workers from inhalation of subsurface volatiles migrating to outdoor air above the ground surface at the RA Property. Risks to each receptor were estimated to be less than the MECP target noncancer and cancer risks for the retained COCs. RMMs are, therefore, not required at the RA Property to reduce the potential risks to acceptable levels. Risks to onsite Indoor Workers and offsite receptors (that is, offsite Surface Receptors, and Construction and Utility Workers) were indirectly assessed through the modelling for onsite Residents and Workers (Sections 4.4.3.1 and 4.4.3.2).

Table 4-37 shows the predicted risk for Utility and Construction Workers from inhalation of subsurface volatiles migrating to outdoor air in an excavated trench for the RA Property. Risks were estimated to exceed the MECP target risks as follows:

Receptor	Exceeds MECP Target Noncancer Risk	Exceeds MECP Target Cancer Risk
Construction Worker	• Naphthalene • TCE • PHC F2	• None
Utility Worker	• None	• None
Pregnant Female Worker (Construction or Utility)	• TCE	• Not applicable

RMMs are required during excavation activities at the RA Property to reduce the potential risks to acceptable levels.

Table 4-38 shows the combined predicted risk for Utility and Construction Workers from the inhalation of subsurface volatiles migrating to outdoor air above ground surface and in an excavated trench. Adding the two pathways did not result in any COCs exceeding the MECP target risk levels for any receptor.

4.4.2.14 Uncertainties—Outdoor Air Volatiles Inhalation

Uncertainties related to the estimation of outdoor air inhalation exposure and risk are as follows:

- The comparators used to predict risk (that is, RfC and UR) are values considered protective of lifetime exposure to chemicals—24 hours per day, 7 days per week, 52 weeks per year, for 70 years—and include adjustments for sensitive individuals in the human population. Therefore, for any human receptor, risks are overestimated for short-term exposure to volatile chemicals that may be present in air, since no person will occupy the RA Property for a duration consistent with the duration used to develop the comparators. Adjustment of the comparator for shortened duration would likely result in a decreased risk for receptors.
- Risk to offsite receptors, included Residents, would likely be less than experienced by Site users, since the concentration of volatile COCs in air diminishes with dispersion and dilution in air rapidly with distance (EPA, 2002a).
- As outline in Appendix G3, outdoor air concentrations in a trench have been modelled based on an assumed wind speed and the assumed presence of a worker in a trench. Actual concentrations may be under- or overestimated. However, typical practices for trench excavation prohibit entry because the trench is considered a confined space. Therefore, exposure estimates are likely to overestimate risks in this case.

4.4.3 Qualitative Interpretation of Health Risks

This section discusses parameters and exposure scenarios that were qualitatively assessed in the HHRA.

4.4.3.1 Qualitative Assessment of Additional Onsite Receptors

Site Visitors of all ages may also be present at the RA Property under future conditions. These receptors may also be exposed to RA Property impacts; however, their exposure will be less than that of the receptors included for quantitative assessment. Similarly, Indoor Workers were not included for quantitative assessment for pathways other than indoor air inhalation, because they have less exposure to outdoor air and direct contact with Site soils relative to a full-time Outdoor Worker. It is understood that if risks to the quantitatively evaluated receptors are identified, risks to these onsite receptors are also possible through relevant exposure pathways.

The following risk conclusions have been made for quantitatively evaluated receptors and are understood to possibly exist for the qualitatively evaluated onsite receptors:

- Unacceptable risks from direct contact with soil are possible for Indoor Workers, Site Visitors, and for non-Toddler Residents (infant, child, teen, and adult).
- Unacceptable risks from incidental ingestion of soil are possible for Indoor Workers, Site Visitors, and non-Toddler Residents (infant, child, teen, and adult).
- Unacceptable risks from ingestion of groundwater as potable water are possible for Indoor Workers and ingestion of drinking water for Site Visitors and non-Toddler Residents (infant, child, teen, and adult) and Indoor Workers.
- Unacceptable risks from inhalation of volatiles in outdoor air above ground are not expected for Indoor Workers, Site Visitors, and non-Toddler Residents (infant, child, teen, and adult).
- Unacceptable risks from dust inhalation are possible for non-Toddler Residents, Site Visitors, and Indoor Workers from lead and iron.

4.4.3.2 Qualitative Assessment of Offsite Receptors

Offsite receptors may also be exposed to Site media if impacted soil particulates, vapours, or groundwater migrates beyond the RA Property boundaries; however, their exposure will be less than that of the onsite receptors included for quantitative assessment. If risks to the quantitatively evaluated onsite receptors are identified, then risks to these offsite receptors are also possible through relevant exposure pathways.

The following risk conclusions have been made for quantitatively evaluated onsite receptors (Section 4.4.2) and are understood to possibly exist for the qualitatively evaluated offsite receptors should offsite migration of dust (from onsite soils) or groundwater occur:

- Unacceptable risks from dust inhalation are possible for offsite Surface Receptors from lead and iron, offsite Construction and Utility Workers from B(a)P, cobalt, zinc, B(a)P, and lead and iron; and offsite Female Construction and Utility Workers from B(a)P.
- Unacceptable risks from dermal contact or incidental ingestion of groundwater are possible for offsite Construction and Utility Workers.
- Unacceptable risks from dermal contact or ingestion of groundwater as potable drinking water are possible for offsite Surface Receptors.
- Unacceptable risks from inhalation of volatiles from soil or groundwater to indoor air are possible for offsite Surface Receptors in residential or industrial/commercial buildings. The following bullets provide additional interpretation:
  - Residential receptors are not present directly to the south or east, closest to where the highest concentrations of volatile COCs in soil have been detected.
  - Per the updated draft MECP document entitled *Technical Guidance for Soil Vapour Intrusion Assessment* (MECP 2021) "soil vapour migration tends to be insignificant at distances of approximately 30 m from the edge of the subsurface contamination" for recalcitrant chemicals, and approximately 10 m for readily-biodegradable chemicals such as PHCs and BTEX. ~~These detected concentrations are approximately 20 m from the property boundary~~.
  - Considering the distances cited by the MECP (2021) and using the generic S-IA components for an offsite ICC land use, the Site soil data was further evaluated for potential issues to offsite commercial buildings (no residences are located within 30 m of a location with a volatiles exceedance). Per Table 3-34a, onsite risks to occupants of commercial buildings were predicted to be greater than MECP target risk values only for benzene, naphthalene, TCE, and PHC F2 in soil. Therefore, these COCs were examined further, as follows:
    - All concentrations of benzene in soil onsite are less than the Table 2 ICC S-IA component value. Risk from lateral gas movement offsite of benzene from onsite soil sources is unlikely.
    - One soil location has concentrations of naphthalene greater than the Table 2 ICC S-IA component (OW07-34D), located approximately 26 m from the southern property boundary. Risk from lateral gas movement offsite of naphthalene from onsite soil sources is unlikely to low based on a single exceedance of the S-IA component and distance of this location to the property boundary.
    - Twelve locations have TCE concentrations in soil greater than the generic Table 6 SCS[5], all locations are within the northeast corner of the Site within 16 m of the property boundary, co-located with highest TCE impacts in groundwater. Risk from lateral gas movement offsite of TCE from onsite soil sources is possible, based on the proximity to the property boundary.

[5] The Table 2 ICC S-IA component is less than background; therefore, the generic Table 6 SCS was used.

However, considering the associated groundwater concentrations in this area, the primary source of potential TCE vapours in this corner are associated with groundwater. RMMs are proposed to mitigate risks to receptors in offsite buildings from offsite groundwater migration.

- One soil location has concentrations of PHC F2 greater than the Table 2 S-IA component (BH07-40), located approximately 25 m from the eastern property boundary. Risk from lateral gas movement offsite of PHC F2 from onsite soil sources is unlikely to low based on a single exceedance of the S-IA component and the distance of this location to the property boundary.

– Based on this evaluation, the potential for risk from lateral soil gas movement offsite of benzene, naphthalene, and PHC F2 from onsite soil sources is considered unlikely to low.

– Soil gas concentrations typically decrease rapidly with distance from the source due to various processes (such as degradation and adsorption); therefore, soil gas generated from impacted soil onsite is less likely to pose a risk to offsite receptors than soil gas generated from impacted groundwater that has migrated offsite (as the "source" would be moving closer to the receptor).

– Considering the existing and future Site conditions and current lack of identified preferential pathways in the vadose zone, the primary migration mechanism for soil gas would be expected to be diffusion and as a result the potential for risks to offsite receptors via the lateral migration of soil gas from soil sources is considered low. Utility corridors can provide a preferential path for contaminated groundwater or volatile transport. Based on the depth of groundwater, the typical depth of underground utilities (1.5 mbgs or deeper), and the presence of permeable materials onsite to the shallow onsite bedrock, COCs are most likely to be transported (that is, to migrate) via groundwater. RMMs are proposed to mitigate risks to receptors in offsite buildings from offsite groundwater migration.

- No unacceptable risks from inhalation of volatiles in outdoor air are expected for offsite Surface Receptors but unacceptable risks are possible for offsite Construction and Utility Workers working in trenches if impacted groundwater migrates offsite.

4.4.3.3 Qualitative Assessment of Direct Contact Exposure – Vapour Skin Contact

Dermal exposure to vapours can be an important pathway in HHRAs—particularly for occupational settings where receptors are wearing a respirator because most of the body burden would likely be derived from dermal exposure. However, with few exceptions, dermal exposure to vapours is generally not considered in HHRAs, as supported by the following documents:

- EPA, 1989 — *Risk Assessment Guidance for Superfund* (RAGS): "Dermal absorption of vapour phase chemicals is considered to be lower than inhalation intakes in many instances and generally is not considered in Superfund exposure assessments."
- EPA, 1992 — *Dermal Exposure Assessment: Principles and Applications*: "Current studies suggest that dermal exposure may be expected to contribute no more than 10% to the total body burden of those compounds present in the vapour phase."
- McDougal and Boeniger, 2002 — "Methods for assessing risks of dermal exposures in the workplace": "In most cases, vapour absorption through the skin would not be of concern unless a respirator is worn because the majority of the body burden would come from inhalation."
- EPA, 2007 — *Dermal Exposure Assessment: A Summary of EPA Approaches*: "Dermal exposures to chemicals present in air are considered unlikely, in most cases, to provide more than 10% of aggregate exposure."

Numerous regulatory documents and scientific journals provide methodologies and equations that can be used to estimate the dermal absorption of chemical vapours (for example, EPA, 1992; McDougal and Boeniger, 2002). At least four different methods can be used to predict an internal dose once an external dose has been estimated. The methods differ in the type and quantity of information required for the calculations, in the simplifying assumptions that are made, and in the reliability of the results. Internal dose can be predicted from external dose based on the following:

- The empirical measurement of fraction of applied dose absorbed
- Measured (or estimated by correlations) steady-state flux or permeability
- Steady-state flux or permeability adjusted by the square root of time
- Biologically based mathematical models (McDougal and Boeniger, 2002)

The equations available for quantifying dermal absorption of chemical vapours are typically simplistic (and often inaccurate), as they do not account for many exposure factors, including the following:

- Individual variability of skin penetrability due to age of the individual and skin condition (for example, broken or damaged skin)
- Variances in the penetrability of the skin in different areas of the body
- Individual variability in the amount of skin available for exposure (that is, clothing or gloves worn)
- Temperature and humidity (both have been shown to affect dermal absorption of chemical vapours)
- Evaporation from skin following deposition onto skin

Estimates of internal dose often rely on information gained from animal studies. However, rodents (frequently used as a model for human exposure and risk) have a different, more permeable skin structure than humans; and, in most cases, there is more penetration data for rodents than for humans. This usually necessitates the use of physiologically based pharmacokinetic modelling, which can further increase the uncertainty of internal dose estimates. Therefore, while dermal exposure to vapours is a potentially complete pathway at the RA Property, Jacobs did not quantitatively evaluate this pathway, given the uncertainty associated with its quantification and the general belief that it does not contribute greatly to a receptor's overall exposure and body burden unless the receptor is wearing a respirator (which is not anticipated at the RA Property).

4.4.3.4 Qualitative Assessment of Contaminants of Concern with Concentrations Less than MECP Component Values

As outlined in Section 4.1.2, a secondary screening against MECP-derived human health component values (MECP, 2011b) was completed for the COCs to determine which would be evaluated quantitatively or qualitatively in the HHRA. Tables 4-1 and 4-2 present the results of this screening for soil and groundwater, respectively. Qualitatively assessed COCs include those with maximum concentrations greater than the Table 6 SCS, but estimated maximum concentrations less than the MECP-derived human health component values (direct contact pathways), or maximum theoretical indoor air concentrations less than HBIAC values and maximum concentrations less than the human health component values (for inhalation pathways). For these COCs, risks to receptors (including Pregnant Females) are considered to be less than the MECP target cancer and noncancer risk levels. Therefore, the proposed human health PSSs are based on the estimated maximum concentration of each COC.

4.4.3.5 Qualitative Assessment of Parameters without Toxicity Data

Lead

Lead was retained as a COC in soil and groundwater for quantitative evaluation in the HHRA, since the estimated maximum concentrations in both media were greater than the Table 6 SCS. Recent science suggests any exposure to lead may result in an adverse effect, especially to infants and children. The current Canada BLL "intervention level" is 10 µg/dL; however, there is evidence to suggest adverse impacts at lesser BLLs (as low as 1 to 2 µg/dL) (Health Canada, 2013). Therefore, there are uncertainties associated with TRVs that have not considered the potential adverse health effects associated with lower BLLs, including those used to derive the generic MECP standards.

The Rationale Document (MECP, 2011b) acknowledges that lead was an exception in the development of the generic standards and human health component values:

> *"For some substances, a threshold for non-cancer effects may not exist, or may not be possible to discern. In such instances, establishing a guideline or standard cannot be based on target HQ. Instead, the guideline or standard may be based on a policy decision regarding an acceptable level of adverse effect or uncertainty. Lead is an example of such a substance."*

In response to the changing science, various regulatory agencies, including EPA and Health Canada, are in the process of reassessing their previously published policies, TRVs, and soil and groundwater quality guidelines for lead. As a result, Jacobs did not quantify exposure and risk from oral and dermal contact with lead in soil or groundwater within the HHRA.

A qualitative evaluation of oral, dermal, and inhalation (dust) exposures to lead has been conducted using the MECP *Table 1 Full Depth Background Site Condition Standards* (Table 1 Standard) (MECP 2011c), which represent background conditions in Ontario. The background soil and groundwater values are considered appropriate to determine whether lead concentrations measured at the RA Property may pose a risk to human health greater than that expected at an Ontario property that has not been impacted by anthropogenic activities. The estimated maximum concentration of lead in soil at the RA Property is 12,000 µg/g, which is 100 times greater than the MECP Table 1 Standard for lead of 120 µg/g. Seventy-six soil samples (approximately 33 percent of soil samples analyzed for metals) had concentrations of lead exceeding 120 µg/g. Therefore, this elevated lead concentration in soil may pose a risk to onsite receptors at the RA Property and offsite Surface Receptors and Workers.

The estimated maximum concentration of lead in groundwater at the RA Property is 17 µg/L, which is 9 times greater than the MECP Table 1 Standard for lead of 1.9 µg/L. Four groundwater samples (approximately 2 percent of groundwater samples analyzed for metals) had concentrations of lead exceeding 1.9 µg/L. Therefore, this elevated lead concentration in groundwater may pose a risk to onsite receptors at the RA Property and offsite Surface Receptors and Workers.

To mitigate the potential risks from direct contact with lead in soil and groundwater, and inhalation of lead in soil, RMMs to prevent or reduce contact with lead-impacted soils and groundwater are recommended as part of the RMP (Section 7). As RMMs will be implemented, the proposed human health PSSs for lead are based on the estimated maximum concentration of lead currently remaining onsite.

Bismuth

A literature search was performed to identify one of more of: Ontario or Canadian background concentrations for bismuth, human health soil screening values, or agency-approved TRVs for bismuth. As a result of this search, only one human health specific soil screening value was identified. The Texas Commission on Environmental Quality (TCEQ), as part of their Texas Risk Reduction Program, has derived a Protective Concentration Level (PCL) (TCEQ 2021) for bismuth for residential receptors. The PCLs consider direct contact (ingestion and dermal) with soil and ingestion of vegetables grown in impacted soil. The PCL derived by TCEQ for bismuth is 37,000 µg/g for residents based on the direct contact pathways only. The value is based on non-carcinogenic risk using an RfD (oral) of 5.0E+01 mg/kg/day. The source of the TRV is listed as being derived directly by TCEQ; the supporting documentation for the derivation of this TRV was not readily available online. Due to the lack of information available for bismuth and the known low toxicity to humans via the intake of medicinal products (Wang et al.), the TCEQ value was determined to be adequate for use in the qualitative assessment. The TCEQ PCLs are based on a HQ of 1.0 (TCEQ 2008); therefore, the PCL was divided by 5 to adjust to a target HQ of 0.2 for use in this RA. Therefore, the adjusted soil screening level used for the qualitative assessment of bismuth is 7,400 µg/g.

The estimated maximum concentration of bismuth in soil at the RA Property is 180 µg/g, which is approximately 40 times lower than the adjusted soil screening value of 7,400 µg/g. Of the 103 soil samples analyzed for bismuth (12 samples as part of historical investigations and 91 samples as part of recent investigations), only 12 samples had detected concentrations, ranging from 1.7 µg/g to 150 µg/g. Therefore, the bismuth concentrations in soil are unlikely to pose a risk to onsite receptors at the RA Property and offsite Surface Receptors and Workers from oral, dermal, and inhalation (dust) exposures.

As RMMs will be implemented across the property for other COCs and no adverse impacts from bismuth are anticipated, the proposed human health PSS for bismuth is based on the estimated maximum concentration of bismuth currently remaining onsite.

Iron (Dust Only)

A qualitative evaluation of inhalation (dust) exposures to iron has been conducted using the MECP *Ontario Typical Range* (OTR) values (MECP 2011c), which represent background conditions in Ontario. The background soil values are considered appropriate to determine whether iron concentrations measured at the RA Property may pose a risk to human health greater than that expected at an Ontario property that has not been impacted by anthropogenic activities. The estimated maximum concentration of iron in soil at the RA Property is 150,000 µg/g, which approximately 4 times greater than the OTR for iron of 38,000 µg/g. Twenty-five of 135 soil samples (approximately 19 percent of soil samples analyzed for iron) had concentrations of iron exceeding 38,000 µg/g. Therefore, elevated iron concentrations in soil may pose a risk to onsite receptors at the RA Property and offsite Surface Receptors and Workers via the inhalation of dust.

To mitigate the potential risks from inhalation of iron in soil, RMMs to prevent or reduce dust generation are recommended as part of the RMP (Section 7). As RMMs will be implemented, the proposed human health PSS for iron is based on the estimated maximum concentration of iron currently remaining onsite.

Ecological Contaminants of Concern

One parameter that was not applicable to human health was retained as soil a COC via the screening process outlined in Section 3: EC. This parameter is included in the ERA presented in Section 5 of this RA. As human health toxicity data have not been developed for this parameter, Jacobs based the proposed human health PSS on the estimated maximum concentration.

Essential Nutrients

Essential nutrients are needed to maintain basic life functions. Because these chemicals are essential nutrients and they have relatively low toxicity to human health, TRVs may not have been developed for them. The physiologically essential levels for these nutrients are recommended for daily intakes from various health agencies worldwide. Values adopted by Health Canada (2010b) were used in the current assessment. Values used to determine the intake of essential nutrients at the Site include:

- Tolerable Upper Intake Level (UL) – The UL is the highest average daily nutrient intake level likely to pose no risk of adverse health effects to almost all individuals in a given life-stage and gender group.

- Adequate Intake (AI) – The AI is the average recommended daily allowance (RDA) of a nutrient based on observed or experimentally determined approximations or estimates of nutrient intake by a group (or groups) of apparently healthy people who are assumed to be maintaining an adequate nutritional state.

Using the UL and AI values described, the intake of essential nutrients detected at the RA Property (specifically, calcium and magnesium in soil) were calculated (Table 4-39) for a Toddler based on the soil ingestion rates used in the RA to determine if the intake from Site soil represents a significant proportion of the UL or AI values. The following subsections describe the results.

Calcium

Calcium occurs abundantly in nature as least soluble calcium compounds. Several foods are rich in calcium such as milk, cheese, green leafy vegetables, soybean products, fortified flour, and various nuts. The concentration of calcium in natural drinking water varies from less than 100 mg/L in soft water to 300 mg/L in hard water areas. Calcium intake is required for healthy bone formation, and the reference nutritional intake of calcium is 350 mg/day to 1,000 mg/day. Calcium is beneficial to health in reducing cell proliferation that is a precursor to certain forms of cancers and in reducing hypertension among adults. It is essential for skeletal structure and also is a cofactor in various enzyme metabolisms. TRVs were not developed for calcium as it is a nutritionally essential element and has relatively low toxicity (NIH 2021a)

- Calcium in Soil: The UL for calcium is 2,500 mg/day, and RDA/AI is 750 mg/day (based on a child 1-3 years old). Assuming a soil ingestion rate of 200 mg/day (based on the toddler soil ingestion exposure), with the estimated maximum concentration of calcium in soil of 260,000 mg/kg, receptor intake is estimated to be 52 mg/day, which is less than both the UL and the RDA/AI values. The proportion of the UL and RDA/AI, are approximately 2% and 7%, respectively. Therefore, detected concentrations of calcium in RA Property soil are unlikely to result in an adverse effect to human receptors at the Site.

Magnesium

Magnesium is the eighth most abundant element in the earth's crust and is ubiquitous in foods such as: leafy vegetables, grains, nuts, meats, and dairy. Magnesium is also used in antacids and as a food additive or supplement. It is essential for normal cell functioning as a cofactor for many enzyme systems and is required for "protein synthesis, muscle and nerve function, blood glucose control, and blood pressure regulation". Magnesium regulates the movement "of potassium and calcium ion across cell membranes". Magnesium is an important element in the metabolism and action of vitamin D and is essential for the synthesis and secretion of parathyroid hormone (NIH 2021b). Thus, TRVs have not been developed for magnesium.

- Magnesium in Soil: The UL for magnesium is 65 mg/day, and RDA/AI is 80 mg/day (based on a child 1-3 years old). The UL for magnesium does not account for food of water intake; therefore, the value appears to be biased low as it is less than the RDA/AI. Assuming a soil ingestion rate of 200 mg/day (based on toddler soil ingestion exposure), with the estimated maximum concentration of magnesium in soil of 140,000 mg/kg, receptor intake is estimated to be 28 mg/day, which is less than the UL and RDA/AI values. The proportion of the UL and RDA/AI, are approximately 35% and 43%, respectively. These proportions are higher than the analogous 20% of the TRV (HQ) used for evaluating noncancer risks. However, as magnesium is not volatile, daily exposures may be sourced from soil, water, food, and consumer products; therefore, assuming that a slightly higher proportion from soil would not result in an adverse effect may be appropriate. In addition, U.S. dietary surveys indicate that approximately 48% of people consume less than the RDA/AI of magnesium from food and beverages, with adolescents of both ages "most likely to have low intakes" (NIH 2021b). Considering this information, the detected concentrations of magnesium in RA Property soil are unlikely to result in an adverse effect to human receptors at the Site.

4.4.3.6 Qualitative Assessment of NAPL

The presence of NAPL has been confirmed at the RA Property in a limited area. Three monitoring wells (all screened within the overburden and bedrock contact zone aquifer unit) in the eastern portion of the Site have measured NAPL floating on the water table located right at or below the overburden and bedrock contact (refer to Figures 6-15, 6-15a, and 6-15b in Appendix D3). Therefore, additional consideration of potential risks related to NAPL, and the potential need for additional RMMs due to the presence of NAPL, is warranted. The MECP SCS and component values considered in the evaluation of COCs for the RA Property, and the equations applied in the calculations of risk and hazard, are based on the assumption that the petroleum hydrocarbons are distributed between the dissolved, vapour, and sorbed phases (that is, three phases are considered). With the limited area of NAPL present at the RA Property, nonaqueous-phase hydrocarbon could be present in addition to the dissolved, vapour, and sorbed phases (that is, four phases are present).

The presence of NAPL could have implications for the risk evaluations that rely on the application of partitioning equations (that is, movement to indoor air and outdoor air). Direct contact exposure to NAPL itself would also be possible in areas where NAPL is present. The quantitative assessment of risks due to impacts in soil and groundwater (Section 4.4.2) has already indicated unacceptable risks are present along the following pathways for PHCs:

- Human direct contact with soil (dermal and ingestion)
- Human direct contact with groundwater (dermal and ingestion)
- Inhalation of indoor air

The exposure pathways for which the estimated exposure and risk could be affected by the presence of NAPL include direct contact with soil and groundwater (dermal and ingestion) and inhalation (indoor and outdoor). The inhalation of dust pathway is believed to be insignificant in the context of NAPL, as saturated soils would not become airborne. Each of these pathways is discussed below:

- Direct contact with Soil - As the MECP direct contact component values do not rely on partitioning equations (which may be invalidated by the presence of NAPL), the exposure and risk estimates previously presented (Section 4.4.2.1 and 4.4.2.4) for PHCs for this pathway are considered an estimate of the minimum risks that may occur in the presence of NAPL. RMMs (Section 7) were recommended for this pathway to reduce the risks to acceptable levels; the proposed RMMs will also be protective if NAPL is present.

- Direct contact with Groundwater – As the MECP direct contact component values do not rely on partitioning equations (which may be invalidated by the presence of NAPL), the exposure and risk estimates previously presented for Workers in contact with groundwater(Section 4.4.2.2 and 4.4.2.5) for PHCs for this pathway are considered an estimate of the minimum risks that may occur in the presence of NAPL. RMMs (Section 7) were recommended for this pathway to reduce the risks to acceptable levels; the proposed RMMs will also be protective if NAPL is present.
- Inhalation of Indoor Air – Risks to receptors in existing and future buildings were predicted from PHCs from both soil and groundwater sources. The exposure and risk estimates previously presented (Section 4.4.2.11) for PHCs for this pathway are considered an estimate of the minimum risks that may occur in the presence of NAPL. RMMs (Section 7) were recommended for this pathway to reduce the risks to acceptable levels; the proposed RMMs will also be protective where localized NAPL is present.
- Inhalation of Outdoor Air –The highest estimated outdoor air risk from PHC F2 was an HQ of 0.1 (for the Construction and Outdoor Worker, at the ground surface). This HQ is five times less than HQ for PHCs of 0.5. Considering the conservative assumptions that were assumed for the outdoor air modelling (for example, Jacobs selected the lowest average windspeed at the surface, ignored degradation and infiltration, and assumed receptors are exposed to the maximum soil or groundwater contraction for all exposures) and the limited extent of NAPL onsite, risks from outdoor air with respect to NAPL is considered low. Therefore, no RMMs are recommended for the outdoor air pathway for receptors at the surface even where NAPL is present. For Workers in a trench, the highest estimated outdoor air risk from PHC F2 for the Construction Worker was an HQ of 3.0, which greater than the acceptable HQ of 0.5 for PHCs. Therefore, it is possible that risks could be even greater for Workers in a trench in the presence of NAPL. RMMs (Section 7) were recommended for this pathway to reduce the risks to acceptable levels; the proposed RMMs will also be protective if NAPL is present.

In summary, the RMMs proposed in Section 7 for the protection of the direct contact with soil, groundwater, and vapour intrusion pathways are also adequate to protect receptors where NAPL is managed in place. Based on the qualitative evaluation of the localized presence of NAPL, additional RMMs are proposed to protect subsurface workers in contact with groundwater and working within trenches (outdoor air inhalation).

4.4.3.7 Qualitative Assessment of Ingestion Exposure - Home Garden Produce

As discussed in Section 4.2.2.1, there are significant uncertainties associated with quantifying exposure to home garden produce. As concentrations of COCs are present at levels greater than the Ontario background concentrations (that is, the Table 1 Standard [MECP, 2011c]), there is assumed risk from ingestion of produce grown on the RA Property. Therefore, RMMs will be proposed that prohibit the planting of fruit or vegetable gardens at the RA Property except in containerized plots or aboveground containers.

4.4.3.8 Qualitative Assessment of Inhalation of Soil Particulates that are Ingested

MassDEP (2008) provides guidance on assessing the ingested portion of soil (dust) particulates (greater than PM_{10} and less than PM_{30}). The fraction of inhaled particulate matter that is ultimately swallowed is assumed to be 1.4, which represents the fraction of all particles in air greater than PM_{10} and less than PM_{30} that are ingested (assumed to be 100% or a fraction of 1) plus the fraction of PM_{10} that is not deposited into the lungs (100% minus 60% [using the MECP assumption of 0.6] = 40% or a fraction of 0.4). Considering a sensitive receptor (pregnant female construction worker) and using other MECP defaults for the particulate concentration in air, body weight, inhalation rate, and exposure duration combined with an assumed contaminant concentration in soil of 1 µg/g, the particulate ingestion dose is approximately

3.E-09 mg/kg/day. Incidental ingestion exposure based on Site-specific COC concentrations in soil for this receptor are several orders-of-magnitude higher, ranging from 3.E-06 to 1.E-01 mg/kg/day. Adding the estimated exposure for the two ingestion pathways results in an insignificant change to the overall ingestion exposure. These results indicate that the particulate (dust) ingestion pathway does not contribute significantly to the overall risk for ingestion when default MECP assumptions are applied. This conclusion may differ under certain scenarios where PM_{10} concentrations could be generated at levels greater than the typical MECP default. For the current RA, the risk estimates based on the conventional incidental soil ingestion pathway are sufficient to base risk management decisions on. Since the contribution of soil ingestion to the overall exposure is considered negligible for this sensitive receptor/COC combination, it is assumed to be negligible for all other less sensitive receptor/COC combinations.

4.4.3.9 Qualitative Assessment of Soil Odour Pathway

The Rationale Document (MECP, 2011b) contains aesthetic criteria for soil odour (S-Nose component) which contemplates a receptor smelling soil while gardening. A qualitative assessment was completed to determine the potential for aesthetic effects associated with onsite soils. The following COC had an estimated maximum concentration in soil greater than the S-Nose component[6]:

- Methylnaphthalene 1,2- (9 samples with concentrations greater than the S-Nose component)

Based on this comparison to the S-Nose values, the potential for elevated soil odour cannot be ruled out; however, it is noted again that the S-Nose values were evolved to be protective of a scenario where a receptor may smell a handful of soil at close range while gardening. Given that RMMs (specifically, capping and administrative controls) have been determined to be required to prevent direct contact with existing Site soils based on the quantitative evaluation, and gardening of home produce has been prohibited in Site soils, the potential for soil odour to cause an adverse effect at the Site is limited. With the implementation of these RMMs, Site soils with concentrations exceeding the S-Nose component values are expected to be located beneath a cap. Additionally, to address the potential for odour issues in soil used for fill caps, an olfactory screening step has been included in the soil management process for the construction of fill caps (Sections 7.2.2 and 7.2.3.2).

4.4.3.10 Qualitative Assessment of Potable Groundwater Odour Pathway

The Rationale Document (MECP, 2011b) contains aesthetic criteria for potable groundwater odour (GW1-Odour component). A qualitative assessment was completed to determine the potential for aesthetic effects associated with the use of onsite groundwater as a potable water source. The following COCs have an estimated maximum concentration in groundwater greater than the GW1-Odour component (Appendix F, Table F1-6):

- Methylnaphthalene 1,2-
- Naphthalene
- Trichloroethylene

Based on this comparison to the GW1-Odour values, the potential for groundwater odour cannot be ruled out if groundwater at the Site is used as a potable resource. Given that RMMs (specifically, a restriction on the installation of potable and commercial wells) have been determined to be required to prevent potable water use of the existing Site groundwater based on the quantitative evaluation, the potential for groundwater odour to cause an adverse aesthetic effect at the Site is limited. As the groundwater odour

[6] In the absence of a soil component table for Table 6 (MECP, 2011b), the S-Nose components from the table entitled *Soil Components for Table 2 – Full Depth, Potable Water Scenario* (Coarse Textured Soil, Residential/Parkland Land Use) was used.

pathway is considered minor in comparison to the health-based direct contact pathway (quantitatively assessed in Section 4.4.2), no specific RMMs have been proposed to address the potential for groundwater odour. Section 7.2.3.6 describes the proposed potable and commercial well restriction RMM for the Site based on the results of the quantitative assessment.

4.4.3.11 Qualitative Assessment of Soil Leaching to Potable Groundwater

The MECP (2011b) has published soil values that are protective of human receptors from COCs in soil leaching to groundwater with subsequent use as potable water (S-GW1). Table F1-7 in Appendix F1 presents the S-GW1 component values (Table 2 values were used in the absence of Table 6-specific values); note, the MECP did not develop S-GW1 values for metals and inorganics (except for mercury), as these analytes are not considered mobile or are not significantly mobile under normal soil conditions (for example, if soil pH is within the acceptable range).

Based on the comparison to the S-GW1, 14 soil COCs were identified with estimated maximum concentrations in soil greater than the S-GW1 component value within the RA Property:

- Acenaphthene
- Benzo(a)anthracene
- Benzo(a)pyrene
- Benzo(b)fluoranthene
- Benzo(k)fluoranthene
- Chrysene
- Dibenzo(a,h)anthracene
- Ethylbenzene
- Fluoranthene
- Naphthalene
- PHC F3
- Phenanthrene
- Pyrene
- Trichloroethylene

The S-GW1 values are calculated using GW1 values, combined with partitioning and transport models. As an intermediate step in the MECP's calculation of the S-GW1 soil values, concentrations of COCs in groundwater that have leached from soil are estimated. However, site-specific groundwater data are available to directly consider groundwater concentrations, as data from 94 monitoring well locations across the RA Property are included in the RA dataset (refer to Appendix D2). These measured groundwater concentrations provide a more direct and site-specific reflection of actual groundwater conditions, including potential leaching from soil. Of the 14 COCs with soil concentrations greater than the site-specific S-GW1, all but one parameter (dibenzo[a,h]anthracene) were retained for further assessment in groundwater based on their maximum observed groundwater concentrations exceeding the generic Table 6 SCS (refer to Table F1-2 in Appendix F1). The maximum measured concentration of dibenzo[a,h]anthracene in groundwater was half the Table 6 SCS value based on 189 samples from 55 monitoring wells; therefore, this analyte was not retained as a groundwater COC. Leaching of this analyte from soil does not appear to be of concern at the Site.

Contamination at the RA Property resulted from historical sources. The RA considers groundwater data from 2007 to 2020; therefore, the past and present potential for contaminant leaching to groundwater is reflected by the currently measured groundwater concentrations. Based on this information, potential risks to human receptors from RA Property potable groundwater use were evaluated primarily by comparing measured groundwater concentrations to the GW1 values. Table F1-4 in Appendix F1 presents the GW1 component values. As the quantitative assessment of the direct contact with potable groundwater pathway considers all the soil COCs[7] which had concentrations greater than the S-GW1, the risk to human health has been appropriately assessed. No specific RMMs have been proposed for this

[7] Apart from dibenzo(a,h)anthracene, which is not a COC in groundwater.

pathway. Section 7.2.3.6 describes the proposed potable and commercial well restriction RMM for the Site based on the results of the quantitative assessment.

4.4.4 Human Health Standards Based on Quantitative and Qualitative Interpretation of Health Risks

The quantitative and qualitative assessment of exposure pathways indicate health risks are possible to current and future receptors for the exposure scenarios discussed. The rationales for the development of the PSSs that are protective of human health are discussed in this section. Risk management is proposed where the assessment indicated a potential risk at the PSS.

4.4.4.1 Development of Property-specific Standards

Jacobs selected the estimated maximum concentration, defined as the maximum plus 20 percent (of detected values) or the maximum reported detection limit (RDL), for each COC to be representative of a reasonable upper-estimate of actual soil and groundwater concentrations remaining on the RA Property. COCs were selected based on the Table 6 SCS and the shallow bedrock conditions have been considered in setting the PSS for the Site. Proposed PSSs for soil and groundwater applicable to human health were selected as described in the following subsections.

4.4.4.2 Soil

PSSs for COCs identified in soil were based on the following:

- The estimated maximum if no unacceptable risks were predicted in the quantitative or qualitative assessment
- The estimated maximum if unacceptable risks were predicted in the quantitative or qualitative assessments, and exposure pathways with risk exceeding target levels are eliminated using RMMs

Table 4-~~39~~ 40 presents the PSS values selected for soil to be protective of human health.

4.4.4.3 Groundwater

PSSs for COCs identified in groundwater were based on the following:

- The estimated maximum if no unacceptable risks were predicted in the quantitative or qualitative assessment
- The estimated maximum if unacceptable risks were predicted in the quantitative or qualitative assessment, and exposure pathways with risk exceeding target levels are eliminated using RMMs

Table 4-~~39~~ 40 presents the PSS values selected for groundwater to be protective of human health.

4.4.5 Special Considerations

The special conditions for environmentally sensitive areas, shallow soil properties, and water bodies cited under Sections 41 and 43.1 of O. Reg. 153/04 apply to the RA Property. Specifically, due to shallow bedrock conditions on a portion of the property, the RA Property is considered a shallow soil property under Section 43.1. This condition was considered in the initial screening of chemicals by using the Table 6 SCS to determine the COCs to be assessed for the RA Property (Section 3.3). As such, the proposed PSSs for human health have accounted for the conditions cited under Section 43.1 of O. Reg. 153/04. Section 41 (for environmentally sensitive areas) and Section 43.1 (specifically with respect to water bodies) do not apply to the RA Property.

4.4.6 Interpretation of Off-Site Health Risks

The proposed PSSs for soil COCs (presented in Table 4-~~39~~40) are not anticipated to result in a concentration exceeding the applicable generic MECP standard (inferred to be the Table 6 SCS) at the nearest offsite property. Soil has the potential to migrate offsite via dust originating from soils at the RA Property; however, this mechanism is unlikely to result in a material change to offsite soil concentrations. In addition, elevated risks from dust inhalation were identified only for the Pregnant Female Workers (Construction or Utility) for B(a)P and for the Construction Worker for B(a)P, cobalt, and zinc during construction activities. Elevated risks from lead and iron in dust were identified for all receptors, based on the qualitative assessment. The RMMs required during construction activities to reduce the potential risk to acceptable levels onsite would prohibit transmission of PAH- and metals-containing dust offsite.

The proposed PSSs for groundwater COCs (presented in Table 4-~~39~~40) could result in concentrations exceeding the applicable generic MECP standards (Table 6 SCS) at the nearest downgradient offsite property if groundwater containing COCs at PSS concentrations greater than the applicable SCS migrates offsite. Table 4-~~40~~ 41 lists the groundwater COCs for the RA Property and assesses whether the proposed PSSs are likely to result in an offsite exceedance of the Table 6 SCS (inferred to apply to the nearest downgradient offsite properties), and whether the parameter is mobile[8]. If the potential for an offsite exceedance could not be ruled out, the nearest offsite human receptor was identified.

Groundwater flow direction was considered in this assessment. As discussed in Section 3.2, the predominant groundwater flow direction in the Overburden and Bedrock Contact Zone is from the northeast to the southwest, with ~~generally flows~~localized flow from west to east on western portion of the Site and localized flow~~s~~ from east to west on the eastern portion of the Site. Groundwater in the Eramosa Formation (Potentiometric surface), appears to flow predominantly to the ~~south~~east.

As indicated in Table 4-~~40~~41, the potential for an offsite exceedance of the applicable generic MECP standard for several parameters cannot be ruled out. As these parameters have a PSS greater than the Table 6 SCS and can potentially be mobile in groundwater, they have the potential to pose a risk to a downgradient offsite property. Groundwater monitoring is proposed on Site for these parameters (Section 7).

Offsite groundwater quality can be addressed onsite by monitoring groundwater movement, allowing natural attenuation, and notifying appropriate stakeholders in the event of offsite migration.

4.4.7 Discussion of Uncertainty

By its very nature, RA is an uncertain endeavour. Assumptions must be made regarding receptors that are potentially exposed. Often, exposure point concentrations must be estimated via modelling or other estimation methods. Without exception, toxicity indices are developed by credible government agencies and are purposefully calculated in a conservative fashion to monitor that benchmarks for estimating toxicity effects have a sufficient margin of safety to protect human health.

[8] The potential for contaminant of concern (COC) mobility in groundwater was assessed using professional judgement considering the Site history, distribution of COCs in soil and groundwater, as well as the individual COC's physical and chemical properties. Guidance from the New Jersey Department of Environmental Protection (NJDEP, 2008) related to the mobility of chemicals based on the organic carbon partition coefficient was also considered. In general, volatile organic compounds (VOCs), "light" polycyclic aromatic hydrocarbons (PAHs), and "light" petroleum hydrocarbons (PHCs) were considered potentially mobile, while "heavy" PAHs and "heavy" PHCs are unlikely to be mobile.

4.4.7.1 Hazard Analyses and Problem Formulation

Hazard analyses and problem formulation are conservative in nature and are developed so potential elevated risks are identified at the RA Property. This section qualitatively evaluates the extent to which chemicals at the RA Property may cause adverse health effects on receptors of concern.

COCs have been detected in soil and groundwater at the RA Property, indicating a potential risk exists. The screening process is conservative and could lead to the identification of COCs (and their inclusion in the RA) that do not actually indicate a potential risk at the RA Property. The inclusion of these COCs in the RA has little effect on the conclusions of the evaluation.

4.4.7.2 Exposure Assessment

Uncertainty exists in the exposure assessment of the RA. Onsite receptors were hypothesized, and activities assumed to result in exposures, as follows:

- EDs and EFs were assumed to occur on a regular and long-term basis, despite the reasonable potential that receptors may relocate residences; therefore, may change recreational places, may change employment or job descriptions, and are unlikely to contact chemicals on a routine basis. The conservative way receptors have been identified and activities evaluated indicates that uncertainties in the exposure assessment most likely allow for an overestimation of risk.
- The exposure assessment section also defines the concentrations to which potential receptors may be exposed. Within the RA Property boundaries, vapour concentrations have been estimated using conservative models that incorporate general fate and transport factors intended to conservatively overestimate vapour concentrations to which exposures might occur. This approach results in an overestimate of exposure and associated risk to certain receptors. These conservative assumptions likely overestimate exposures to the COCs and, correspondingly, overestimate risk. These assumptions impart uncertainty to the RA but are developed to confirm the RA conclusions are conservative and protective of human health. The net effect of these uncertainties is that risk to potential receptors has likely been overestimated.
- Estimated maximum concentrations of chemicals in soil and groundwater were used in the modelling. Concentrations of contaminants are not uniformly distributed across the RA Property. These concentrations appear in localized areas on the RA Property and represent the greatest concentration based on judgmental sampling. Receptors would not consistently be exposed to the maximum concentrations present at the Site over their lifetime; therefore, the predicted risks have likely been overestimated.
- The selected incidental ingestion rates for soil and groundwater may be different from the experimental basis used to develop them (for example, Construction and Utility Worker incidental ingestion of groundwater is based on exposure while swimming and not incidental contact while working). Changes in ingestion rate would increase or decrease the predicted exposures and risk.
- The conditions at a site may not match the conditions during the study upon which the dermal adherence factor is based. For example, studies have found finer particles adhere preferentially to the hands unless soils are greater than 10 percent moisture. Some studies have found soil particles greater than 250 micrometres (µ) do not adhere readily to skin (EPA, 2004). Thus, the soil type, including moisture content, can affect the adherence of soil. In addition, the specific activity that occurs in the site-specific exposure scenario may not directly match the activities on which adherence factors were based. These factors can introduce uncertainties into the exposure assessment.

4.4.7.3 Toxicological Information

There is a limited amount of toxicological information on the effects associated with human exposures to low levels of chemicals in the environment. What human information is available is generally based on epidemiological studies of occupationally exposed workers. These studies are generally limited in scope and provide results that may not apply to chronic or continuous exposures to low levels of chemicals. Because human toxicological information is limited, RfDs and cancer potency estimates for many compounds are based on the results of dose-response assessment studies using animals.

The use of experimental animal data to estimate potential biological effects in humans introduces uncertainties into the evaluation of potential human health effects. These estimations require that several assumptions be made, including:

- The toxicological effect reported in animals is relevant and could occur in humans.
- The extrapolation from high-dose studies to low-dose environmental exposures adequately represents the shape of the dose-response curve in the low-dose exposure range.
- Short-term exposures used in animal studies can be extrapolated to chronic or long-term exposures in humans.
- The uptake of a compound from a test vehicle (including drinking water and food) in animals will be the same as the uptake of the chemical from environmental media (soil, sediment, airborne particulate matter) in humans.
- The pharmacokinetic processes that occur in the test animals also occur in humans.

There are clearly a number of uncertainties associated with extrapolating from experimental animal data to humans. To address these weaknesses, regulatory agencies, such as Health Canada and EPA, incorporate several conservative assumptions to try and account for the uncertainties associated with this process. The uncertainties are accounted for by using UFs that serve to reduce the RfD to far less than the level at which adverse health effects have been reported in the test species. UFs are generally applied by factors of 10 and are used to account for the following types of uncertainties:

- Variation within the population (protection of sensitive members of the population)
- Differences between humans and the test species
- Differences in using short- or medium-term studies to estimate the health effects associated with long-term or chronic exposures
- Limitations in the available toxicological information

The magnitude of the UFs applied by the various regulatory agencies indicates the level of confidence that should be placed in the reference value. UFs typically range between 100 and 10,000, although some can be less than 10. The latter values are found for a few chemicals where sound and substantial human toxicological information is available to enable setting a toxicological end-point solely on the basis of human epidemiological information.

The application of UFs is intended to address technical uncertainties in toxicological data, and to confirm, as much as possible, that limited exposures that exceed the RfC will not result in adverse human health effects. Because RAs that use these regulatory limits incorporate the conservatism used in the development of the toxicological information, the results can generally be viewed as being extremely conservative.

4.4.7.4 Risk Characterization

The risk characterization phase of the RA integrates toxicity and exposure information to determine the potential for adverse health effects. In large part, the uncertainty resulting at this phase of the RA is a direct result of those uncertainties that have been discussed previously. As such, based on the foregoing evaluation, health risk is largely overestimated. However, it is important to note that benchmarks constituting substantial risk are arbitrarily selected and, as such, become value judgments as to their significance. In all instances, the risks deemed to be significant (that is, one in a million cancer risks for exposures from source related chemicals) are small relative to health risks associated with typical activities in a modern society (that is, approximately one in three cancer risks from all societal exposures). This does not diminish the importance of the excess risk noted in this report. The following summarizes uncertainties relating to the assessment at the RA Property (included in Section 4.4.2):

- Concentrations of contaminants are not uniformly distributed across the RA Property. The estimated maximum detected values for chemicals in soil and groundwater were used in the modelling. These concentrations appear in localized areas on the RA Property and represent the greatest concentration based on judgmental sampling. Receptors would not consistently be exposed to the maximum concentration present at a site over their lifetime; therefore, the predicted risks have likely been overestimated.
- The incidental ingestion rates may be different than the experimental basis used to develop them. Changes in ingestion rate would increase or decrease the predicted risk.
- The model does not account for the removal of contaminants (from soil) from the receptors' hands by brushing or washing off. This overestimates the risk from exposure.
- The amount of groundwater assumed to be incidentally ingested by Construction and Utility Workers during construction activities in this assessment is equivalent to the amount considered to be ingested during swimming activities (50 mL, as specified by EPA [1989]). The actual ingestion of groundwater is likely to be insignificant.
- Typical construction activities include dewatering excavations; therefore, it is unlikely that Construction and Utility Workers will be exposed to groundwater. Less exposure will result in lesser risk estimates.
- The comparators used to predict risk (that is, RfC and UR) are values considered to be protective of lifetime exposure to chemicals—24 hours per day, 7 days per week, 52 weeks per year, for 70 years—and include adjustments for sensitive individuals in the human population. Therefore, for a human receptor, risks are overestimated for short-term exposure to chemicals that may be present in air from dust, as no person will occupy the RA Property for any duration consistent with the duration used to develop the comparators. Adjustment of the comparator for shortened duration would likely result in a decreased risk for receptors.
- Risks from dust to offsite receptors would likely be less than experienced by RA Property users, since the concentration of COC-impacted fugitive dusts diminishes with dispersion and dilution in air rapidly with distance (EPA, 2002a).
- Vapour concentrations inside a generic commercial or generic residential building were modelled assuming the structure lies directly over the estimated maximum soil or groundwater concentration detected at the RA Property (only for volatile COCs). This assumption is conservative; therefore, the predicted risks from indoor air inhalation have likely been overestimated.
- While developing indoor air and outdoor air volatile concentrations, the degradation of organic compounds was ignored. If degradation was included, the chemical concentration would decrease, resulting in a decrease the estimated risks.

- Due to uncertainties associated with the available TRVs for lead, which may not consider the potential adverse health effects at BLLs less than the current Canadian BLL intervention level of 10 µg/dL, exposure and risk to lead via the direct contact and inhalation routes have not been quantitatively assessed in the RA. Lead has also been identified as a developmental toxicant but was not assessed quantitatively via the Pregnant Female receptor, as no TRV protective of developmental effects to a foetus is available.
- Due to a lack of appropriate TRVs, risks to bismuth have been qualitatively assessed using an adopted soil screening value. The lack of a quantitative assessment for this COC has little effect on the conclusions of the evaluation. Since an elevated risk has already been determined for onsite receptors from other COCs, the recommendation that RMMs should be implemented at the RA Property is not affected by this uncertainty.

4.4.8 Risk-based Concentrations for Fill Caps

The fundamental approach to preventing contact with contaminated soils is to construct a cap or soil barrier where RMMs are required. The cap or barrier must prevent human exposure to COCs and prevent mobilization of the contaminants. The purpose of the barrier is to prevent direct contact without relying on personal protective equipment (PPE) or clothing. Cap risk-based concentrations are developed for the anticipated future land use scenario as mixed residential and commercial.

Risk-based concentrations (RBCs) for fill caps were developed based on dermal contact and incidental ingestion exposure to soil by the Resident, Construction Worker, Utility Worker, Outdoor Worker, Indoor Worker, and Pregnant Female Worker, for a future mixed residential and commercial land use scenario.

Soil RBCs based on inhalation, dermal, and ingestion exposures were developed by applying a target ILCR of 1×10^{-6}, a target HQ of 0.2 for all COCs except PHC, and a target HQ for PHC fractions and TCE (inhalation pathways only) of 0.5. The soil RBCs apply for soil pH ranges of 5 to 9.

Tables 4-~~41a~~ 42a and 4-~~41b~~ 42b present the soil RBCs relevant to human health based on the direct contact pathway (dermal contact and ingestion) for the residential land use scenario for residents and subsurface workers, respectively. MECP generic soil direct contact component values (that is, S1) were adopted as the direct contact RBCs for any COC not retained for quantitative assessment in the HHRA.

Tables 4-43~~2~~a and 4-43~~2~~b present the soil RBCs relevant to human health based on the inhalation of indoor air pathway for residential and commercial building uses, respectively. MECP generic soil-to-indoor-air component values based on building type (that is, the S-IA) were adopted as the inhalation RBCs for volatile COCs not retained for quantitative assessment in the HHRA.

Table 4-~~43~~ 44 shows the selection and basis of the overall soil RBCs protective of human health for a mixed residential, parkland, and commercial land use. If the calculated direct contact or inhalation RBC was less than the Table 6 SCS, the Table 6 SCS was selected as the overall soil RBC. VI RMMs are required for all future buildings at the RA Property (Section 7).

Fill cap target concentrations are presented in Section 6 of this document.

Additional human health RBCs were calculated to support the requirement to report the percentage reduction in COC concentrations associated with the proposed RMMs (Section 7).

Tables 4-~~44a~~ 45a and 4-~~44b~~ 45b present the dermal groundwater contact RBCs for potable water contact and Worker incidental contact in the subsurface, respectively.

Table 4-~~45a~~ 46a and 4-~~45b~~ 46b present the groundwater RBCs for the inhalation of indoor air pathway for the generic commercial and residential scenarios, respectively.

Table 4-4~~6~~7 presents the inhalation of trench air RBCs. Values are derived for the media (soil or groundwater) that was driving the risk for this pathway for each COC.

RBCs were developed based on the TRVs presented in Section 4.3. Uncertainties associated with variations in the TRVs could increase or decrease the RBC estimates. However, the conclusion that these RBCs are protective of Site receptors can be considered valid despite changes to the TRV, since the derivation of TRVs includes modifying factors and UFs that may span several orders of magnitude.

5. Ecological Risk Assessment (ERA)

This section of the RA primarily evaluates risk to ecological receptors at the RA Property, by addressing the elements required in the RA process. A semi-quantitative and qualitative Ecological Risk Assessment (ERA) was completed and deemed appropriate based on the RA Property's existing conditions and anticipated future use, and the implementation of a risk management plan (RMP). ERAs assess the potential for ecological risks resulting from contamination and the presence of contaminants of concern (COCs) at a site.

This ERA adheres to the prescribed O. Reg. 153/04 (as amended) (MECP 2011a) reporting format and includes the following five major elements:

1) Problem Formulation
2) Receptor Characterization
3) Exposure Assessment
4) Hazard Assessment
5) Risk Characterization

5.1 Problem Formulation

The problem formulation component of this ERA comprises a description of the ecological conceptual site model (EcoCSM) as it relates to ecological receptors, site characteristics, and potential routes of exposure. It defines the objectives of the ERA, and summarizes the data quality control and objectives.

5.1.1 Ecological Conceptual Site Model

An EcoCSM provides a basic description of how contaminants enter and are transported within a system, and where the routes of exposure to organisms potentially occur.

The RA is based on a fundamental understanding of site conditions (as discussed in Section 3, Property Information, Site Plan, and Geological Interpretation) and considers the nature and magnitude of the interaction between COCs in environmental media and valued ecosystem components (VECs).

The RA Property is 5.2 ha in area and consists of vacant land historically used for industrial purposes. All buildings previously onsite have been razed, with concrete floor slabs remaining in place. Since the Site has been vacant, various types of vegetation (including trees, shrubs, grasses, and weeds) have become naturally established along the property boundaries and between the remaining floor slabs (CH2M, 2017). No visual evidence of vegetation inferred to be stressed from contaminant influence was observed during the Site reconnaissance completed as part of the Phase One Environmental Site Assessment (CH2M, 2017).

Over the course of the Phase Two investigation activities, nonaqueous phase liquid NAPL has been measured at thicknesses of 0.002 and 0.97 m in six monitoring events between 2017 and 2020. Therefore, additional consideration of potential risks related to NAPL, and the potential need for additional RMMs due to the presence of NAPL, is warranted. Refer to Section 5.5.3.4.

No surface water or aquatic habitat is located on or within 30 metres (m) of the RA Property. Groundwater at the Site is potable, and generally flows south. Groundwater flow is influenced by groundwater pumping from municipal water supply wells, as well as rivers including the Eramosa River and Speed River.

COCs are contaminants found on, in, or under an RA property at concentrations that exceed the applicable Site Condition Standards (SCS). As a result, they may present risks to ecological receptors. The chemicals chosen for evaluation in this RA were identified, based on the known practices and activities that occurred at the RA Property, through a Phase One and Phase Two Environmental Site Assessment (ESA) process (Appendix D). COCs are present in soil and groundwater at the RA Property because of historical releases of chemicals to soil from former industrial activities with subsequent migration to groundwater, including an iron facility, machine shops, former rail spurs, and the placement of fill of unknown quality (CH2M 2017).

Soil pH was found to range from 6.6 to 10.64 based on 106 soil samples. With the exception of two samples, the soil samples were found to have a pH value within the MECP's acceptable range (that is, a pH value in surface soil between 5 and 9, or a pH value in subsurface soil between 5 and 11) (Jacobs 2020). The soil from one borehole was determined to be "isolated fill" and is not considered to be representative of soil conditions at the Site. At this location, concrete foundations were noted to be present both above and below the sample, essentially isolating this fill from other overburden soils. As such, this pH result was not considered further for the determination of pH at the RA Property. The second sample (MW17-100S, collected between 0.3 to 0.46 metres below ground surface [mbgs]) where a pH concentration of 9.45 was found was further investigated with BH19-100i, where three samples were collected from within 2 m of the original sampling location, at the same sampling depth as the original sample. The sample results reported a pH of 7.71, 7.78, and 7.79, which when averaged with the original sample, confirms pH at the Site is within the MECP's acceptable range with a result of 8.0 (sample averaging as per Section 48(2) of the O. Reg. 153/04; MECP 2011a).

Based on this information, the Table 6 *Generic Site Condition Standards for Shallow Soils in a Potable Ground Water Condition* for coarse-grained soils and residential/ parkland/ institutional property use (Table 6 SCS) (MECP 2011b) have been applied as the applicable SCS for RA purposes. Tables F1-1 (soil) and F1-2 (groundwater) in Appendix F1 provide detailed lists of COCs and their corresponding concentrations.

The following onsite receptors and pathways were considered in the ERA:

- Soil organisms (ingestion and dermal contact with soil)
- Terrestrial plants (root uptake from soil and groundwater)
- Birds and mammals (ingestion of soil, and ingestion of prey and food)

The ERA considers the following offsite receptors and pathways: pelagic invertebrates, fish, amphibians, and reptiles (dermal contact and ingestion of surface water), as well as aquatic plants (uptake of surface water through roots, leaves, and stems). Sections 5.2 (Receptor Characterization) and 5.3 (Exposure Assessment) provide additional details regarding the selection of ecological receptors and pathways, respectively.

Figure 5-1 presents the EcoCSM that was developed for the RA Property under current conditions. It was based on, and is consistent with, information gathered during site investigation activities and visits described in Section 3 and Appendix D. Section 5.3, Exposure Assessment, describes in more detail how the EcoCSM was developed and used in the ERA. Figure 5-2 illustrates the EcoCSM that is relevant after the RMP in Section 7 of this document is implemented.

5.1.2 Risk Assessment Objectives

The objectives of the ERA are to assess the potential risks to ecological receptors from COCs in soil and groundwater, and develop ecological property-specific standards (EPSSs), assuming COCs will be left in place and managed as required, using the RMP provided in Section 7 of this document. If warranted, soils

from specified areas may be removed from the RA Property; at that time, they will be managed per the RMP, tested, and disposed of as required by applicable legislation.

5.1.2.1 Proposed Land Use

The proposed land use within the RA Property will be mixed residential, parkland, and commercial use.

Constructed ornamental gardens or naturalized areas may be created as part of the redevelopment and could include mowed grass, trees, shrubs, herbaceous vegetation, or a combination thereof. The wildlife community under redevelopment conditions is expected to be dominated by mammals and birds tolerant of habitat disturbances and human activities within an urban setting, as well as species with a greater range, which migrate between habitats and areas.

5.1.2.2 Receptors and Pathways

VECs and exposure pathways to be semi-quantitatively evaluated include:

- Onsite soil organisms (earthworms) – ingestion and dermal contact with soil
- Onsite terrestrial plants (grasses and Manitoba Maple trees) —root uptake from soil and groundwater
- Onsite birds and mammals (American Woodcock, Red-winged Blackbird, and Red-tailed Hawk to represent birds; Meadow Vole, Red Fox, and Short-tailed Shrew to represent mammals) —ingestion of soil and food-chain transfer by the consumption of contaminated prey or forage items

VECs and exposure pathways to be qualitatively evaluated include:

- Offsite aquatic receptors – exposure to surface water influenced by Site groundwater
- Inhalation of volatiles and soil particulates for soil organisms, birds, and mammals
- Dermal contact with soil for birds and mammals
- Stem and foliar uptake of ambient air for terrestrial plants

The following pathways will be demonstrated as incomplete:

- Dermal contact with groundwater (soil organisms, birds, and mammals)
- Ingestion of surface water (birds and mammals)
- Offsite benthic receptors - migration of soil to a water body via erosion followed by direct contact

Section 5.2 describes the VECs selected for the RA Property in greater detail. The growth, reproduction, and survival of populations of the identified VECs are to be protected to a level consistent with that assumed by the MECP in the derivation of the generic SCS (MECP 2011c). The MECP values are set at "levels at or below lowest observable effects levels from controlled dose-response studies for the selected representative species showing the most sensitive response (effect) to a given contaminant dose (exposure)" (MECP 2011c). The selected level of protection is considered appropriate for the RA Property given the existing Site conditions, the proposed land use, and the intent to implement risk management measures (RMMs) to mitigate any risks to ecological health identified by the evaluation.

5.1.2.3 ERA Approach

A semi-quantitative and qualitative ERA was completed that involved comparisons of site media concentrations to established MECP ecological benchmark concentrations (EcoBMCs). Onsite terrestrial VECs were evaluated semi-quantitatively, while offsite aquatic VECs in downgradient waterbodies were evaluated qualitatively.

5.1.2.4 Data Quality Objectives and Uncertainties

Soil and groundwater sampling was either performed or supervised by Jacobs staff with experience in intrusive field investigation techniques and with the COCs encountered at the Site, under the supervision of a MECP Qualified Person for ESAs (QPESA). Soil and groundwater sampled by Jacobs between 2017 and 2020 were collected according to our standard operating procedures (SOPs), which were developed in accordance with O. Reg 153/04 (MECP 2011a). The selected analytical laboratories performed the chemical analysis in compliance with the MECP's Laboratory Services Branch Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act, as amended (MECP 2011d).

In combination with the field QA/QC program, a Jacobs project chemist has completed an evaluation of the laboratory QA/QC program to verify the accuracy, precision, and validity of the data reported by the laboratory. Various elements of the laboratory QA/QC program are used to evaluate the data: blanks are analyzed to detect laboratory contaminations that can cause data to be biased high; laboratory control samples are used to evaluate the laboratory performance; laboratory duplicates are used to measure precision in the laboratory; matrix spikes are used to identify high or low bias caused by matrix interference; and surrogate spikes are used to evaluate the method performance that can cause high or low bias in the data. Evaluation of the laboratory QA/QC program was performed by examining blanks, laboratory control samples, matrix spikes, and surrogate spike samples.

The groundwater and soil analytical data evaluated herein is considered valid. All results can be used to support the project decision making process. Appendix D2 provides additional details on the QA/QC program.

The current database includes soil and groundwater data from past investigations completed by other consultants. As discussed in Section 3.3.2, Jacobs determined that some historical soil data are useful for inclusion in the RA report. Appendix D2 lists the historical reports which were included as part of the Phase Two ESA.

Since the intent is to manage the potential risk associated with soil and groundwater contamination in place by using engineering controls as necessary, Jacobs considers the data collected to be adequate. Uncertainties associated with data quality are not likely to affect the objectives of the RA or the ability of current and future landowners to manage potential risks at the RA Property. Overall, the quality of data used in the RA were considered sufficient to meet the objectives of the HHRA and to be usable for RA decision making.

5.2 Receptor Characterization

Receptor characterization involves the following process:

- Identify terrestrial and aquatic resources, including Species at Risk (SAR).
- Identify VECs.
- Determine the effects against which to protect ecological receptors.

As the EcoCSM discusses, COCs from the RA Property have the potential to adversely affect terrestrial resources on the RA Property, as well as aquatic resources located offsite in downgradient waterbodies via groundwater flow to surface water. Therefore, the receptor characterization describes the terrestrial and aquatic resources and the biota that use the RA Property. Based on the resources and biota present, VECs and assessment and measurement endpoints were selected to facilitate the assessment.

VECs are specific ecological receptors determined to be of ecological importance at a site, considering the current and proposed land use. They are chosen to represent groups of species that are likely to inhabit a site and, as a result, may be affected by exposure to a chemical or other stressor. The representative VECs were selected for this ERA considering:

- Their habitat preferences
- Their potential presence on the RA Property
- Whether the species was indigenous to the area
- The availability of toxicological literature for the species
- Representation of a trophic level or feeding guild

5.2.1 Species at Risk

The *Species at Risk Act* (SARA) provides protection for wildlife species (listed on Schedule 1 of the SARA) and critical habitat. The federal government's responsibilities for listed aquatic species and birds are covered by the *Fisheries Act* and the *Migratory Birds Convention Act*, respectively; prohibitions apply to these species wherever they are found in Canada. For all other species, SARA applies on federal lands only. However, species not protected by SARA may otherwise be protected through provincial legislation. In Ontario, those with provincial designations of Species at Risk are protected under the *Ontario Endangered Species Act*. Both acts use the same designation categories, starting with the greatest concern, and then moving from extirpated, endangered, and threatened, to special concern.

The designation of species of national significance is assigned by the Committee on the Status of Endangered Wildlife in Canada. The designation of species of Provincial significance is assigned by the Ontario Ministry of Natural Resources and Forestry (MNRF) (Ontario General Status), and is based on recommendations made by the Committee on the Status of Species at Risk in Ontario.

Jacobs completed a search using the MNRF (2020) Natural Heritage Information Centre (NHIC), as this database presents actual species observations. The NHIC search revealed observations of 9 species within 1 square kilometre (km^2) of the RA Property. The entire RA Property falls within the 17NJ6222 regional square. The RA Property falls within 1 kilometre (km) of the following regional squares: 17NJ6121 through 17NJ6123, 17NJ6221, 17NJ6223, and 17NJ6321 through 17NJ6323. The observed dates for Species at Risk occurrences range from 1913 to 1978.

Table 5-1 summarizes the Species at Risk that have been identified in the area at some time, along with their species status and their preferred habitat. Given the level of development, amount of disturbance (for example, surrounding industrial and commercial properties around the Site), last recorded dates of observances, and site characteristics compared to Species at Risk habitat preferences, these Species at Risk are unlikely to be present or to be adversely affected by work at the RA Property.

5.2.2 Terrestrial Resources and Selection of Valued Ecosystem Components

Under current conditions, the RA Property is vacant, with the majority of concrete floors, foundations and footings of historical buildings remaining in place. Fill was found across the RA Property from ground surface to a depth of 0.1 to 3.1 mbgs. Low wildlife and plant species diversity is expected on the RA Property because of limited habitat diversity and availability.

Due to the lack of nearby surface water and the Site conditions, there is no habitat suitable for amphibians onsite and habitat for reptiles is considered to limited onsite. However, habitat for amphibians and aquatic reptiles (turtles) is present offsite within the Eramosa River. The data and the methods needed to estimate exposure and evaluate toxicity for these receptors are generally not available (Hopkins 2000, MECP 2011b); therefore, these receptors were not quantitatively assessed in this ERA for the RA Property, but

were assumed to be protected if other wildlife were. Section 5.5.3.2 provides a qualitative discussion of reptiles onsite. Amphibians and reptiles were, however, considered qualitatively for the Eramosa River (offsite).

Based on the terrestrial resources and the presence of COCs in soil and groundwater, the ecological receptors chosen for assessment were soil organisms, terrestrial plants, birds, and mammals consistent with the MECP's Rationale Document (MECP 2011b). A semi-quantitative assessment was completed that involved comparisons of site media concentrations to established MECP EcoBMCs and calculating a risk. Section 5.2.4 of the MECP's Rationale Document (MECP 2011b) provides the receptor characteristics for the birds and mammals considered in the development of those EcoBMCs (provided as Table G4-1 in Appendix G4). Population-level assessments were deemed appropriate for this ERA.

Based on current and future site conditions, ERA objectives, and the exposure pathways to be assessed, the terrestrial VECs evaluated in this RA include:

Soil Organisms

- Earthworms – A soil invertebrate that is ubiquitous with high exposure to soil (via dermal contact and ingestion). A food source for many wildlife species.

Plants

- Grasses and Manitoba Maple trees (*Acer negundo*)— All vegetation is considered sessile with high exposure to soil via root contact and uptake. Root contact and uptake with groundwater may also be possible.

Birds

- American Woodcock (*Scolopax minor*)— A vermivorus or omnivorous bird (MECP 2011b). Exposure to Site COCs may occur via direct contact while foraging onsite or via the diet (primary food source is invertebrates).
- Red-winged Blackbird (*Agelaius phoeniceus*— An herbivorous or granivorous bird (MECP 2011b). Exposure to Site COCs may occur via direct contact while foraging onsite or via the diet (primary food source is plants).
- Red-tailed Hawk (*Buteo jamaicensis*)—A carnivorous bird (MECP 2011b). Exposure to Site COCs may occur via direct contact while hunting onsite or via the diet (primary food source is mammals).

Table G4-1 in Appendix G4 provides the MECP receptor characteristics for birds including body weights, food ingestion rates, soil ingestion rates, inhalation rates, and skin surface areas.

Mammals

- Meadow Vole (*Microtus pennsylvanicus)*—An herbivorous mammal (MECP 2011b). Exposure to Site COCs may occur via direct contact while foraging or residing onsite or via the diet (primary food source is plants).
- Red Fox (*Vulpes vulpes*)—A carnivorous mammal (MECP 2011b). Exposure to Site COCs may occur via direct contact while foraging onsite or via the diet (primary food source is mammals).
- Short-tailed Shrew (*Blarina brevicauda*)—A vermivorous or omnivorous mammal (MECP 2011b). Site COCs may occur via direct contact while foraging or residing onsite or via the diet (primary food source is invertebrates).

Table G4-1 in Appendix G4 provides the MECP receptor characteristics for mammals including body weights, food ingestion rates, soil ingestion rates, inhalation rates, and skin surface areas.

The terrestrial vegetation was observed onsite, in the surrounding area, or both; and the bird and mammal species, while not directly observed, could be located onsite based on Site conditions and habitat requirements.

Table 5-2 lists the species chosen as VECs for this assessment.

5.2.3 Aquatic Resources and Selection of Valued Ecological Components

No aquatic resources (for example, streams or ponds) are currently located on the RA Property. The nearest offsite water body is the Eramosa River, located approximately 0.5 km to the south of the Site, and the Speed River, located approximately 1.1 km west of the Site.

The RA Property is located within the Speed River Subwatershed of the Grand River Watershed. Both the Eramosa River and the Speed River are influenced by groundwater discharge, and groundwater flow within the City of Guelph is influenced by groundwater pumping from municipal water supply wells (Jacobs 2020).

The Grand River Watershed provides habitat for numerous aquatic species common to Southern Ontario (including aquatic Species at Risk). More than 90 species of fish, about half of all species in Canada, are found within the river system part of this watershed (GRCA 2020a).

Common species within the Eramosa River include smallmouth bass (*Micropterus dolomieu*), brook trout (*Salvelinus fontinalis*), brown trout (*Salmo trutta*), and northern pike (*Esox lucius*) (GRCA 2020b).

Based on the aquatic resources present within the Eramosa River, which is downgradient of the RA Property, the ecological receptors chosen for assessment were pelagic invertebrates, fish, amphibians, reptiles (that is, turtles), and aquatic plants. A qualitative assessment of the potential for offsite risks was completed, which involved comparing groundwater concentrations against established MECP EcoBMCs (MECP 2011b) for water-mediated exposures. Population-level assessments were deemed appropriate for this ERA.

For aquatic VECs, the species selected include:

Pelagic Invertebrates

- Daphnia—An algivorous and planktivorous waterflea (Elenbaas 2014) with continuous exposure to surface water. A food source for many aquatic species. Exposure to Site COCs may occur via direct contact (dermal and ingestion) of surface water influenced by onsite groundwater via discharge to the water body.

Fish

- Common Shiner (*Luxilus comutus*)—An invertivorous fish (Eakins 2019) with continuous exposure to surface water. Exposure to Site COCs may occur via direct contact (dermal and ingestion) of surface water influenced by onsite groundwater via discharge to the water body or via the diet.
- Northern Pike (*Esox lucius*)— A piscivorous fish (Eakins 2019) with continuous exposure to surface water. Exposure to Site COCs may occur via direct contact (dermal and ingestion) of surface water influenced by onsite groundwater via discharge to the water body or via the diet.

Amphibians

- Green Frog (*Rana clamitans*) to represent amphibians—A carnivorous frog (AmphibiaWeb 2019) with high exposure to surface water and sediment. Exposure to Site COCs may occur via direct contact (dermal and ingestion) of surface water or sediment (influenced by onsite groundwater or soil) or via the diet.

Aquatic Reptiles

- Midland Painted Turtle (*Chrysemys picta marginata*) to represent aquatic reptiles—An omnivorous turtle (Ontario Nature 2019) with high exposure to surface water and sediment. Exposure to Site COCs may occur via direct contact (dermal and ingestion) of surface water or sediment (influenced by onsite groundwater or soil) or via the diet.

Aquatic Plants

- *Carex spp*.— Aquatic vegetation is considered sessile with high exposure to surface water and sediment. Exposure to Site COCs may occur via uptake of surface water or sediment through roots, leaves, and stems.

These aquatic and riparian receptors could be located offsite within the Eramosa River based on site conditions and habitat requirements.

Table 5-2 lists the species chosen as VECs for this assessment.

5.2.4 Assessment Endpoints

Assessment endpoints are explicit expressions of the actual environmental value to be protected. They are developed based on information concerning the chemicals present and site characteristics, and they must represent a property of the system that can be measured. These endpoints can be operationally defined as comprising an entity and an attribute (Suter 1995, EPA 1998). The entity is the specific environmental component of interest (for this assessment, represented by the VECs identified in Table 5-2). The attribute represents characteristics of the entity that may be affected by exposure to COCs.

Explicit in the assessment endpoint definition is the level of ecological organization. Entities and attributes were selected for the population-level ecological organizational level. Based on current conditions, ERA objectives, and VECs selected for protection, entities and attributes evaluated in this assessment included the growth, reproduction, and survival of populations of the identified VECs.

5.2.5 Measurement Endpoints

Measurement endpoints are evaluated to indicate whether adverse effects to assessment endpoints have occurred or are likely to occur. Measurement endpoints are measurable changes in an attribute of an assessment endpoint or its surrogate in response to a stressor (for example, chemical or physical impact) to which it is exposed.

As noted, the Table 6 SCS were used in the identification of soil and groundwater COCs for the RA Property.

5.3 Exposure Assessment

Exposure assessment is the evaluation of the potential exposure of ecological receptors and VECs to COCs. The exposure assessment identified the COCs; pathways by which VECs were potentially exposed to COCs; and the magnitude, frequency, and duration of the actual or potential exposure.

5.3.1 Pathway Analysis

An exposure pathway can be described as the physical course a chemical takes from the point of release to a receptor. An exposure pathway is complete (that is, there is exposure) if there is a way for the receptor to take in chemicals through ingestion, inhalation, or dermal absorption. To be complete, an exposure pathway must have a chemical source, a mechanism for chemical release, an environmental transport medium, an exposure point, and a feasible route of intake. In the absence of any one of these components, an exposure pathway is considered incomplete, and, by definition, there can be no risk associated with that exposure pathway. Exposure can occur when chemicals migrate from their source to an exposure point (that is, a location where receptors can contact the chemicals) or when a receptor moves into direct contact with chemicals or contaminated media.

Table 5-3 presents the pathway analysis for this ERA, which describes and evaluates how COCs from a source are transferred through a contaminated medium to the VECs.

Soil organisms can absorb chemicals from soil through the epidermis or may ingest soil during feeding or burrowing.

Terrestrial plants can absorb and store chemicals from environmental media through roots, leaves, or stems. Section 5.5.3.1 justifies that stem and foliar uptake of ambient air for terrestrial plants is a minor or secondary pathway and was not quantitatively assessed. Terrestrial plant root uptake from groundwater was considered a potentially complete pathway.

Birds and mammals may be exposed to COCs through dermal contact, the inhalation and ingestion of soil, the ingestion of surface water, and through the food chain by the consumption of contaminated prey (for example, earthworms) or foraged items (for example, terrestrial plants). Indirect risks from groundwater to birds and mammals via the consumption of terrestrial plants (in contact with the water table) is possible. This indirect exposure pathway is qualitatively assessed based on the terrestrial plant uptake from groundwater pathway in Section 5.5.3.3. Dermal contact and the inhalation of volatiles and particulates were not quantitatively assessed for birds and mammals and are justified as minor or secondary pathways in Section 5.5.3.1.

Groundwater effects on soil organisms, birds, and mammals were not assessed. This is because dermal contact with groundwater for soil organisms, birds, and mammals was considered a minor exposure route. These receptors avoid saturated ground conditions, there is a lack of data to adequately evaluate these effects, and risks to these ecological receptors are better assessed through the evaluation of other exposure pathways.

No surface water is located on the RA Property; therefore, the ingestion of surface water pathway is considered incomplete for onsite terrestrial receptors.

Offsite pelagic invertebrates, fish, amphibians, and aquatic reptiles may be exposed to chemicals in surface water through ingestion and dermal contact.

For aquatic plants growing within offsite waterbodies the major route of exposure is from surface water through their roots, leaves, and stems.

Dermal contact and ingestion of soil (as sediment) for benthic invertebrates was not assessed. This is because no water bodies are located onsite or within 30 m of the RA Property, and the migration of soil via erosion to a water body is not a complete pathway.

In summary, the primary routes of exposure that were semi-quantitatively evaluated are:

- Soil organisms – ingestion and dermal contact with soil
- Terrestrial plants—root uptake from soil and groundwater
- Birds and mammals—ingestion of soil and food-chain transfer by the consumption of contaminated prey or forage items

Section 5.5.3.1 contains the qualitative evaluation of the minor or secondary pathways identified in Table 5-3 for onsite receptors, including:

- Inhalation of volatiles and soil particulates for soil organisms, birds, and mammals
- Stem and foliar uptake of ambient air for terrestrial plants
- Dermal contact with soil for birds and mammals

Section 5.5.3.4 contains the qualitative assessment of offsite aquatic receptors exposed to surface water influenced by Site groundwater.

Pathways considered incomplete include:

- Dermal contact with groundwater (soil organisms, birds, and mammals) because soil organisms and burrowing birds and mammals would avoid saturated soils
- Ingestion of surface water (birds and mammals) because no surface water is present onsite
- Dermal contact and ingestion of soil (as sediment) for benthic invertebrates because no surface water is present onsite or within 30 m of the RA Property.

5.3.2 Exposure Estimates

The exposure assessment describes and quantifies the nature and magnitude of the interaction between COCs in environmental media and VECs. The frequency and duration of exposure to contaminated media is assumed as follows:

- Terrestrial Plants – Continuous, as plants are sessile.
- Soil invertebrates, Birds, and Mammals – Continuous, per MECP (2011b) assumption that all of the RA Property is considered suitable habitat for each VEC and that all incidental soil ingestion and food ingestion exposures occur within the RA Property.

Exposure can be represented in various ways (Government of Canada 2012), including:

- A measured concentration in an environmental medium (for example, micrograms [µg] per gram [µg/g] of a chemical in soil or µg per litre [µg/L] of a chemical in water)
- An estimated concentration in a tissue via modelling (for example, the chemical concentration in a plant via uptake of soil)

- An estimated dose to an organism via modelling (for example, milligrams per kilogram per day [mg/kg/d] from the food chain)

For this ERA, measured chemical concentrations in soil and groundwater are used to represent exposure. COCs are contaminants found on, in, or under a property at concentrations that exceed its applicable SCS. As a result, they may present risks to ecological receptors. The chemicals chosen for evaluation in this RA were identified based on the known practices and activities that have occurred at the RA Property (refer to the ESA summaries in Appendix D). Appendix F1 (Tables F1-1 and F1-2) provides detailed lists of RA Property COCs and the maximum observed concentration of each COC in soil and groundwater, respectively.

5.3.2.1 Soil

The pathway analysis for soil organisms (earthworms), terrestrial plants (grasses and Manitoba Maple trees), birds (Red-tailed Hawk, American Woodcock, and Red-winged Black Bird), and mammals (Red Fox, Meadow Vole, and Short-tailed Shrew) indicated they can be exposed to, and are at risk from, COCs in soil. Consideration must be given to COCs that can biomagnify, resulting in increased exposure and risk to higher trophic organisms. The uptake of COCs by soil organisms and plants and the consumption of these VECs by higher trophic bird and mammal species have the potential to impact the growth, reproduction, and survival of these species through dietary exposure. The generic MECP SCS (2011c) considers biomagnification, food-chain effects, and dietary exposure. Therefore, the food chain and diet pathway, including biomagnification potential, has been evaluated for the VECs identified as part of this ERA. The frequency and duration of exposure of VECs to COCs in soil are assumed to be similar to those assumed by the MECP in the derivation of the generic SCS.

To assess potential risks to terrestrial VECs from COCs in soil and diet, the maximum observed concentrations in soil were compared to the Table 6 SCS. Based on this comparison, ~~38~~ 42 COCs were retained for soil at the RA Property (Appendix F1, Table F1-1).

The estimated maximum concentrations of these ~~38~~ 42 chemicals (calculated based on the observed maximum plus 20 percent) represent terrestrial receptor exposure to soil (Table 5-4). If the observed maximum concentration of a chemical was based on a method detection limit (MDL), the observed maximum was selected as the estimated maximum concentration.

5.3.2.2 Groundwater

The pathway analysis for terrestrial plants (grasses and Manitoba maple trees) indicated they can be exposed to and at risk from COCs in groundwater because the minimum depth of groundwater (0.93 mbgs) is less than 1.5 mbgs. Contaminants in groundwater within the rooting zone (generally 1.5 mbgs[1] or shallower) have the potential to affect terrestrial vegetation.

The pathway analysis for aquatic receptors indicated they could be exposed to groundwater migrating from the RA Property to the nearest downgradient surface water body (that is, the Eramosa River). Pelagic invertebrates, fish, amphibians, aquatic reptiles, and aquatic plants experience water-mediated exposures, which are measured as a function of the concentration of contaminants in surface water (for example, micrograms of chemical per litre of water). These ecological receptors within the downgradient waterbodies could be exposed to groundwater COCs from the RA Property. The frequency and duration of

[1] Root zone inferred from MECP (2011c) which indicates that plant protection in subsurface soil (that is, below the root zone) is not a significant concern. MECP (2011a) defines subsurface soil as "more than 1.5 m below the soil surface".

exposure of VECs to COCs in groundwater are assumed to be similar to those assumed by the MECP in the derivation of the generic SCS.

To assess potential risks to offsite aquatic VECs in downgradient waterbodies and terrestrial plants from COCs in groundwater, the maximum observed concentrations in groundwater were compared to the Table 6 SCS. Based on this comparison, 30 COCs were retained in groundwater for the RA Property (Appendix F1, Table F1-2).

The estimated maximum concentrations of the 30 COCs in groundwater (calculated based on the observed maximum, plus 20 percent) represent terrestrial plants and offsite aquatic receptor exposure to groundwater (Table 5-5).

5.3.3 Discussion of Uncertainty

As is typical for most site investigations and RAs, it is possible that greater or lesser concentrations of chemicals exist onsite compared to those currently measured. This ERA employed a conservative approach to address the potential underestimation of risks by using the maximum and estimated maximum concentrations of COCs in soil and groundwater.

The bioavailability of all COCs in all environmental media was assumed to be 100 percent. The bioavailability of each COC was assumed to be equivalent to that observed or assumed within the study upon which the applied EcoBMC was based. These assumptions tend to overestimate exposure, but would not be expected to affect the conclusions of the ERA.

The assumption that all exposures related to food and soil ingestion occur on the RA Property is conservative. The home or foraging range of mobile VECs is unlikely to be confined to the RA Property; therefore, these assumptions have likely overestimated VEC exposure.

This assessment assumed the food and soil ingestion rates, body weights, and diet composition proportioning employed by the MECP (refer to Table G4-1 in Appendix G4) to evaluate exposure applied to the receptors at the RA Property. There is uncertainty with these uptake factors and the regression equations used by the MECP to estimate concentrations of chemicals in plants, earthworms, and mammals from exposure to soil and ingestion of food (diet). However, these approaches have been developed by the scientific community to provide an alternate method of assessing the potential for ecological risks in the absence of site-specific data (for example, plant, invertebrate, or mammal tissue). Therefore, chemical uptake may be under- or over-estimated.

Overall, the combination of several conservative assumptions in the exposure assessment have likely resulted in an overestimation of exposure to VECs in the ERA.

5.4 Hazard Assessment

Hazard assessments determine the potential for COCs to adversely affect the VECs, and involve evaluating scientific data for relevance to the assessment endpoints and the EcoCSM. If the concentrations of COCs exceed threshold effect levels, adverse effects to the survival, growth, or reproduction of VECs residing at the RA Property may be possible. Threshold effect levels can be represented in various ways (Government of Canada 2012):

- A guideline for environmental media (for example, soil or groundwater)
- A threshold value derived from toxicological summaries or a literature review
- A threshold value developed from site-specific toxicity testing or studies

For this ERA, the threshold effect levels are referred to as EcoBMCs. These values are represented by regulatory guidelines derived to be protective of the receptor groups and pathways discussed in Sections 5.2 and 5.3.1, respectively.

5.4.1 Soil

Multiple COCs were determined to potentially adversely affect the growth, reproduction, and survival of populations of soil organisms (earthworms), terrestrial plants (grasses and Manitoba Maple trees), birds (American Woodcock, Red-tailed Hawk, and Red-winged Blackbird), and mammals (Meadow Vole, Red Fox, and Short-tailed Shrew), based on comparisons to the MECP Table 6 SCS, which are based on both human health and ecological toxicological data.

EcoBMCs were identified as part of the hazard assessment to focus the assessment on ecological effects. The MECP ecotoxicological component values provided in the Rationale Document (MECP 2011b) were the primary source of EcoBMCs. As the Table 6 SCS component values are based on the Table 2 Standard (*Table 2: Full Depth Generic Site Condition Standards in a Potable Ground Water Condition)*, the component values associated with the Table 2 Standard (residential/parkland/ institutional; coarse soil texture) were used. Alternate sources of EcoBMCs were used to facilitate the assessment of other COCs for which no MECP EcoBMC was available or if only one MECP EcoBMC existed (for example, an MECP soil organism or plant EcoBMC was available, but no MECP bird or mammal EcoBMC existed). Canadian Council of Ministers of the Environment (CCME), provincial, U.S. Environmental Protection Agency (EPA), and other reference sources were searched for relevant EcoBMCs. Based on jurisdictional relevancy and MECP preference[2], CCME EcoBMCs were reviewed and used first, followed by those from provincial, EPA, and other reference sources, as needed. The CCME, provincial (Alberta Environment and Parks [AEP]), MECP, and EPA EcoBMCs were considered appropriate for use in this ERA, as they have been peer-reviewed and are supported by regulators.

CCME (2008) values for PHCs are similar to the MECP ecological component values in that they are also protective of terrestrial receptors through the soil and food ingestion pathways. The derivation of these values is provided in the document entitled *Canada-Wide Standard for Petroleum Hydrocarbons (PHC) in Soil: Scientific Rationale, Supporting Technical Document* (CCME 2008). The MECP actively participated in the "development of protocols for setting effects-based soil quality criteria" (MECP 2011b) for CCME documents (CCME 2006, 2008); therefore, EcoBMCs from this source are considered to afford a similar level of protection to ecological receptors as the MECP component values and are appropriate for use in this ERA.

AEP (2019) values for PHCs are similar to the CCME guidelines and MECP ecological component values in that they are also protective of terrestrial receptors through the soil and food ingestion pathways. The CCME (and by extension, the MECP) have not provided PHC values applicable to birds and mammals on the basis that this "pathway is negligible for birds and mammals since PHCs do not accumulate in plant tissue (diet) and are readily metabolized and excreted by vertebrates" (CCME 2008). AEP (2019) has evaluated this pathway for soil ingestion only, noting the same assumption as CCME in regard to the diet pathway. AEP only derives values for this pathway under the Natural Areas and Agricultural land use categories. The values for a Natural Area were adopted for this ERA and are considered sufficiently protective of birds and mammals that may inhabit the RA Property. AEP adopts the CCME methodology for the derivation of soil and groundwater criteria; therefore, EcoBMCs from this source are considered to afford a similar level of protection to ecological receptors as the MECP component values and are appropriate for use in this ERA.

The EPA Office of Solid Waste and Emergency Response has published Interim Ecological Soil Screening Level (Eco-SSL) documents for some metals and pesticides, as well as polycyclic aromatic hydrocarbons and

[2] Refer to Section 5.3 of the Rationale Document (MECP, 2011b).

polychlorinated biphenyls. The derivation of the Eco-SSLs is provided in the document entitled *Guidance for Developing Ecological Soil Screening Levels* (EPA 2005). These values have been derived in a manner similar to the MECP component values, and are protective of one or more of plants, soil invertebrates, birds, and mammals via direct or indirect contact with soil (including food chain). Based on these considerations, EcoBMCs from this source are considered to afford a similar level of protection to ecological receptors as the MECP component values and are appropriate for use in this ERA.

The Oregon Department of Environmental Quality has adopted criteria from various sources as part of their 2001 document entitled *Guidance for Ecological Risk Assessment*. The Level II values are intended as screening values for the purposes of ecological risk assessments and are not to be used as remediation targets. Only a plant value for bismuth was available from this source. In the absence of other available screening values for bismuth, this value was deemed to be sufficient for use in the ERA for the evaluation of terrestrial organisms and plants.

Ontario Typical Range (OTR) values (MECP 2011b) were adopted as the EcoBMCs for the assessment of calcium, iron, and magnesium. A literature search did not identify any published effects-based EcoBMCs for these COCs.

An EcoBMC protective of birds and mammals for bismuth was not available. This COC was assessed qualitatively (Section 5.5.3).

Tables 5-6a and 5-6b summarize selected EcoBMCs used for the hazard assessment for plants and soil organisms, and birds and mammals, respectively. The source of each EcoBMC is also included in Tables 5-6a and 5-6b. These EcoBMCs were considered relevant for the assessment of risks at the RA Property.

5.4.2 Groundwater

EcoBMCs are not readily available to support the assessment of ecological risks related to terrestrial plant exposure to groundwater COCs. The MECP's Table 2 Standard[3] groundwater-to-surface water (GW3) component values (protective of aquatic receptors via the groundwater-to-surface water pathway) were applied as the EcoBMCs for this pathway, since the GW3 values for groundwater are considered protective of terrestrial plants (that is, risks exceeding acceptable levels would not be expected at the GW3 concentrations). Table 5-7a summarizes the source and concentration of the groundwater EcoBMCs used for the risk characterization assessment of terrestrial plants.

The potential for risks to aquatic receptors in the nearest downgradient surface water body (that is, Eramosa River) from groundwater leaving the RA Property was determined using the MECP (2011b) Table 6 GW3 component values. Table 5-7b summarizes the source and concentration of the groundwater EcoBMCs used for the hazard assessment of offsite aquatic receptors.

The MECP (2011b) has also published soil values that are protective of aquatic receptors from COCs in soil leaching to groundwater with subsequent discharge to surface water (S-GW3). Table F1-5a in Appendix F1 presents the S-GW3 component values (Table 2 values were used in the absence of Table 6-specific values); note, the MECP did not develop S-GW3 values for metals and inorganics (except for mercury), petroleum hydrocarbon (PHC) fraction (F)3, or PHC F4, as these compounds are not considered mobile or are not significantly mobile under normal soil conditions (for example, if soil pH is within the acceptable range). The development of S-GW3 assumes soils are located 36.5 m away from surface water (MECP 2016); however, the nearest surface water body from the RA property is 500 m away. Therefore, Jacobs

[3] While the Table 6 SCS is applicable to the RA Property in general, use of the Table 2 GW3 values are considered appropriate for the evaluation of potential risks to terrestrial plants.

calculated site-specific S-GW3s based on the distance of 500 m to the nearest surface water body using the MECP's Modified Generic Risk Assessment (MGRA) model (MECP 2016).

Based on the comparison to the site-specific S-GW3, three soil COCs were identified with estimated maximum concentrations in soil greater than the site-specific S-GW3 component value within the RA Property:

1) Acenaphthylene
2) Anthracene
3) PHC F2

The S-GW3 values are calculated using GW3 values, combined with partitioning and transport models. As an intermediate step in the MECP's calculation of the S-GW3 soil values, concentrations of COCs in groundwater that have leached from soil are estimated. However, site-specific groundwater data are available to directly consider groundwater concentrations, as data from 94 monitoring well locations across the RA Property are included in the RA dataset (refer to Appendix D2). These measured groundwater concentrations provide a more direct and site-specific reflection of actual groundwater conditions, including potential leaching from soil. Of the three COCs with soil concentrations greater than the site-specific S-GW3, all three parameters were retained for further assessment in groundwater based on its maximum observed groundwater concentration exceeding the generic Table 6 SCS (refer to Table F1-2 in Appendix F1).

Contamination at the RA Property resulted from historical sources. The RA considers groundwater data from 2007 to 2020; therefore, the past and present potential for contaminant leaching to groundwater is reflected by the currently measured groundwater concentrations. Based on this information, potential risks to offsite aquatic receptors from RA Property groundwater were evaluated primarily by comparing measured groundwater concentrations to the GW3 values. Table F1-5e in Appendix F1 presents the GW3 component values. As the RA Property is considered a shallow soil property, the Table 6 GW3 values cannot be modified in the MGRA model to account for the site-specific distance of the groundwater impacts to the water body as "one cannot assume that dilution occurs in the bedrock aquifer" (MECP, 2011b). Consequently, the calculation of site-specific GW3 values using the MGRA model was not applicable.

Based on the comparison to the generic Table 6 GW3 values, ten groundwater COCs were identified with estimated maximum concentrations greater than the GW3 component value within the RA Property:

1) Anthracene
2) Benzo(a)anthracene
3) Benzo(a)pyrene
4) Benzo(b&j)fluoranthene
5) Benzo(k)fluoranthene
6) Chrysene
7) PHC F1
8) PHC F2
9) Pyrene
10) Zinc

Estimated maximum concentrations of COCs in groundwater greater than the GW3 component values indicate a potential impact to the growth, reproduction, or survival, or some combination of these, of populations of pelagic invertebrates, fish, amphibians, aquatic reptiles, and aquatic plants in the nearest downgradient surface water bodies (that is, the Eramosa River). Table F1-5e in Appendix F1 lists the GW3 values used for the hazard assessment of aquatic receptors in offsite water bodies.

5.4.3 Uncertainty

For the hazard assessment, there is uncertainty related to the EcoBMCs used, especially as there are no reference values specific to the RA Property or to ecological receptors inhabiting the area. Toxicity assessments rarely incorporate direct data about the effects of environmental chemicals on wildlife receptors, including those likely to inhabit the RA Property. Toxicity data are typically obtained from tests completed using approved test species that are exposed under controlled, laboratory conditions. As a result, there are uncertainties about applying the literature-based toxicity data toward the development of receptor-specific exposure limits and in extrapolating the laboratory toxicity data to field conditions. These uncertainties include the use of VECs to represent receptors that actually inhabit a site, the use of interactions within chemical mixtures, and the use of different species and differently sized animals to assess effects.

There is some uncertainty regarding the level of protection afforded to ecological receptors at the RA Property by using non-MECP criteria. However, the regulatory guidelines and benchmark values from other jurisdictions that were used in this assessment were considered appropriate and sufficiently protective, as they were set using a conservative approach, similar to the approach used by the MECP in the derivation of the ecological component values, and have undergone peer review by credible specialists, regulatory bodies, and academia.

5.5 Risk Characterization

5.5.1 Interpretation of Ecological Risks

Risk characterization integrates the results of the exposure and hazard assessments to estimate risks (the likelihood of effects given the exposure). The risk attributable from each COC to the identified VECs is provided semi-quantitatively (primarily through use of the hazard quotient [HQ] method) and qualitatively in Sections 5.5.2 and 5.5.3, respectively.

5.5.2 Quantitative Interpretation of Ecological Risks

Risks to ecological receptors and VECs were semi-quantitatively evaluated using an HQ method, which is a unitless ratio between the exposure and the response (Government of Canada 2012), given by the following equation:

$$HQ = Exposure/Threshold\ Effect\ Level$$

As Sections 5.3.2 and 5.4 discuss, there are several ways that the exposure and threshold effect level terms in the HQ equation can be represented. This assessment employs media concentrations (as the exposure term) and regulatory benchmark concentrations (as the threshold effective level term) to determine the potential for effects (per CCME [1997]). Therefore, the specific HQ formula variation employed in this ERA is as follows:

$$HQ = Media\ Concentration/Benchmark\ Concentration$$

Where:

Media Concentration = estimated maximum concentrations in soil or groundwater at the RA Property.

Benchmark Concentration = MECP ecological component values (or equivalent value from a credible agency) (that is, EcoBMCs).

If the HQ is less than or equal to 1, risks greater than MECP limits for ecological receptors are unlikely to occur. If the HQ is greater than 1, there is a potential risk to the identified receptor at levels greater than MECP limits. Uncertainties that may influence the risk estimates and, therefore, the risk conclusions, are summarized following the risk characterization.

Section 5.5.4 discusses the development of proposed EPSSs based on the semi-quantitative assessment. In all cases, Jacobs adopted the estimated maximum concentration of each COC as the EPSS; RMMs were proposed where HQs greater than 1 were estimated based on the semi-quantitative assessment.

5.5.2.1 Soil

COCs were identified based on a comparison of soil concentrations from previous investigations to the Table 6 SCS. Concentrations of these COCs were then compared to the EcoBMCs presented in Tables 5-6a (plants and soil organisms) and 5-6b (birds and mammals), and an HQ was calculated.

As Table 5-8a shows, HQ values for terrestrial plants and soil organisms ranged from less than 1 to 480. The greatest HQ value is associated with benzo(a)anthracene (HQ of 480), followed by naphthalene (HQ of 430), indeno(1,2,3-cd)pyrene (HQ of 250), and zinc (HQ of 200).

As Table 5-8b shows, HQ values for birds and mammals for the ingestion of soil and diet and food chain pathways ranged from less than 1 to 1100. The greatest HQ is associated with fluoranthene (HQ of 1100), followed by lead (HQ of 380), zinc (HQ of 240), and benzo(a)anthracene (HQ of 220).

COCs with HQs greater than 1 are considered to possibly pose risks greater than the MECP limit to soil organisms (earthworms), terrestrial plants (grasses and Manitoba Maple trees), birds (Red-tailed Hawk, American Woodcock and Red-winged Black Bird), and mammals (Red Fox, Meadow Vole, and Short-tailed Shrew) residing at the RA Property, if RMMs are not implemented. For this reason, Jacobs recommends actions to reduce risks to ecological receptors from COCs in soil (Section 7).

5.5.2.2 Groundwater

COCs were identified, based on a comparison of groundwater concentrations from the Phase Two investigation to the Table 6 SCS. Concentrations of these COCs were then compared to the EcoBMCs presented in Table 5-7a for terrestrial plants and an HQ was calculated.

As Table 5-9 shows, HQ values for terrestrial plant uptake of groundwater ranged from less than 1 to 1500. The greatest HQ is associated with PHC F2 (HQ of 1500), followed by chrysene (HQ of 64) and anthracene (HQ of 37). Groundwater EcoBMCs protective of terrestrial plants have not been derived for heavy PHC fractions (F3 and F4) by regulatory agencies (MECP 2011b, CCME 2008; and Atlantic PIRI, 2012) because these fractions are “considered insufficiently soluble to migrate to groundwater from soil” (Atlantic PIRI 2012). However, for this RA, the presence of petroleum-related NAPL may pose a risk to terrestrial plants via uptake from PHC F3 and PHC F4; therefore, the HQs for these COCs are assumed to be greater than one.

COCs with HQs greater than 1 are considered to pose possible risks to terrestrial plants (grasses and Manitoba maple trees) residing at the RA Property, if RMMs are not implemented. For the COCs with an HQ greater than 1, the exceedances were limited to groundwater collected from wells located within the northeastern portion of the RA Property.

PHC (Fractions 1 and 2) with an HQ greater than 1, or an assumed HQ greater than 1 (Fractions 3 and 4)[4] were limited to groundwater collected from 6 wells:

- OW22S (screened from 1.36 to 4.1 mbgs)
- OW23S (screened from 2.52 to 5.26 mbgs)
- OW23D (screened from 6.55 to 7.77 mbgs)
- OW24D (screened from 6.55 to 7.77 mbgs)
- OW25 (screened from 1.98 to 4.72 mbgs)
- MW17-104S (screened from 1.22 to 3.66 mbgs)
- MW18-135S (screened from 4.27 to 5.79 mbgs)

PAHs with an HQ greater than 1 were limited to groundwater collected from 8 wells:

- OW18-I (screened from 1.81 to 4.86 mbgs)
- OW22S (screened from 1.36 to 4.1 mbgs)
- OW23S (screened from 2.52 to 5.26 mbgs)
- OW25 (screened from 1.98 to 4.72 mbgs)
- MW17-104S (screened from 1.22 to 3.66 mbgs)
- MW17-104D (screened from 6.1 to 7.62 mbgs)
- MW17-109S (screened from 1.79 to 4.32 mbgs)
- MW18-125S (screened from 4.26 to 1.79 mbgs)

Metals (zinc) with an HQ greater than 1 were collected from 11 wells with screen depths ranging from 1.36 to 8 mbgs.

The screened depths of two of the wells with an HQ greater than 1 for terrestrial plants (OW22S and MW17-104S) is within the MECP assumed rooting zone for terrestrial plants (that is, 1.5 mbgs). The minimum groundwater level of 0.93 mbgs is associated with OW22S; however, the average groundwater level at this location is 1.54 mbgs (based on 24 monitoring events). The minimum and average groundwater levels at MW17-104S are 1.52 mbgs and 1.98 mbgs, respectively (based on 8 monitoring events). Groundwater levels in the remaining wells where parameters with an HQ greater than 1 were identified have ranged from 1.52 to 3.98 (average of 3.04). The maximum fluctuation of the water table at these locations straddles the MECP's assumed rooting zone of plants, but the average depth to the water table is deeper than the MECP's assumed rooting zone depth of 1.5 mbgs. The typical MECP (2011a, 2011c) rooting zone assumption of 1.5 mbgs is considered conservative. Several studies state that the rooting zone is much shallower than 1.5 mbgs, including Perry (1982), who indicates that 99 percent of roots are usually present in the top metre of soil; Roberts et al. (2006), who states that over 90 percent "of total root length is found in the upper metre of soil"; and Jackson et al. (1996), who states "by far the majority of ecosystem root biomass resides in the upper 1 m of soil. The 1 m root zone depth may also be considered conservative, in that the Jackson et al. (1996) study estimates that globally, 75 percent of roots are in the top 0.4 m of soil. Based on this additional information, for this RA, a rooting zone depth of 1 mbgs was used to evaluate the potential for risks to terrestrial plants and is also considered conservative. Since a groundwater level less than 1 mbgs has only been measured in 1 of 67 monitoring wells (screened in the overburden/bedrock contact zone) on 1 occasion over 27 monitoring events (refer to Table G2-1 in Appendix G2), risks to terrestrial plants at the population level from groundwater at the Site are unlikely.

Therefore, based on this review of the groundwater analytical data, and the locations and depths to groundwater impacts producing HQs greater than 1, the groundwater concentrations measured at the RA Property are unlikely to pose a risk to terrestrial plant populations onsite, and RMMs are not required.

[4] HQs were assumed to be greater than one for PHC F3 and PHC F4 where the groundwater concentrations were greater than the Table 6 SCS of 500 µg/L. Wells where this occurred include: OW22S, OW23S, OW23D, and OW25.

This conclusion is supported by visual observations of the existing vegetation, which visually do not appear to be stressed (despite the known environmental conditions at the Site). Likewise, NAPL is unlikely to pose a risk to terrestrial plants, as the minimum (2.36 mbgs) and average (3.31 mbgs) water levels from the three monitoring wells where NAPL has been observed are deeper than the MECP assumed rooting zone for terrestrial plants of 1.5 mbgs. Therefore, NAPL contact with terrestrial plants in these areas is unlikely.

Refer to Section 5.5.3.4 for the qualitative assessment of the groundwater-to-surface-water pathway.

5.5.3 Qualitative Interpretation of Ecological Risks

A qualitative assessment was completed for pathways where data or information was insufficient to complete a semi-quantitative assessment and for the assessment of potential risk to offsite receptors. The following subsections provide the rationale and results of the qualitative assessment.

Section 5.5.4 discusses the development of proposed EPSSs based on the qualitative assessment. In all cases, Jacobs adopted the estimated maximum concentration of each COC as the EPSS; RMMs were proposed where unacceptable risks to ecological receptors were inferred based on the qualitative assessment.

5.5.3.1 Qualitative Assessment of Minor and Secondary Exposure Pathways

As Section 5.3.1 and Table 5-3 discuss, several exposure pathways are considered minor or secondary for ecological receptors that were not evaluated semi-quantitatively:

- Inhalation of volatiles and particulates for soil organisms, birds, and mammals
- Stem and foliar uptake of ambient air for terrestrial plants
- Dermal contact with soil for birds and mammals

For these pathways, the following factors were considered when determining whether a qualitative or semi-quantitative assessment would be completed:

- There is lack of inhalation toxicity for ecological receptors (SABCS 2008).
- Ingestion exposure is generally assumed to be greater than inhalation exposure (SABCS 2008). EPA compared oral versus inhalation risks for select chemicals and found inhalation risks averaged approximately 0.02 percent of the oral risks (EPA 2003).
- Feathers and fur reduce the likelihood of dermal contact with contaminated media (Suter et al. 2000). The dermal contact pathway has been estimated to "contribute less than 1 percent to 11 percent of the total risk compared to oral exposures" (EPA 2005).
- There is a lack of regulatory- and industry-accepted methods to estimate exposure from these pathways.

Therefore, exposure from these pathways is assumed to be negligible compared to the primary pathways that were semi-quantitatively assessed. Recommended RMMs to protect ecological receptors from the primary exposure pathways (via the semi-quantitative assessment in Section 5.5.2) are assumed to also protect ecological receptors (both onsite and offsite) from these secondary exposure pathways.

5.5.3.2 Qualitative Assessment of Reptiles Onsite

As described in Section 5.2.2, the data and the methods needed to estimate exposure and evaluate toxicity for reptiles (and amphibians) are generally not available (Hopkins 2000, MECP 2011b). Potential risks to reptiles onsite were evaluated in the context of risks to other onsite ecological receptors. As shown in Tables 5-8a and 5-8b, HQs greater than 1 were estimated for several COCs. Therefore, it is assumed that

risks are also possible to reptiles residing at the RA Property, if RMMs are not implemented. The RMMs proposed for the protection of onsite plants, soil organisms, birds, and mammals, are assumed to afford some protection to reptiles, if present onsite.

5.5.3.3 Qualiative Assessment of Birds and Mammals Indirect Exposure to Groundwater via Diet (Vegetation)

The results of the semi-quantitative assessment of terrestrial plant uptake of groundwater (Section 5.5.2.2) concluded that risks to terrestrial plants from groundwater (or NAPL) are unlikey. Therefore, indirect risks to birds and mammals from groundwater via the ingestion of onsite vegetation are similarily unlikely.

5.5.3.4 Qualitative Assessment of Groundwater to Surface Water Pathway

Jacobs qualitatively assessed the potential for groundwater COCs at the RA Property to migrate offsite and effect aquatic receptors in the nearest downgradient surface water body (that is, the Eramosa River).

As Section 5.4.2 discusses, the use of the GW3 component values was concluded to be a more accurate and reliable way of evaluating of potential risks to offsite aquatic receptors from RA Property groundwater than the use of the S-GW3 component values. Therefore, risks to offsite aquatic receptors were primarily evaluated by comparing measured groundwater concentrations to the Table 6 GW3 values.

Thirty chemicals in groundwater were retained as COCs, based on the initial screening against the Table 6 SCS (Section 3.3.2; Appendix F1, Table F1-2). The potential for groundwater leaving the RA Property to impact aquatic receptors in the nearest downgradient surface water body (that is, the Eramosa River) was evaluated by first comparing the estimated maximum concentrations of groundwater COCs to the generic Table 6 GW3 component values (MECP 2011b) (Appendix F1, Table F1-5e). The GW3 values are based on aquatic protection values (APVs), combined with an assumed 10 times dilution within the surface water body. Exceedances of the Table 6 GW3 values indicate concentrations of COCs in groundwater could affect the growth, reproduction, or survival (or all three) of populations of pelagic invertebrates, fish, amphibians, aquatic reptiles, and aquatic plants.

As described in Section 5.4.2, the MGRA model cannot be used to derive site-specific GW3 component values for shallow soil properties. Therefore, the generic Table 6 GW3 values were used for the assessment. Based on the comparison to the Table 6 GW3, ten groundwater COCs were identified to potentially pose a risk to aquatic receptors in the downgradient water body (Appendix F1, Table F1-5e). PHC F3 and PHC F4 are typically not considered soluble or mobile in groundwater. While petroleum-related NAPL is present at the RA Property, the NAPL is not considered mobile (per the discussion in Section 3.21); therefore, offsite risks from NAPL (including PHC F3 and F4) are considered unlikely.

The estimated maximum groundwater concentrations were selected to represent the worst-case groundwater concentrations. High molecular weight PAHs are not expected to be very mobile in soil or groundwater; therefore, offsite risks to aquatic receptors are not anticipated from the following COCs:

- Benzo(a)anthracene
- Benzo(a)pyrene
- Benzo(b&j)fluoranthene
- Benzo(k)fluoranthene
- Chrysene
- Pyrene

Concentrations of anthracene, PHC F1, ~~and~~ PHC F2, and zinc greater than the ~~site-specific~~ GW3 values were located in several wells. Additional details for these exceedances are as follows:

- Concentrations of anthracene were greater than the GW3 in two wells (OW22S and OW23S) between 2014 and 2016.
- Concentrations of PHC F1 were greater than the GW3 in two wells (OW22S and OW24D) between 2010 and 2016.
- Concentrations of PHC F2 were greater than the GW3 in five wells (MW17-104S, MW18-135S, OW22S, OW23S, and OW25) between 2010 and 2018.
- Concentrations of zinc were greater than the GW3 in eleven wells (MW18-131S, OW07-32, OW09-I, OW13, OW14, OW18-I, OW18-II, OW19, OW22S, OW24D, and OW24S) between 2007 and 2018.

Therefore, concentrations of these four COCs in groundwater have the potential to pose a risk to aquatic receptors in the downgradient waterbody, since the estimated maximum concentrations are predicted to be greater than the generic Table 6 GW3 value. To mitigate the potential risks to the offsite aquatic receptors, groundwater monitoring for these COCs is recommended as part of the RMP (Section 7). The groundwater monitoring plan also includes monitoring for the presence/absence of NAPL in select monitoring wells where NAPL has historically been observed and at the downgradient property boundary.

5.5.3.5 Qualitative Assessment of the Presence of Residual Nonaqueous Phase Liquid

Over the course of the Phase Two investigation activities, nonaqueous phase liquid (NAPL) was measured in three locations: OW23S, MW17-108S, and MW18-135S. NAPL has been measured at OW23S (screened from 2.52 and 5.26 mbgs) at thicknesses of 0.005 to 0.97 m in 21 monitoring events between 2010 and 2020. At MW17-108S (screened from 1.93 and 4.98 mbgs), NAPL has been measured at thicknesses of 0.002 and 0.18 m in six monitoring events between 2017 and 2020. At MW18-108S (screened from 4.27 to 5.79 mbgs), NAPL has been measured at thicknesses of 0.02 and 0.93 m in five monitoring events between 2019 and 2020. Therefore, additional consideration of potential risks related to NAPL, and the potential need for additional RMMs due to the presence of NAPL, is warranted. The MECP SCS and component values considered in the evaluation of COCs for the RA Property, and the equations applied in the calculations of risk and hazard, are based on the assumption that the petroleum hydrocarbons are distributed between the dissolved, vapour, and sorbed phases (that is, three phases are considered). With NAPL potentially present at the RA Property, nonaqueous-phase hydrocarbon could be present in addition to the dissolved, vapour, and sorbed phases (that is, four phases are present).

Direct contact exposure to NAPL itself is possible. As the depth to groundwater is less than the MECP assumed rooting zone depth of plants (that is, 1.5 mbgs), there is potential for terrestrial plants to encounter NAPL at the water table. However, because the presence of NAPL would be associated with the reported PHC impacts in groundwater, and risks to terrestrial plants from dissolved PHCs in groundwater was concluded to be unlikely (Section 5.5.2.2); risks to terrestrial plants from NAPL floating on the water table is also considered unlikely. Exposure to residual NAPL within the soil column near the water table may still be possible. Groundwater monitoring is required at the property boundary to monitor the potential movement of anthracene and PHC F2 offsite with potential impacts to aquatic receptors in the Eramosa River. Based on this assessment, RMMs are required to protect offsite aquatic receptors from exposure to PAHs and PHCs in soil with or with the presence of NAPL.

The semi-quantitative assessment of risks due to impacts in soil and groundwater (refer to Section 5.5.2) has already indicated unacceptable risks are likely present for the following pathways:

- Direct contact with soil for plants, soil organisms, birds, and mammals

- Food chain for birds and mammals
- Terrestrial plant uptake from soil

Based on this assessment, RMMs are required to protect plants and soil organisms from exposure to impacts in soil with or without the presence of NAPL.

5.5.3.6 Qualitative Assessment of Contaminants of Concern without Toxicity Reference Values

A EcoBMC protective of birds and mammals for bismuth were not available. Therefore, the risks from this COC to birds and mammals are unknown. As RMMs are recommended to protect these receptors from the existing RA Property soil, the proposed EPSS will be based on the estimated maximum concentration of this COC.

5.5.4 Ecological Property-specific Standards

Based on the results of the risk characterization and following MECP guidance, EPSSs must be proposed for the RA Property; where risk is present, they must consider RMMs. The recommended RMMs, once implemented, will afford ecological receptors the same level of protection as intended by the MECP's generic SCS (MECP 2011c).

The estimated maximum concentration (defined as the maximum observed concentration plus 20 percent [of detected values]) for each COC was selected to be representative of a reasonable upper-estimate of soil and groundwater concentrations remaining on the RA Property. If the observed maximum concentration of a COC was based on an MDL, the observed maximum was selected as the estimated maximum concentration.

Proposed PSSs for soil and groundwater applicable to ecological health were selected as described in the following subsections.

5.5.4.1 Soil

Table 5-10 presents the EPSSs for soil analytes identified as COCs for the RA Property. The EPSSs for soil were selected based on the following factors:

- The estimated maximum concentration, if no unacceptable risks were predicted in the semi-quantitative or qualitative assessments
- The estimated maximum concentration, if unacceptable risks were predicted in the semi-quantitative or qualitative assessments, and exposure pathways with risk exceeding ecological EcoBMCs (that is, HQ values were greater than 1; Tables 5-8a and 5-8b) are mitigated using RMMs (Section 7).

5.5.4.2 Groundwater

Based on the results of the semi-quantitative and qualitative assessments, the EPSSs for groundwater are based on the estimated maximum concentrations. Table 5-11 presents the EPSSs for groundwater analytes identified as COCs for the RA Property. Risk management was determined to be required for parameters with estimated maximum concentrations that exceeded their respective EcoBMCs (that is, HQ values were greater than 1 [Table 5-9 for the Site; Table F-6b for downgradient waterbodies]) and where additional considerations (for example, one or more of location-specific groundwater depth or mobility) indicated that a risk was possible.

5.5.5 Special Considerations

The special conditions for environmentally sensitive areas, shallow soil properties, and water bodies cited under Sections 41 and 41.3 of O. Reg. 153/04 apply to the RA Property. Specifically, due to shallow bedrock conditions on a portion of the property, the RA Property is considered a shallow soil property per Section 43.1. This condition was considered in the initial screening of COCs to be assessed in the RA (refer to Section 3.3). Section 41 (for environmentally sensitive areas) and Section 43.1 (specifically with respect to water bodies) do not apply to the RA Property. The proposed PSSs for ecological health have accounted for the conditions cited under Section 41of O. Reg. 153/04 because they are represented by MECP-supported standards and criteria for sites in this setting, and been given special consideration. RMMs will also be implemented at the RA Property to block or monitor the exposure of ecological receptors to contaminated soil and groundwater.

5.5.6 Interpretation of Off-Site Ecological Risks

The proposed EPSS for soil COCs (presented in Table 5-10) are not anticipated to result in concentrations exceeding the applicable generic MECP standards (inferred to be the Table 6 SCS) at the nearest offsite property. Soil has the potential to migrate offsite via dust originating from soils at the RA Property; however, this mechanism is unlikely to result in a material change to offsite soil concentrations. Vapour and soil inhalation and stem and foliar uptake of ambient air are considered minor pathways for onsite receptors (Section 5.5.3.1) and therefore, are considered negligible for offsite receptors.

The proposed EPSS for groundwater COCs (presented in Table 5-11) could result in concentrations exceeding the applicable generic MECP standards (inferred to be the Table 6 SCS) at the nearest offsite property if groundwater containing COCs at EPSS concentrations greater than the Table 6 SCS migrates offsite (Table 5-12). Groundwater flow appears to flow south, and is influenced by groundwater pumping from municipal water supply wells as well as rivers including the Eramosa River and Speed River.

Offsite terrestrial plants at properties located hydraulically downgradient of the RA property are not expected be affected, despite the fact that the minimum depth to groundwater on the RA Property is 0.93 mbgs (OW22S). This is because the depth to groundwater at wells downgradient of OW22S and closer to the southern Site boundary is greater than 2 mbgs. The average depth to groundwater across the RA Property is greater than 2 mbgs, and therefore deeper than the rooting zone assumed by the MECP (that is, 1.5 mbgs).

Potential effects to aquatic receptors from groundwater discharging from the RA Property to downgradient waterbodies are possible from anthracene, PHC F1, ~~and~~ PHC F2, and zinc.

5.5.7 Discussion of Uncertainty

Uncertainty is an inherent component in any RA. The nature and magnitude of uncertainties depend on the amount and quality of data available, the degree of knowledge concerning site conditions, and the assumptions made to perform the assessment.

This ERA assumed the MECP Table 6 SCS, and other criteria used in the assessment, are set at limits such that adverse effects to ecological receptors and VECs are not expected for concentrations of chemicals at or less than these values. Benchmarks are typically set at very conservative levels; that being the case, they can overestimate ecological risks at a site. Therefore, this area of uncertainty is not expected to affect the conclusions of the ERA.

As is typical for most site investigations and RAs, it is possible that greater or lesser concentrations of chemicals exist onsite compared to those currently measured. This ERA employed a conservative approach to address the potential for underestimation of risks by using the maximum and estimated maximum concentrations of COCs. No effects on the results or conclusions of the ERA are expected from this type of uncertainty.

Ecological receptors typically only contact surface soils (that is, soil within 1.5 m of the ground surface). This ERA assumed subsurface and surface soils could be mixed during redevelopment and construction activities. In the future, subsurface soil could become surface soil and vice versa, so soil data were not segregated into subsurface and surface categories, but were grouped and screened as a single unit. These assumptions tend to overestimate exposure, but would not be expected to affect the conclusions of the ERA.

There is uncertainty related to the EcoBMCs used in the hazard assessment. Though no EcoBMCs specific to the RA Property or selected ecological receptors exist, the ERA used MECP-supported values, as well as other regulatory guidelines and EcoBMCs that have undergone peer review by credible experts, regulatory bodies, and academia. This type of uncertainty, however, is not expected to affect the conclusions of the ERA.

The toxicological information used represents information currently available from published literature. Over time, as more information from studies and research become available, toxicological information for constituents is updated. As a result, the TRVs the EcoBMCs are based on are also expected to change over time. If TRVs are updated, changed, or added, they could inherently change the magnitude of the risk; however, the overall conclusions of the ERA are not expected to change.

There is uncertainty regarding the level of protection afforded to terrestrial reptiles onsite. The data and the methods needed to estimate exposure and evaluate toxicity are generally not available (Hopkins 2000); therefore, this receptor was not assessed quantitatively. It is likely that, based on the conservativeness of the assessment and potential overestimation of effects, the RMMs proposed (for example, clean fill caps) will afford some protection to reptiles, if present, at the RA Property.

There is uncertainty regarding the level of protection afforded to amphibians and aquatic reptiles offsite in the Eramosa River using the MECP APVs (and therefore, the GW3 values). At least one MECP APV has been derived based on effects to frog tadpoles; therefore, in general, the protection of amphibians has been considered in APV derivation. Amphibians and aquatic reptiles experience similar water-mediated exposure pathways as the other aquatic receptors (that is, pelagic invertebrates, fish, and aquatic plants), and the MECP APVs and GW3 values are protective of these receptors. For this assessment, the evaluation of pelagic invertebrates, fish, and aquatic plants was used as a surrogate for the qualitative assessment of amphibians and reptiles.

An EcoBMC specific to birds and mammals was not identified for bismuth. As such, the ERA does not assess risks from this COC to birds and mammals. However, the lack of an EcoBMC for this COC has little effect on the conclusions of the evaluation. Since an elevated risk has already been determined for this receptor or pathway, the recommendation that RMMs should be implemented is not affected by this uncertainty.

The bioavailability of all COCs in all environmental media was assumed to be 100 percent. The bioavailability of each chemical was assumed to be equivalent to that observed or assumed within the study upon which the EcoBMC was based. These assumptions tend to overestimate exposure and would not be expected to affect the conclusions of the ERA.

The assumption that all exposures related to food and soil ingestion occur on the RA Property is conservative. The home or foraging range of mobile VECs is unlikely to be confined to the RA Property; therefore, these assumptions have likely overestimated VEC exposure.

The possibility of a significant risk to go undetected is limited. The use of conservative estimates of exposure has likely resulted in an overestimation of actual risks present at the RA Property. The RMMs that will be implemented in the RA Property area have been developed with due consideration of the uncertainties in the RA. It is likely that, based on the conservativeness of the assessment and potential overestimation of effects, the RMMs developed will be protective of soil organisms, terrestrial plants, birds, and mammals at the RA Property. For example, risks to terrestrial VECs will be addressed by blocking exposure pathways to contaminated soil.

Overall, the combination of several conservative assumptions in the exposure assessment have likely resulted in an overestimation of exposure and, therefore, risk to VECs in the ERA.

5.5.8 Ecological Fill Cap Target Concentrations

The fundamental approach to preventing contact with contaminated soils is to construct a cap or soil barrier in areas where RMMs are required. The purpose of the barrier is to prevent exposure (for example, through dermal contact, ingestion, and root uptake) of terrestrial VECs to contaminants in soil, leaching of soil to groundwater with subsequent discharge to a surface water body is also considered. Overall Ecological Risk-based Target Concentrations were developed based on the lowest of the selected EcoBMCs used in the ERA (for plants and soil organisms [Table 5-6a], ~~or~~ birds and mammals [Table 5-6b] , or soil leaching [generic S-GW3]) or the higher of the lowest EcoBMC and the Table 6 SCS (so that the selected values are not more stringent than MECP generic standards) (Table 5-13). The Ecological Risk-based Target Concentrations were also used to develop the Fill Cap Target Concentrations (Table 6-3).

6. Conclusions and Recommendations

6.1 Recommended Standards

The recommended Property-specific Standards (PSSs) for 200 Beverley Street, in Guelph, Ontario (the Risk Assessment [RA] Property, or Site) are the more applicable and stringent of the human-health-based standards proposed in Section 4 (Table 4-~~39~~40), and the ecological-based standards proposed in Section 5 (Table 5-10). Choosing the most stringent of these values protects ecological and human receptors that are either currently present or anticipated to be present near the RA Property in the future and after its potential redevelopment. Table 6-1 presents the soil and groundwater PSSs for the Site.

These PSSs are based on a qualitative and quantitative evaluation of risk due to exposure to the contaminants of concern (COCs) present on the RA Property. This evaluation indicated risks exceeding target levels are either anticipated to be present onsite now, or to be present following its redevelopment. The evaluation considered the Site's geological and hydrogeological characteristics, the expected onsite receptors, and chemical properties. Jacobs used site-specific information where possible. The recommended PSSs are based on reasonable upper estimates of the concentrations of the COCs remaining at the Site (defined as the maximum detected value plus 20 percent or the highest detection limit). The PSSs have been qualitatively or quantitatively evaluated considering the requirements for risk management.

Jacobs conducted the RA and developed PSSs for the RA Property using the following assumptions:

- The Site currently consists of vacant land historically used for industrial purposes and will be redeveloped to mixed residential, parkland, and commercial use.
- Groundwater is considered potable.
- The soil texture is considered coarse, as defined by O. Reg. 153/04 (as amended).
- The measured groundwater elevations (water table) taken between March 2010 and February 2020 ranged from 311.48 to 314.56 metres above sea level (masl) (0.93 to 4.97 mbgs). The calculated average depth to groundwater is 2.70 mbgs. It is, therefore, assumed that direct contact with groundwater would be limited to subsurface excavations that intercept the groundwater table.
- Subsurface and surface soils are assumed to mix during redevelopment and construction. In the future, subsurface soil could become surface soil and vice versa, so soil data were not segregated into subsurface and surface categories, but were grouped and screened as a single unit.
- Receptors exposed to groundwater could be exposed to COCs observed in groundwater at any depth or from any of the groundwater units identified at the RA Property. Consequently, all units were treated as one unit, and groundwater data sets were aggregated.
- Human receptors are currently present at the RA Property, and may also exist in the future, assuming the potential future land uses mentioned. Consequently, human receptors could be exposed to COCs, and risks were assessed based on future Site conditions, assuming no risk management measures (RMMs) were in place.
- Ecological receptors are currently present and may also exist in the future at constructed ornamental gardens or unmaintained areas. Risks were assessed assuming no RMMs (that is, no clean fill capping layer).
- Exposure events will involve contact with estimated maximum concentrations of COCs, which are estimated based on the observed maximum plus 20 percent (as applied within the MECP Modified

Generic Risk Assessment [MGRA] Model [MECP, 2016]), or by applying the method detection limit (MDL).

- Noncancer endpoints for the HHRA assume a maximum target hazard quotient (HQ) of 0.2 for all COCs except PHCs and inhalation of trichloroethylene, which assume a maximum target HQ of 0.5.
- Cancer endpoints for the HHRA assume a maximum target incremental lifetime cancer risk (ILCR) of 1 in 1 million (1×10^{-6}).
- Ecological health endpoints assume a maximum target HQ of 1.0.
- PSSs were based on the site characterization of soil and groundwater. The PSSs were developed based on the estimated Site maximums (Table 1-1). The estimated Site maximums were derived by applying the greater of the maximum detected concentration, multiplying it by 1.2, and then rounding it down to two significant digits, as appropriate, or by applying the MDL.

6.2 Special Considerations for Groundwater Standards

The risk of free-phase product formation must be considered when proposing PSSs for the RA Property. If the proposed groundwater PSS is greater than 50 percent of the solubility limit, or the proposed soil PSS is greater than the free-phase threshold, the risk of free-phase product formation must be evaluated and, if required, RMMs or remediation proposed to mitigate the formation of free-phase product.

6.2.1 Site-specific Soil Free-phase Thresholds

The risk of free-phase product formation must be considered when proposing PSSs for the RA Property. Mobile free-phase product formation occurs when the residual saturation limit is reached. The PSSs proposed in Sections 4 and 5 for all COCs at the RA Property are within the MECP's theoretical free-phase product thresholds, apart from the proposed PSS for PHC fraction (F) 2, F3, and F4 (see Table 6-2a).

The Canadian Council of Ministers of the Environment (CCME) (2008) indicates that for most petroleum products and soil types, the residual saturation limit occurs with total PHC concentrations on the order of 20,000 to 30,000 milligrams per kilogram (mg/kg). To protect against the formation of a mobile free product, CCME (2008) has established a limit of 2 percent total PHC in soil (or 20,000 mg/kg), of which not more than 1 percent should be in the sum of F1 to F3 and 1 percent in F4.

Theoretical free-phase product thresholds for PHC fractions are reported for residential/parkland land use under nonpotable water conditions and a coarse-textured soil scenario (MECP, 2011). The free-phase product thresholds for these conditions are as follows:

- 2,700 mg/kg for PHC F2
- 5,800 mg/kg for PHC F3
- 6,900 mg/kg for PHC F4

Site-specific, free-phase product threshold values for PHC F2, F3, and F4 were developed based on the site-specific soil characteristics at the RA Property. The MECP's procedure for calculating the theoretical free-phase product threshold (2011, 2016) was also used to develop this value. Based on characterization of the grain size at the RA Property, the following Johnson and Ettinger (J&E) spreadsheet model (EPA, 2004) defaults for sand soil were used in the calculations:

- Bulk Density: 1.66 grams per cubic centimetre (g/cm^3)
- Total Porosity: 0.375 cubic centimetre per cubic centimetre (cm^3/cm^3)
- Moisture Content: 0.054 cm^3/cm^3

For PHC fractions, a theoretical Site-specific free-phase threshold was calculated for each of the subfractions that contribute to the PHC fraction (see Table 4-5 for subfractions). MECP physical-chemical properties (for example, soil sorption coefficient [K_{oc}], solubility, Henry's Law Constant [H], and molecular weight) for these subfractions were adopted from MECP's Rationale Document (2011) and MGRA model spreadsheet (2016).

The equation used to calculate the Site-specific free-phase threshold is:

$$SSFPT = Sol * (Koc * foc + \frac{\eta_w + \eta_a * H'}{\rho_b}) \quad (1)$$

Where:

SSFPT = Site-specific free-phase threshold (mg/kg)

Sol = Subfraction- (or chemical-) specific solubility (milligrams per litre [mg/L])

K_{oc} = Chemical-specific organic carbon partitioning coefficient (cubic centimetres per gram [cm^3/g])

f_{oc} = MECP generic fraction of organic carbon (unitless)

η_w = Water-filled porosity (cm^3/cm^3)

η_a = Air-filled porosity (cm^3/cm^3)

H' = Unitless Henry's Law Constant

ρ_b = Soil bulk density (grams per cubic centimetre [g/cm^3])

Each of the SSFPTs for subfractions contributes to the PHC fractions (based on the proportions in Table 4-5). The following CCME algorithm was used to determine the final PHC fraction concentration:

$$PHC\ Fraction = \sum \frac{1}{\frac{MF_{sub}}{SSC_{sub}}} \quad (2)$$

Where:

PHC Fraction = Concentration for the specific PHC fraction (for example, F1 through F4) (mg/kg)

MF_{sub} = Mass fraction of each subfraction (Table 4-5) (dimensionless)

SSC_{sub} = Site-specific free-phase threshold concentration (mg/kg) for each subfraction based on the MECP generic f_{oc} value (SSFPT calculated previously)

The MECP also includes 1 percent pore volume in addition to the theoretical calculation presented here. As described in this section, the default J&E spreadsheet model values for sand were used for air-filled porosity, water-filled porosity, and soil bulk density.

The calculated site-specific free-phase threshold concentrations for PHC F2 were confirmed using the MECP's MGRA model (2016).

The following site-specific values were estimated as the theoretical free-phase product threshold:

- PHC F2 = 2,800 mg/kg
- PHC F3 = 5,900 mg/kg
- PHC F4 = 7,000 mg/kg

The estimated maximum concentration of PHCs in soil at the RA Property are:

- PHC F2 = 4,300 mg/kg
- PHC F3 = 27,000 mg/kg
- PHC F4 = 8,700 mg/kg

Considering the site-specific theoretical free-phase product thresholds, Site conditions could lead to free-phase product formation based on the known soil concentration of PHC F2, F3, and F4, and will require either monitoring or management, or both. Therefore, establishing the PSS based on the estimated maximum concentration of this COC at the RA Property may not be appropriate to protect against the formation of mobile free product.

Over the course of the Phase Two investigation activities, nonaqueous phase liquid (NAPL) was measured in three locations OW23S, MW17-108S, and MW18-135S. NAPL has been measured at OW23S (screened from 2.52 and 5.26 metres below ground surface [mbgs]) at thicknesses of 0.005 to 0.97 m in 21 monitoring events between 2010 and 2020. At MW17-108S (screened from 1.93 and 4.98 mbgs), NAPL has been measured at thicknesses of 0.002 and 0.18 m in six monitoring events between 2017 and 2020. At MW18-108S (screened from 4.27 to 5.79 mbgs), NAPL has been measured at thicknesses of 0.02 and 0.93 m in five monitoring events between 2019 and 2020.

Since establishing PSSs based on the estimated maximum concentration of PHC F2, F3, and F4 at the RA Property may not be appropriate to protect against the formation of mobile free-phase product, an action is required for these areas (for example, remediation, treatment, ongoing monitoring, or a combination thereof).

A review of the analytical data for the measured free-phase threshold exceedances indicates that the exceedances are limited to four locations as follows:

COC	Location	Sample Depth (mbgs)	Area
PHC F2	BH07-46	1.22 to 1.68	East, within area previously remediated
PHC F3	BH07-40	0.3 to 1.22; 2.13 to 2.39	East; southeast of previously remediated area
	BH07-67	0.05 to 0.91	West
	BH07-46	1.22 to 1.68	East, within area previously remediated
	MW17-108S	2.74 to 2.9	East, southeast of previously remediated area
PHC F4	BH07-67	0.05 to 0.91	West

The Phase Two ESA (Jacobs, 2020) states that PHC impacts in soil were found in both the upper fill and deeper native silt overburden units, including at the contact with the shallow bedrock surface, a depth at where the groundwater table is present on the east portion of the Site. Light nonaqueous phased liquid (LNAPL) has been found in wells in the area of BH07-40 and MW17-108S, in the eastern portion of the Site. The PHC soil impacts in this area were often found in the deeper native soil, with lesser impacts or no impacts in the upper fill, suggesting that the PHC concentrations were the result of smearing of the LNAPL from the seasonal fluctuations of the water table and not from a separate surficial source. The PHC exceedances in soil may also be acting as a contaminant source mass contributing to the groundwater impacts; however, these impacts are limited to the overburden and bedrock contact zone aquifer unit based on vertical delineation completed (Jacobs, 2020).

Figure 6-1 presents the locations of PHCs exceeding the Site-specific, free-phase product threshold values derived. Because the PSSs for PHC parameters have been based on the estimated maximum concentrations at the RA Property, monitoring will be required in areas such as at the western propery boundary, to ensure mobile free-phase formation does not occur where it has not already been identified at the RA Property. Monitoring of areas with known NAPL is included in Section 7.

PHC Fraction	MECP Free-phase Product Threshold Value[a] (mg/kg)	Estimated Maximum (mg/kg)	Site-specific Free-phase Threshold Value (mg/kg)	Existing Location with Exceedance
F2	2,700	4,300	2,800	Yes
F3	5,800	27,000	5,900	Yes
F4	6,900	8,700	7,000	Yes

[a] Component values from table entitled *Soil Components for Table 2 – Full Depth, Potable Water Scenario (Coarse Textured Soil, Residential/Parkland Land Use)* (MECP, 2011).

6.2.2 Half-solubility Limits

The groundwater PSSs require the potential for free-phase product formation to be considered. The groundwater PSSs proposed in Sections 4 and 5 for all COCs are less than the half-solubility limits as set by the MECP (2011), apart from the proposed PSSs for the following PAHs and PHCs (see Table 6-2b):

- Anthracene
- Benzo(a)anthracene
- Benzo(a)pyrene
- Benzo(b&j)fluoranthene
- Benzo(k)fluoranthene
- Chrysene
- PHC F2
- PHC F3
- PHC F4
- Pyrene

The PSSs for PAHs and PHCs in groundwater have been established at the estimated maximum concentrations. These concentrations are greater than the MECP's theoretical half-solubility limit to protect against the formation of free-phase product; however, the implementation of RMMs (such as groundwater monitoring) can facilitate the management of these concentrations in place. Furthermore, PAHs, PHC F3, and PHC F4 have low aqueous solubility, limited mobility, and are usually associated with soil sediment rather than the dissolved phase; therefore, establishing the PSSs for these parameters at the estimated maximum concentration is considered appropriate for the RA Property.

PHC F2 is a potentially mobile parameter. The following monitoring wells have had groundwater concentrations of PHCs greater than the MECP half-solubility limit:

Location	COC	Screened Interval (mbgs)	Area	NAPL Observed?
MW17-104S	PHC F2, PHC F3	1.22 to 3.66	East	No
MW18-135S	PHC F2	4.27 to 5.79	East	**Yes**
OW09-I	PHC F3	1.79 to 4.84	Southeast	No
OW18-II	PHC F2, PHC F3	6.32 to 7.84	East	No
OW19	PHC F3	1.77 to 4.82	Northeast	No

OW22S	PHC F2, PHC F3, PHC F4	1.36 to 4.1	East	No
OW23S	PHC F2, PHC F3, PHC F4	2.52 to 5.26	East	**Yes**
OW23D	PHC F3	6.55 to 7.77	East	No
OW25	PHC F2, PHC F3	1.98 to 4.72	South-Central	No

As discussed in Section 6.2.1, three locations with the eastern portion of the RA Property (OW23S, MW17-108S, and MW18-135S) have had measurable NAPL during Phase Two ESA investigations.

Considering the site-specific theoretical free-phase product thresholds, Site conditions could lead to free-phase product formation based on the known soil concentrations of PHCs, and will require either monitoring, management, or both. Figure 6-2 shows the existing sample locations that have groundwater concentrations exceeding MECP theoretical half solubility limits for the most mobile PHCs (that is, PHC F2).

6.3 Other Considerations

6.3.1 Nonaqueous Phase Liquid

The potential exists for NAPL to be currently present onsite as residual or mobile NAPL. Typically, NAPL is evaluated in terms of NAPL saturation in soil as a percentage of NAPL that occupies a pore space. The total NAPL saturation in soil comprises residual and mobile NAPL. Residual NAPL is unable to move because the capillary pressures inside pore spaces hold the NAPL in place. Monitoring wells installed adjacent to residual saturation will not accumulate measurable NAPL thickness. Mobile NAPL is any saturation in excess of residual saturation that can move if sufficient hydraulic gradient is present (for example, regional groundwater gradient). The presence of mobile NAPL is typically indicated by the presence of measurable NAPL thickness (not sheens) in monitoring wells or through more complex laboratory testing of undisturbed soil cores.

As discussed in Section 3.21 and 6.2.1, measurable NAPL has been observed during Phase Two ESA investigation in three monitoring wells. The source of the NAPL is likely related to the historical contamination in the northeastern area of the Site which was remediated (soils excavated to bedrock) in 1998. The remaining NAPL on the Site is to the south of the historical excavation, and situated at or below the bedrock contact. Remediation of the NAPL would be technically impractical based on the following rationale:

- The NAPL was found at depths of at least 4.6 mbgs within the fractures of the bedrock.
- The NAPL contains a significant amount of long chain hydrocarbons, such as PHC F3 and F4, which would make recovery challenging.

The data available from the Phase Two ESA and previous investigations suggest the NAPL is contained within the eastern portion of the Site, and migration has been limited given the source or release of contaminants would have occurred over 20 years ago, and the NAPL has been measured in the same area of the Site since at least 2004.

The PSS established in the RA are specific to soil and groundwater. These PSS are not comparable to concentrations that may be present within residual or mobile NAPL. Per MECP (2011), collected soil and groundwater samples should be inspected for multiphase conditions before analysis, to support decision making regarding sample treatment and processing. If NAPL is observed, the need for, and type of analysis required for, those samples should be assessed in the context of what information may be needed to support decision making regarding NAPL RMMs. If NAPL is not observed, the analysis of the soil and

groundwater samples can proceed for comparison of concentrations to PSS, as needed. Section 7 discusses the RMM requirements for the RA Property.

6.4 Special Considerations for Fill Caps

The fundamental approach to preventing contact with contaminated soils is to construct a cap or soil barrier where RMMs are required. The cap or barrier must prevent human and ecological exposure to COCs and prevent the mobilization of the contaminants.

The cap target concentrations consider risk-based concentrations (RBCs) and MECP standards. The RBCs for fill caps were developed based on a mixed residential, parkland, and commercial land use scenario. RBCs were based on residents, as the toddler is expected to be the most sensitive receptor. The following RBCs for fill caps were based on the following:

- Fill cap RBCs considered dermal and ingestion exposure to soil by Residents (Human Health Residential RBC), inhalation in a generic building (for a residential use), and direct ecological receptor contact with soil or soil leaching to groundwater with subsequent discharge to a water body (Ecological RBC) for a future residential land use. As documented in Appendix A3, the Fill Cap Target Concentrations are also protective of worker inhalation in a trench.
- The resulting risk for the fill caps will be less than or equal to the target risk of an ILCR of 1 in 1 million ($1x10^{-6}$), an HQ of 0.2/0.5[1] (human health), and an HQ of 1 (ecological health).

For parameters with RBCs less than the Table 6 Standard, the fill cap target concentration is set at the Table 6 Standard.

Tables 6-3 presents the RBCs for both human health and ecological receptors for mixed residential and commercial use, and also provides the final Fill Cap Target Concentrations for the Site. The cap concentrations are set based on the lowest of the calculated RBCs (human and ecological), and the observed maximum, unless this value is less than the Table 6 SCS, in which case the Table 6 SCS is applied. The fill cap targets apply to all areas of the RA Property and are protective of offsite adjacent buildings that do not have VI RMMs in place. These fill cap targets apply to soil with a soil pH between 5 and 9 and a soil fraction of organic carbon (f_{oc}) of 0.005 (the MECP's default) or greater.

The development of the fill cap targets does not account for potential gardening in fill caps to produce edible fruits and vegetables or potential odours from cap soil. The risks related to the consumption of garden produce are mitigated through the implementation of RMMs that limit or prohibit gardens that produce fruits and vegetables for consumption, or by requiring that home gardens only be grown in aboveground containers or containerized plots. The potential for soil odour issues within the cap are mitigated through the implementation of RMMs that require that soil used in fill caps must meet the Fill Cap Target Concentrations for the Site and also pass a visual and olfactory inspection (that is, no sheen, staining, odour, or mixed debris). With these RMMs in place the Fill Cap Target Concentrations will afford the same protection to Site users at the surface.

7. Risk Management Plan

The objective of this risk management plan (RMP) is to eliminate or minimize human and ecological health risks estimated in the risk assessment (RA), by interrupting or blocking pathways of exposure. This section identifies the conceptual risk management measures (RMMs) intended to reduce the risks from exposure to that contaminants of concern (COCs) in soil and groundwater to acceptable levels.

As this RA has stated, the intended future land use of 200 Beverley Street, Guelph, Ontario (the RA Property or Site) is mixed residential, parkland, and commercial use. The Site currently consists of vacant land historically used for industrial purposes. All onsite buildings have been razed, with concrete floor slabs still in place.

This RMP has been organized as required by Schedule C, Table 1 of Ontario Regulation (O. Reg.) 153/04 (MECP, 2011a) as follows:

- Section 7.1, Risk Management Performance Objectives
- Section 7.2, Risk Management Measures
- Section 7.3, Duration of Risk Management Measures
- Section 7.4, Requirements for Monitoring and Maintenance
- Section 7.5, Financial Assurance
- Section 7.6, References

7.1 Risk Management Performance Objectives

RMMs are needed for the pathways identified by the RA to pose potential risks to human and ecological receptors. The purpose of the RMMs is to reduce receptors' potential risk to acceptable target levels (that is, for human receptors, the incremental lifetime cancer risk [ILCR] is reduced to less than or equal to 1×10^{-6}, and the human health hazard quotient [HQ] is reduced to less than or equal to 0.2 [or less than or equal to 0.5 for petroleum hydrocarbons {PHCs} and trichloroethylene {TCE} for inhalation only]; and for ecological receptors, the HQ is reduced to less than or equal to 1).

Based on the RA, the predicted risk may exceed the Ontario Ministry of the Environment, Conservation and Parks' (MECP's) target levels for the following receptors:

- Residents and Site Visitors (all ages)
- Indoor Workers
- Outdoor Workers
- Construction and Utility Workers
- Offsite Surface Receptors (Residents, Visitors, Patrons) and Offsite Construction and Utility Workers
- Ecological Receptors (soil invertebrates, terrestrial plants, birds and mammals, and offsite aquatic receptors)

The potential for unacceptable risk at the RA Property, as Table 7-1 indicates, can be placed in one of the following broad categories:

1) Exposure to indoor air through inhalation (human – Residents, Indoor Workers, and Site Visitors only)
2) Exposure to soil, either through ingestion (human and ecological), dermal contact (human and ecological), or dust inhalation (human)
3) Exposure to groundwater, through incidental ingestion and dermal contact (human – Construction and Utility Workers only, and ecological)

4) Exposure to nonaqueous phase liquid (NAPL) through direct contact (human and ecological)
5) Exposure to outdoor air in a trench (human – Construction and Utility Workers only)
6) Exposure to groundwater, through ingestion and dermal contact with drinking water (human – Residents and Site Visitors)

The following performance objectives have been established for the RMMs to address the risks associated with these pathways and receptors:

1) Block inhalation exposure for human receptors of volatile COCs in soil and groundwater migrating into enclosed structures built on the RA Property.
2) Block direct contact (dermal or ingestion) of COCs in soil for both human and ecological receptors.
3) Block inhalation exposure of COCs on dust particles for human receptors.
4) Block direct contact (dermal or ingestion) of COCs in groundwater for human receptors in excavations or trenches
5) Block direct contact for human and ecological receptors from NAPL.
6) Block or reduce inhalation exposure for human receptors of volatile COCs in soil and groundwater migrating into trenches or excavations on the RA Property.
7) Restrict direct contact (dermal or ingestion) of COCs in groundwater for human receptors (via the potable pathway)
8) Monitor groundwater leaving the Site at downgradient property boundary (for potable, inhalation, and aquatic pathways for off-site receptors)

These objectives will be achieved by implementing RMMs, including caps to prevent contact with soil where existing soil does not meet the Fill Cap Target Concentrations, vapour intrusion (VI) mitigation systems, and administrative controls.

The required percentage reduction in COC concentrations, based on the RA calculations are presented in the following tables:

- VI Mitigation Systems (soil to indoor air): Table 7-2a
- VI Mitigation Systems (groundwater to indoor air): Table 7-2b
- Fill Cap Barrier: Table 7-2c
- Soil Direct Contact (Subsurface Workers): Table 7-2d
- Groundwater Direct Contact: Table 7-2e
- Trench Air Monitoring (Outdoor Air): Table 7-2f

It is expected that these RMMs will effectively block or mitigate each of the exposure pathways to reduce potential risk to acceptable levels. Capping is expected to result in 100 percent risk reduction, while vapour mitigation is expected to reduce risk by between 95 and 100 percent.

7.2 Risk Management Measures

This section outlines the following specific RMMs recommended to meet the risk management performance objectives. The proposed RMMs include:

- VI mitigation systems for newly designed and constructed enclosed structures (to mitigate exposure to volatile soil and groundwater COCs via the indoor air inhalation pathway) (Section 7.2.1). In addition, restriction of subgrade occupied structures in select areas of the Site, where NAPL has been

observed, is included as an administrative control to mitigate exposure to volatile COCs sourced from NAPL in indoor air (Section 7.2.3).

- Capping (fill caps, hard caps, or both to prevent direct contact with soil COCs by human and ecological receptors) (Section 7.2.2)
- Administrative controls, including requirements for health and safety plans (HSPs), soil and groundwater management plans (SGMPs), restrictions on the installation of potable or commercial wells at the Site to mitigate exposure to soil and groundwater COCs and exposure to potential NAPL (Section 7.2.3).

The following activities are also required to confirm the RMMs are properly installed and applied, and the efficacy of the RMMs is maintained:

- Monitoring of subslab vapours (and indoor air, if required)
- Inspecting and maintaining cap and VI mitigation systems
- Recordkeeping and reporting
- Contingency planning

In addition, while not intended for risk reduction, groundwater monitoring is also proposed to evaluate the risk to off-site receptors, including the potable water supply from any off-site migration of groundwater impacts.

Section 7.4 further describes these additional activities.

7.2.1 Vapour Intrusion

The results of the VI modelling (Section 4) using estimated maximum soil and groundwater concentrations predicted indoor air inhalation risks at levels exceeding the MECP acceptable target levels for a generic residential building (that is, 1,225-cm-by-1,225-cm building with an enclosed-space height of 366 cm) and generic commercial building (that is, 2,000-cm-by-1,500-cm buildings with an enclosed-space height of 300 cm).

No design plans currently exist for future buildings at the Site. Additionally, it is currently unknown where on the Site future buildings may be constructed; these buildings may or may not be located in the areas where elevated volatile organic compound (VOC) concentrations or NAPL may be observed in soil or groundwater. Until data are available that demonstrates (1) that the indoor air exposure pathway is not complete for a building planned for construction or (2) that the pathway does not present an unacceptable risk, VI RMMs are required for all future buildings.

During the planning phase for new enclosed structures on the RA Property, and prior to the initiation of construction, soil vapour surveys may be completed in the area where the building(s) are to be placed. The soil vapour surveys must be completed under the direction and oversight of a qualified person (QP), must consider the area within 30 metres (m) of the proposed footprint of the building and consider potential seasonal variations. If these construction-specific VI assessment activities for new construction conclude impacts to indoor air exceeding the health-based targets are not expected, application may be made to the MECP to modify the required vapour mitigation for the proposed construction work. In that case, additional reporting to the MECP Director will be required. The construction specific VI assessment report, signed by the QP, will be submitted to the MECP Director for review and approval before the building design(s) are finalized, construction is initiated, and the CPU requirements are modified by the MECP, for some or all of the RA property.

The general VI design and implementation process illustrated on Figure 7-1 can be applied to support the development of VI mitigation measures. The vapour mitigation system will be designed by an appropriately qualified licensed Professional Engineer (P.Eng.) in consultation with a Qualified Person (QP) in accordance with an applicable conceptual design, as determined by the building type and location. If pre-construction soil vapour assessments are completed to focus and refine VI mitigation approaches, application can be made to the MECP Director to use alternate approaches in consultation with a QP and as directed by a qualified P.Eng. Table 7-3 presents the VI RMMs recommended for various possible future building constructions on the RA property.

Key elements of the conceptual designs for VI RMMs must include:

- Vapour-proof barriers
- Passive subslab or submembrane venting systems, including suction pits (or plenum boxes)

These may be further refined through a pre-construction survey and combined with any of the following:

- Vapour cut-off trench
- Foundation and penetration sealing
- Building design (for example, parking garage at ground level) with mechanical ventilation
- Building restrictions in certain areas of the Site (for example, no enclosed buildings in select areas of the RA Property)

Appendix I provides an engineering report prepared in accordance with O. Reg. 153/04 (MECP, 2011a), Schedule C, 4(6)7, that gives additional details and typical drawings for vapour mitigation measures. Vapour barrier, suction pit, subslab venting, submembrane venting, and/or vapour cut-off trench as-built drawings signed by a P.Eng., as well as documentation outlining the testing and performance requirement for each installed VI mitigation system, must be produced for each building constructed with a VI mitigation system. This documentation should outline the testing and performance results (the quality assurance [QA] and quality control [QC] processes applied and the results of these assessments) during installation.

Passive subslab venting systems may run through the footprint of the building, or be strategically placed only under certain portions of the building, based on the results of a building specific VI assessment. The total number of venting pipes would be determined by the extent of the impacts and area of influence modelling. Suction pits may be used instead of venting pipes and be strategically placed as needed within the portions of the buildings where subslab vapours are identified as an issue.

Vapour cut-off trenches can be employed where construction-specific VI assessment activities indicate vapours are migrating towards the building from beyond the building footprint. Vapour cut-off trenches are strategically placed exterior to the building, to prevent movement of vapour into the building.

If a passive venting system is inadequate, then contingency activities can include converting the passive venting system to an active depressurization system. Section 7.4.1 describes scenarios where the implementation of such contingency measures is warranted.

Additional mitigation measures that are typically employed through a MECP Tier 2 RA process may also be considered in tandem with passive measures, such as no first storey residential use and may be appropriate in select areas of the RA Property and would need to be supported by pre-construction VI assessment to determine the applicability of these measures and application to the Director would have to be made under the CPU. If pre-construction VI assessment indicates that soil vapour concentration exceed the screening concentration then an alternate approach may be to restrict occupied buildings in select areas in order to avoid significant VI mitigation requirements.

7.2.2 Fill Caps and Hard Caps

The fundamental approach to preventing contact with contaminated soils is to construct a physical barrier (either a fill or hard cap) in areas where impacted soil is being managed in place. This barrier will also prevent the movement of impacted soil, and will thus inhibit opportunities for soil COCs to impact offsite receptors, including dust migration. Upon redevelopment of the RA Property, a physical barrier (either a fill or hard cap) is required across the entire Site. The suitability of fill caps versus hard caps and their required minimum thicknesses depend on the planned use and management of the area. In areas where ~~there are potential risks to terrestrial plants, soil invertebrates, birds, and mammals, and~~ the land use requires unconsolidated material for vegetation growth, a fill cap can be used as the RMM. Fill caps are generally thicker than hard caps because they are prone to penetration by digging animals, and from erosion and desiccation. Fill caps can be constructed or established from unimpacted material over impacted soils.

Unimpacted fill is defined as soil that meets the Fill Cap Target Concentrations (FCTC) (Table 7-2c) developed as part of this RA (for soil located on the RA Property) or the applicable generic standard (for soil imported to the RA Property) and passes visual and olfactory inspection (that is, no sheen, staining, odour, or mixed debris). Unimpacted fill may also include other inert material, virgin granular material, and products.

FCTCs have been developed as part of this RA to support the reuse of soil located on the RA Property for the following scenario:

- The development of the FCTC includes consideration of future human residential and visitor users and ecological receptors that may access these materials.
- The derivation of FCTC considers indoor air exposure, and hence FCTC are applicable to the reuse of soil in areas within 30 m of an enclosed building without VI RMMs (such as buildings immediately offsite).

For parameters for which the calculated risk-based concentrations are less than the *Table 6: Generic Site Condition Standards for Shallow Soils in a Potable Groundwater Condition* (Residential/ Parkland/Institutional Property Use) (Table 6 SCS) (MECP, 2011c), the FCTC are set at the Table 6 SCS.

The application of the FCTCs are specific to reuse of soils from the RA Property. See Appendix I for further details. Soil located off the RA Property and considered for importation to the RA Property as unimpacted fill must meet the Table 6 SCS and the soil must also pass visual and olfactory inspection (that is, no sheen, staining, odour, or mixed debris).

Appendix I elaborates on the definition of unimpacted fill and unimpacted fill sources.

Upon redevelopment of the RA property, a physical barrier is required where impacted soil is present at or within 1,000 mm below the soil surface. Both fill and hard caps can be used on the RA Property. Table 7-4 summarizes the required barrier thicknesses. Appendix I includes an engineering report prepared in accordance with O. Reg. 153/04, Schedule C, 4(6)7, that gives additional details and typical drawings for fill and hard caps.

Where there is an existing hard cap that is not going to be reconstructed (for example, existing building slabs or existing asphalt surfaces), this hard cap can remain in place to serve as the barrier provided it is confirmed by a QP to be competent and meets the minimum required thickness for hard caps.

In general, the caps discussed herein are not intended to limit or prevent surface water infiltration to mitigate leaching of contaminants from shallow, unsaturated soils.

Following the implementation of caps, a site plan prepared and signed by a QP will be submitted to the MECP within 3 months of either the completion of RA Property development or of its occupancy, whichever occurs first. The site plan will describe the RA Property, and the placement and quality of the barriers to RA Property soils; and will include a plan and cross-section drawings specifying the lateral extent and thickness of the barriers.

Following the barrier's construction, the use of commercially available topsoil for landscaping and gardening does not require characterization or recordkeeping, per the SGMP (see Section 7.2.3.2).

7.2.3 Administrative Requirements

Exposure to contaminated media will be mitigated by restricting activities and implementing requirements for individuals (such as Construction and Utility Workers) undertaking tasks that may put them into direct contact with contaminated materials, when conducting subgrade work below caps. Table 7-5 summarizes the requirements that represent administrative controls, and presents the timeframe for which the administrative controls apply (for example, current conditions, future conditions, or both).

Until the RA Property is redeveloped, the following interim administrative requirements will apply unless barriers are in place:

- Maintain the current fences surrounding the RA Property to prevent access by unauthorized personnel (that is, trespassers) or large terrestrial receptors (that is, mammals). The existing fences should be inspected semi-annually for deficiencies that may allow unauthorized access portions of the RA Property. Deficiencies should be repaired in a timely fashion. Evidence of entry of unauthorized personal should be recorded. If trespassing is noted to occur frequently, the need for upgrading fencing or security should be evaluated.
- Maintain existing asphalt and landscaped or vegetated areas before the redevelopment of all, or portions of, the RA Property.

The remainder of this section outlines the administrative requirements that apply at the site at all times (that is, now and in the future).

7.2.3.1 Site-specific Worker Health and Safety Plan

A HSP that accounts for the presence of the COCs in soil and groundwater and NAPL at the RA Property and the related potential risks to Construction and Utility Workers (such as inhalation of dust derived from Site soils, direct contact with soil or groundwater, direct contact with NAPL in soil or groundwater, inhalation of vapours generated from volatile soil or groundwater COCs, or inhalation of vapours derived from NAPL), must be prepared by a Competent Person, as defined by the *Occupational Health and Safety* Act (Government of Ontario, 2016), and implemented before excavation activities at the RA Property.

The HSP will be prepared per applicable Ontario Ministry of Labour health and safety regulations, and consider the potential risks identified in the RA. The HSP will include provisions for occupational hygiene requirements, personal protective equipment (PPE), contingency plans, and contact information. Appropriate levels of PPE for normal dermal protection should be used (for example, U.S. Occupational Safety and Health Administration Level D PPE), with an upgrade to a greater level of protection if deemed appropriate by the onsite health and safety officer or coordinator.

The HSP will not address other health and safety Project related requirements that must be addressed by the Constructor.

The HSP requirements as related to this risk assessment are as follow:

- All subsurface work, including future subsurface work that may involve breaching of the caps, activities will require appropriate levels of PPE for normal dermal protection (for example, U.S. Occupational Safety and Health Administration Level D PPE) against contact with soil and groundwater COCs and NAPL, with an upgrade to a greater level of protection if deemed appropriate by the onsite health and safety officer or coordinator. All above-grade work that may involve contact with contaminated soil will also require the use of PPE for dermal protection (that is, gloves).
- For subsurface workers that may perform work in a trench (defined as an excavation that is deeper than it is wide), as per O. Reg. 213/91 for construction projects, all projects shall be adequately ventilated by natural or mechanical means, to be determined by appropriate monitoring.

Before initiating any "project" (as defined in the Ontario *Occupational Health and Safety Act*, as amended [Government of Ontario, 2016]) on the RA Property, the local Ontario Ministry of Labour office is to be notified of the planned activities and informed that the RA Property contains contaminated soil and groundwater, and NAPL. The HSP must be overseen by an appropriately qualified person, who must review the provisions of the HSP for planned site work and must conduct daily inspections. The owner will retain a copy of the plan, which will be available for review by the MECP upon request. Additionally, where required for a "project", an annual report will be prepared to document all records related to the health and safety plan in place during the previous calendar year. The annual report will be prepared on or before March 31 each year, until written approval to discontinue the program is obtained from the MECP. The annual report is to be retained by the owner and submitted to the MECP upon request.

7.2.3.2 Soil and Groundwater Management Plan

Contact with contaminated soil and groundwater, and potentially NAPL at the Site may result in unacceptable risk to Construction and Utility Workers. The implementation and use of a SGMP reduces the risk of contact with potentially contaminated subsurface soils and groundwater and additionally accounts for the potential to encounter NAPL. This plan will be prepared under the oversight of a QPESA before work begins, and will be required for intrusive work potentially exposing onsite soils, groundwater, or NAPL. The SGMP is used during activities that involves contact with subsurface soils under the cap, including excavation, stockpiling and relocation, as well as any importation or reuse of soil.

The SGMP will involve an approach specific to where excavation activities are proposed and based on the background information and data used to derive the PSSs. The plan (according to typical MECP Certificate of Property Use [CPU] requirements) will identify, at a minimum, provisions for soil excavation, stockpiling, tracking, dust management, odour management, characterization, disposal, and recordkeeping, specifically:

- Dust control measures and the prevention of soil tracking by vehicles and personnel from the RA Property, including wetting of soil with potable water, truck tarping, enforcing reduced speeds for vehicles, providing tire washing stations, and restricting work under high-wind conditions (weather monitoring).
- Odour control measures including, weather monitoring (temperature, humidity, wind), monitoring with a photoionization detector, ambient air quality sampling (depending on the extent and duration of the excavation activities), specifications regarding the size of open excavations, wetting of soil with potable water, implementation of atomization equipment or foam suppression, tarping odourous soil, or ceasing work to reassess the source of odour and to evaluate the appropriate control measure.

- Management of excavated materials, including equipment decontamination, placing materials for stockpiling on designated areas lined and covered with polyethylene sheeting, berming and fencing these areas to prevent access, and implementing runoff control to minimize contact.
- Characterization of excavated materials from the RA Property to determine if materials exceed the PSS or FCTCs. Characterization of soil to be reused on-site as soil barrier material will be conduced per Table 2, Schedule E of O. Reg. 153/04, as presented in Table 7-6. As per Section 36 of Schedule E of O. Reg. 153/04, if the stockpile volume is greater than 5,000 cubic metres (m^3), the minimum number of samples that must be collected and analyzed as described in paragraph 5 is the amount determined in accordance with the following formula:

$$N = 32 + (V - 5000) \div 300$$

Where,

N = the minimum number of samples, and

V = the stockpile volume in cubic metres.

- Excavated material meeting the Cap Target Concentrations (Table 7-2c) may be placed within the soil barrier if deemed suitable by a QP. This soil must also pass a visual and olfactory inspection (that is, no sheen, staining, odour, or mixed debris), where relevant.
- Characterization of soil to be reused onsite under cap will be sampled at a frequency of 1 per 500 m^3. Excavated material from the RA Property meeting the PSSs may be placed onsite below the soil barrier, with the exception of PHCs. Soils to be reused onsite under the cap must meet the FPT for PHCs as per Table 6-2a in Section 6. This soil must also pass a visual and olfactory inspection (that is, no sheen, staining, odour, or mixed debris), where relevant. Geotechnical considerations for soil reuse are outside the scope of this assessment.
- Excavated soils requiring offsite disposal as a waste will be disposed of per the provisions of O. Reg. 347 (MECP, 1990a) as amended.
- Excess groundwater collected during construction activities can be disposed of in accordance with O. Reg. 347. The collected groundwater can also be disposed of to the local sewer system, provided the appropriate approval is in place, and the groundwater meets the sewer use bylaw discharge limits. Where necessary, the groundwater can be pumped to a temporary groundwater treatment system and treated prior to discharge.
- Where soil or other material containing visible sheen (residual NAPL) are encountered during construction, appropriate removal and disposal of this material must be conducted as per O. Reg. 347 (MECP, 1990a) as amended and notification must be provided to the Director in writing within 24 hours of the NAPL being encountered and may require one or all of the following measures:
  - If NAPL is encountered, it must be removed before excavation continues, to avoid mixing the NAPL with the excavated material. Removal may include use of a vacuum truck.
  - Material with residual NAPL should be managed to minimize the requirements for stockpiling. If stockpiling is required, an impermeable barrier (for example, tarp or equivalent) must be placed on the ground.
- Recordkeeping will include dates and duration of work; weather and site conditions; stockpile management and drainage; characterization results for all materials; names of the QPs, contractors, and haulers; receiving sites for any materials removed from the RA Property; and any complaint received related to site activities.

A copy of the plan, any amendments to the plan, and the records kept per the plan will be made available for review by the MECP upon request. Additionally, if required, an annual report will be prepared to document the soil and groundwater management plan activities conducted during the previous calendar year. The annual report will be prepared on or before March 31 each year, until written approval to discontinue the program is obtained from the MECP. The annual report is to be retained by the owner and submitted to the MECP upon request.

For parameters for which a FCTC, PSS, or both, have not been developed, soil placed at the RA Property must meet the Table 6 SCS (MECP, 2011c) and the soil must also pass visual and olfactory inspection (that is, no sheen, staining, odour, or mixed debris).

7.2.3.3 Groundwater Control and Management

Groundwater control and management is not required for buildings with foundations that do not intersect the water table. However, if buildings with foundations that intersect the water table are to be constructed, groundwater management may require compliance with *Ontario Building Code* requirements, depending on the design of the building. Often, groundwater is collected by a sump or a weeping tile installed around the perimeter of the foundation.

Collected groundwater can be managed in several ways, including the following:

- It can be pumped to a temporary groundwater treatment system (operated with appropriate approvals), treated, and discharged as per City of Guelph Sewer Use and Stormwater Disposal Bylaws (City of Guelph, 1996).
- It can be pumped directly to the stormwater system without onsite pretreatment, if the water meets the local discharge limits as per local storm sewer-use by-laws and municipality approval through the development application process.

The type of treatment will be determined by the sewer use bylaws, which consider groundwater quality and quantity (that is, contaminant loading). If groundwater is intended to be discharged to the natural environment, a Section 53 approval under the *Ontario Water Resources Act* will be required. Special dispensation may be required from the local municipality, and payments are required for estimated or measured usage.

In addition to managing groundwater that may need to be removed from the Site during excavation, the use of trench plugs or low permeability collars are required to prevent the migration of impacted groundwater or NAPL offsite or along utility corridors. The engineering report in Appendix I includes additional conceptual designs for this measure.Where groundwater containing visible sheen (residual NAPL) is encountered during excavation, appropriate removal and disposal of this material must be conducted as per O. Reg. 347 (MECP, 1990a), as amended, and notification must be provided to the Director in writing within 24 hours of the NAPL being encountered. Groundwater with NAPL may be removed by vacuum truck or collected to separate the NAPL for disposal with the remaining water treated to meet discharge criteria.

7.2.3.4 Land Use Restriction

Construction of the following structure types or features is prohibited:

- Single family freehold dwellings; property must have oversight or management
- Due to the presence of soil impacts at the RA Property and development of FCTCs that have not considered the human exposure pathway to edibles, a restriction will be placed on the property,

preventing the use of green spaces for the planting of garden produce unless in aboveground or containerized plots.

- The landscaping plans for the RA Property must consider the potential for mature tree root systems to on rare occasions, contact the water table at depths less than 1.5 mbgs and limited occasions between 1.5 and 2 mbgs, during wetter periods of the year. Tree selections must consider the potential for this condition and tolerant species must be selected. Measures may be considered to provide additional separation between the surface and water table (for example, additional grading or backfill).

Although freehold single-family use residences have not been identified as a probable future use for the RA Property; use of the RA Property for single detached freehold homes with CPU conditions would be problematic to implement and manage. Therefore, this is considered a land use restriction. Future use of the RA Property must include property management oversight in order to ensure RMMs are maintained and the terms of the CPU are abided by.

7.2.3.5 Building Restrictions Due To Nonaqueous Phase Liquid

Residual NAPL and NAPL may be present on the RA Property and the area potentially affected by residual NAPL or NAPL, requiring additional management and consideration is identified in Figure 7-2. This area is based on the previous detection of NAPL in the wells as indicated with the affected area extending outwards to the next NAPL-free shallow well, or where practical due to close proximity, extended to the property boundary.

Within the area indicated on Figure 7-2, the construction of buildings with basements or occupied below-grade structures will be prohibited until it can be shown that the NAPL has been removed through a remediation program. This program could proceed during RA Property redevelopment (that is; excavation) or prior to development and must be directed by all other conditions of the applicable CPU including a HSP and SGMP.

Further, within the area identified in Figure 7-2 or if NAPL is identified elsewhere on the RA Property during construction, the potential presence of NAPL along with the other COCs that may be present, must be taken into consideration when selecting suitable construction materials for slab-on-grade buildings and below grade unoccupied structures.

To summarize, the following additional restrictions apply to the area as designated on Figure 7-2:

- No subgrade occupied structures are allowed within the area unless it can be shown that NAPL is no longer present through a successful remediation program through application to the Director and accepted by the MECP District Office.
- Materials selected for slab-on-grade buildings, including vapour barriers, and subgrade structures, such as utility conduits, must consider the potential presence of NAPL and the design of utility corridors must limit the potential for NAPL migration along these corridors.

The remediation and further characterization of NAPL extent to support the removal of the administrative restriction must be supervised and certified by a QP, and an application to remove this restriction must be submitted to and accepted by the Director and MECP District Office.

7.2.3.6 Potable and Commercial Well Restrictions and Municipal Water Supply Consideration

It has been assumed in the RA that the pathway to the municipal potable water or domestic contact with the groundwater at the Site is likely to be incomplete based on the Site stratigraphy. This pathway was included and quantitatively assessed in the RA and potential risks to receptors were determined if the groundwater was directly contacted either through ingestion or dermal contact. A municipal by-law restricting the installation of new private wells has not yet been adopted by the City of Guelph but may be in the future. It is proposed that an additional restriction, specific to this property, be put in place as part of

the CPU for the RA property to prevent any use of groundwater from the RA Property as a source of water, either domestic or commercial.

As per the CSM included in Appendix D3, a review of the Permit to Take Water database identified nine Permits to Take Water within one kilometer (km) of the Site, which include an industrial water user north of the Site, remediation wells east of the Site, irrigation use to the south (on the opposite side of the Eramosa River), and dewatering and commercial uses located south-southeast of the Site (MECP, 2020a). A review of Ontario Water Well Records found that although 86 water wells (test holes and observation wells) exist within 250 m of the property, no wells were listed as being for potable use (MECP 2020b).

There are nine municipal groundwater supply wells within 3 km of the RA Property, none of which are immediately downgradient between the RA Property and the Eramosa River (see Section 1.4 of Appendix D3).

The City of Guelph categorizes regions of the City within Wellhead Protection Areas (City of Guelph, 2012). The RA Property is within Wellhead Protection Area B. The Site is not located within an Intake Protection Zone (GRCA, 2017). The proposed PSSs for groundwater are in most cases greater than the Ontario Drinking Water Standards or GW1 (MECP, 2011b) values. In order to address the potential long-term impacts to the municipal drinking water supply, it is proposed that the groundwater monitoring program, which includes wells along the downgradient perimeter of the Site, monitor concentrations of COCs compared to GW1 concentrations. Should these GW1 concentrations be exceeded during the monitoring program, contingency measures may include additional fate and transport assessments to further characterize this pathway. Section 7.4.3 presents the details of the proposed groundwater monitoring program.

7.2.4 Implications of the Risk Management Plan for Offsite Human and Ecological Receptors

Each of the proposed RMMs, in particular, the capping of the RA Property to mitigate dust generation, will further reduce the potential risk to offsite human and ecological receptors as a result of impacted soil at the RA Property. The proposed monitoring program (see Section 7.4.3), although not intended to mitigate exposure to groundwater COCs by off-site receptors, will serve to assess the potential offsite risk, and hence allow for timely implementation of contingency measures, if required, to mitigate the risk.

7.3 Duration of Risk Management Measures

The RMMs will continue until the MECP Director amends or revokes the CPU upon request by the owner.

7.3.1 Duration of Risk Management Measures for Vapour Intrusion

For new building construction, unless data are available that demonstrate the indoor air exposure pathway is not complete, or the pathway does not present an unacceptable risk, a vapour mitigation system will need to be in effect for the life of the structure.

7.3.2 Duration of Risk Management Measures for Caps and Soil Barriers

Barriers over portions of the RA Property where existing soil does not meet the applicable FCTC be maintained for as long as the COCs are present at concentrations exceeding the FCTC.

7.3.3 Duration of Administrative Requirements

The administrative requirements will be maintained as follows:

- Current fencing surrounding the RA Property will be maintained until the Site is redeveloped or capping RMMs are in place.
- The Site-specific HSP for workers exposed to site soils, groundwater, or NAPL will be maintained for as long as the COCs in soil and groundwater are present at concentrations exceeding the generic Table 6 SCS or NAPL is present on the RA Property.
- A SGMP will be required for activities that potentially place workers in contact with site soil or groundwater (including NAPL), such as events where soil or groundwater is exposed through excavation.
- Groundwater control and appropriate management through treatment and municipal approved discharge agreements is required as long as excess groundwater is generated either through short-term (construction) or long-term (foundation drainage) discharge requirements.
- Restriction on the use of the RA Property for single family freehold dwelling will remain in place for as long as the COCs in soil are present at concentrations exceeding the generic Table 6 SCS on the RA Property.
- Vegetable gardens, except in aboveground containers or containerized plots, will be prohibited for as long as the COCs in soil are present at concentrations exceeding the generic Table 6 SCS on the RA Property.
- Consideration of appropriate tree species, to minimize potential impacts to the trees as a result of root contact with contaminants at the water table or below 1.5 mbgs will be required for as long as the COCs in soil or groundwater are present at concentrations exceeding the generic Table 6 SCS on the RA Property.
- Restrictions on subgrade buildings within the area identified in Figure 7-2, will remain in place until it can be shown that NAPL is no longer present and successful application is made to the Director have this restriction removed from the CPU.
- Consideration of material selection for vapour barriers for slab-on-grade buildings and unoccupied subgrade structures within the area identified in Figure 7-2 and designs to limit the potential for NAPL migration along utility corridors will remain in place until it can be shown that NAPL is no longer present and successful application is made to the Director have this restriction removed from the CPU.
- Restriction on private wells for potable or commercial supply wells is required for as long as groundwater concentrations in wells of all-depths exceed the Table 6 SCS. This restriction would only be discontinued if it can be shown that all depths of groundwater, including the depth proposed for water supply at the RA Property can be shown to be less than the generic Table 6 SCS.

7.4 Requirements for Monitoring and Maintenance

7.4.1 Vapour Intrusion Risk Management Measure

Figure 7-1 identifies a process, typically used in brownfield redevelopment, leading to specific VI RMM design and monitoring strategies. In addition to building-specific assessment to support design decisions, the process identifies maintenance, monitoring, and reporting activities to be conducted following construction of the VI RMM both before and during the building occupancy. These later activities monitor that the RMM is operating as designed and that appropriate modifications are made (for example, passive system converted to an active system), as needed, so the performance objectives (Section 7.1) are met.

If pre-construction surveys alter the requirements for location and type of VI RMMs, any proposed monitoring would also need to be revaluated and proposed to be consistent with application for changes

to the CPU formally requested through the MECP Director. In absence of data indicating otherwise, VI monitoring programs for all enclosed spaces will be required, prior to and possibly following, the occupancy of any structures.

7.4.1.1 Subslab Vapour or Indoor Air Monitoring Program

A subslab vapour or indoor air monitoring program will be prepared by an appropriately qualified person (a QPESA, P.Eng., or Certified Industrial Hygienist) for buildings prior to building occupancy and before the initiation of VI RMM monitoring. This monitoring is required to demonstrate the objective of the VI RMM is being met for each structure. Subslab vapour monitoring is generally preferred, as it is less likely for the results to be affected by ambient sources.

To be protective of human health for any persons using or occupying the buildings on the RA Property, the building-specific monitoring program will identify VI RMM sampling locations, as well as the total number of each type of sample to be collected. The VI RMM indoor air, ambient air, and/or subslab vapour samples will be analyzed per U.S. Environmental Protection Agency (EPA) Air Method, Toxic Organics-15 (Method TO 15) (EPA, 1999a), Compendium Method, Toxic Organics-17 (Method TO 17) (EPA, 1999b), or equivalent methods for the relevant COCs. The monitoring program will include specific details regarding all elements of the subslab vapour or indoor air monitoring work, including pre-monitoring inspections and surveys, and the operation of building venting systems before and during sampling, as applicable. The number of samples required is dependent on the square footage of the building. Based on information provided by the State of Oregon Department of Environmental Quality (DEQ) Guidance for Assessing and Remediation Vapour Intrusion in Buildings (Oregon DEQ, 2010), the minimum sampling requirement is one per 150 m^2 for buildings up to 1,000 m^2, and one per 250 m^2 for buildings greater than 1,000 m^2.

Sub-slab or indoor air monitoring will involve assessing the volatile COCs that may pose unacceptable risk levels via indoor air inhalation. These COCs are listed in Tables 7-7 and 7-8 along with their target indoor air and subslab soil vapour indicator levels, respectively. Indoor air target levels were calculated using the toxicity reference values (TRVs) presented in Section 4 using the MECP's Modified Generic Risk Assessment (MGRA) Model Spreadsheet (MECP, 2016). The selected soil vapour indicator levels (Table 7-8) were back-calculated from the Indoor Air Indicator Concentrations as shown in Table 7-7, and MECP (2011b) recommended empirical attenuation factors.

The indoor air or soil vapour monitoring will begin with a Baseline Performance Assessment that will last for 1 year, to be followed by 1 year of confirmation monitoring. Baseline performance monitoring will be conducted on a quarterly basis, with the first event occurring before building occupancy. Confirmation monitoring will be conducted three times per year in spring, summer, and winter (sampling events will be timed so summer and winter events occur during maximum heating and cooling seasons). Following at least 2 years of VI RMM monitoring (that is, 1 year of Baseline Performance Assessment and 1 year of confirmation monitoring), the building owner may consider, with the assistance of an MECP QP for Risk Assessment (QPRA), applying to the MECP Director for discontinuation of monitoring.

If any or all of the following occur, the owner should provide written notice to the MECP Director within 14 calendar days of the receipt of laboratory results or date of occurrence:

- Target analytes in soil vapour or indoor air are detected above the target levels indicated in Tables 7-7 and 7-8 followed by:
  - Resampling of exceedance; if resampling meets criteria then continue sampling program. If resampling does not meet criteria then notify MECP and propose contingency actions which may include, but not be limited to, further evaluation, remediation or conversion of a passive system to active.

- There is a reason to change the program as proposed as part of the Baseline Performance Assessment or confirmation monitoring.

VI RMMs will be considered effective if subslab vapour or indoor air samples collected as part of the RMM compliance monitoring meet the selected indicator levels provided in Table 7-7 and 7-8, unless it can be demonstrated to the MECP that the observed elevated COC levels (for indoor air sampling only) are demonstrated to result from other sources unrelated to soil and groundwater conditions (ambient air or building-related sources). If, during any sampling event, sampling results indicate the VI RMM does not meet the performance, the owner will have an appropriate QP prepare and submit a plan to the MECP Director, providing recommendations for modifying the system or implementing VI RMM contingencies (Section 7.4.1.3). Following the implementation of VI RMM contingencies, VI RMM monitoring must include at least two rounds of indoor air or subslab vapour sampling (summer and winter).

An annual report documenting the results of the building-specific monitoring program will be prepared by a QP on or before March 31 following each year of monitoring, until the owner receives written approval from the Director to discontinue the program. The annual report is to be retained by the owner and submitted to the MECP upon request. The annual report will include:

- Laboratory results and laboratory certificates of analysis
- Field logs, leak testing (as necessary), and documentation of QA/QC
- Discussion and interpretation of the results in comparison to the respective target subslab vapour or indoor air concentrations
- Conclusions and recommendations with respect to the need for additional or continued monitoring as may be warranted

7.4.1.2 Vapour Intrusion Mitigation System Inspection and Maintenance Activities

Necessary inspection and maintenance activities for VI RMMs will be identified by a QPESA or P.Eng, and implemented before occupancy to confirm the continuing integrity of the vapour mitigation system and subslab venting RMMs. The inspection and maintenance activities for VI RMMs will be specific to each system and its associated structure, and will be based on the building-specific mitigation measures. The inspection work will include, at a minimum, annual inspections of all vapour mitigation system and subslab venting RMMs. Any deficiencies noted during the inspections will be promptly repaired.

The VI RMM inspection and maintenance activities should include developing and implementing an inspection checklist that includes, for vapour barriers, inspections of the inside surface of the below-grade exterior walls and floors for potential breaches (for example, foundation cracks, penetrations, and infiltrating groundwater). For buildings containing subslab venting systems (including plenum boxes) and vapour cutoff trenches, inspections of the venting systems, where visually accessible, will be conducted to identify potential breaches. Building or site operations that might compromise or damage a component of the system will be prohibited (for example, penetrating a subslab barrier without appropriately sealing the area, disconnecting piping, or turning off electricity to blowers).

If inspections indicate breaches have occurred, the checklist must include information regarding the maintenance and repair of the VI mitigation system. Information regarding the operations and maintenance of the vapour mitigation system, along with as-built drawings and specifications for the vapour mitigation system incorporated into each building, must be documented and retained by the owner, and reviewed as relevant in the identification of appropriate inspection and maintenance activities. Information regarding the operation of any mechanical equipment (including items such as valves,

blowers, and fans) is to be included in this documentation, if relevant, so the equipment can be maintained in accordance with the manufacturer's instructions.

Recordkeeping for inspections, maintenance, and repair activities will be conducted, and records will be available to the MECP upon request.

The need for VI RMM inspection and maintenance activities should consider the results of the subslab vapour monitoring program. If, following at least 2 years of VI RMM monitoring (that is, 1 year of Baseline Performance Assessment and 1 year of Confirmation Monitoring), the results of the monitoring indicate subslab vapour concentrations are protective of indoor air, the building owner may consider, with the assistance of a QPRA, applying to the MECP Director for a reduction or discontinuation of monitoring, inspection and maintenance activities.

7.4.1.3 Contingency for Vapour Intrusion

A goal of monitoring, inspection, and maintenance for a vapour mitigation system is to evaluate the need for contingencies if a mitigation system fails or is ineffective at mitigating VI as designed. The VI RMM monitoring, inspection, and maintenance planning must provide a method for identifying and addressing the two primary types of failure:

1) System failures as a result of damaged components (including, for example, how parts can be replaced or repaired, and specifications for products to repair new cracks in a slab)
2) Systems ineffective as designed (for example, a passive venting layer and sealed slab or membrane barrier do not fully mitigate VI)

Potential system failures or needs for contingencies must be evaluated on an individual basis and must be specific to the operational conditions over time at each structure. If a component of the system is damaged, contingency repairs or replacement of damaged parts should be implemented as soon as the damage is identified.

If, during any event, monitoring results indicate the VI RMM does not meet the performance objectives, the owner will have an appropriate QP prepare and submit a contingency plan to the MECP Director. This plan must provide recommendations for modifying the system or implementing VI RMM contingencies.

The following contingency options have been identified for the various construction types:

- **New buildings** – Increase the number of passive venting points, or initiate existing subslab/submembrane venting system to an active depressurization system.
- **Parking garages** – Increase supply of outdoor air at a rate not less than 3.9 litres per second (L/s) for each square metre (m^2) of floor area (run ventilation system intermittently or full-time as required).

As discussed, VI RMM monitoring following the implementation of contingencies must include at least two rounds of subslab vapour or indoor air sampling (summer and winter).

These contingency options have been acknowledged in the conceptual design drawings and discussions provided in Appendix I, so they can be considered during the initial design and implementation of the primary VI RMMs.

7.4.2 Fill Caps and Hard Caps

Inspection and maintenance activities (as per Table 7-4) will be implemented at the RA Property to promote the continuing integrity of the fill caps and hard caps. At a minimum, there will be semi-annual

inspections (spring and fall). Any deficiencies noted during the barrier inspections will be promptly repaired. The inspection and maintenance activities should include developing and using an inspection checklist with information regarding the construction of the caps, along with as-built drawings and specifications for final cap components. The checklist should also include information regarding how to complete the inspections (for example, timing, and items to look for and document). The cap is to be free of cracks or visible deterioration such that subsurface soils are visible. The checklist should also include information regarding the maintenance and repair of the caps, should inspections reveal cracks, erosion, distressed vegetation, or other indicators the caps may have been compromised. Compromised caps will be repaired immediately, using a suitable seal or repair.

Recordkeeping will take place for inspections, maintenance, and repair activities, and records will be available to the MECP upon request.

Contingency measures for maintaining the fill cap barriers include temporarily fencing off areas where the cap has been severely damaged and making repairs with material compatible and consistent with the original barrier material and with non-destructive repair methods. It is expected that some minor cracking or rutting will occur, but provided the surface material is not entirely compromised, the underlying structural base layer will provide additional isolation from the underlying impacted soils until repairs are required.

7.4.3 Groundwater Monitoring

A period of continued groundwater monitoring is required to identify potential exposures associated with offsite migration of contaminants and the potential impacts on offsite indoor air quality, offsite construction/utility workers, potable water supply or ecological receptors. Monitoring is also required to monitor for the presence of and stability of the onsite NAPL at the RA Property for a period following redevelopment of the RA Property.

7.4.3.1 Groundwater Monitoring Program

The performance objective of the Groundwater Monitoring Program (GMP) is to evaluate the subsurface groundwater regime to determine:

1) Whether there is a substantial change in the chemistry of the groundwater entering or exiting the RA Property
2) Whether NAPL requires management at the RA Property by assessing NAPL stability and mobility
3) Whether indoor air inhalation in offsite buildings is of potential concern for groundwater moving offsite
4) Whether risks to aquatic receptors in downgradient water bodies are possible from groundwater moving offsite
5) Whether risks to offsite workers involved in excavations offsite are a potential concern
6) Whether groundwater concentrations leaving the Site are likely to impact the potable groundwater pathway

Continued monitoring will allow seasonal effects, if present, to be observed within groundwater chemistry and identify concentration trends. As per the CSM for the RA Property, the Site has not been determined to be within the radius of influence of any municipal water supply wells and therefore monitoring for this pathway has been focused on the interpreted downgradient flow path.

Wells have been selected in part based on:

- Groundwater flow direction (that is, the downgradient perimeter of RA property)
- Past or current presence of NAPL
- Suitability of depth of screen to monitor for NAPL at the water table
- Locations situated downgradient of locations with soil or groundwater concentrations above MECP free-phase thresholds (FPT) or half-solubility limits (MECP, 2011b)
- Proximity to downgradient offsite properties

Wells that contain concentrations of COCs that could be attributed to an offsite source (to the west of the RA Property) have been proposed as part of the monitoring program to provide an indication of groundwater concentration from offsite sources that are entering the RA Property. Specifically, wells OW24S/D and OW13-39S/D have been included in the GMP.

The GMP includes the following elements:

- Sampling frequency (seasonal)
- Sampling locations and rationale, including locations for physical inspection for NAPL
- COCs to be assessed, and relevant criteria to which results are to be compared
- Reporting criteria, including frequency
- Well maintenance and inspection
- Waste management plans for investigation-derived wastes
- Triggers for activating contingency action
- Contingency plans

Groundwater from all monitoring wells will be sampled and analyzed according to the *Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act* (MECP, 2011d).

Figure 7-3 presents the proposed groundwater monitoring well locations based on groundwater flow direction and regional hydrogeology. The selection of locations considers the presence of existing wells that could be used for the monitoring program subject to them still being present and in good condition at the start of the Groundwater Monitoring Program. To monitor the stability of the onsite NAPL, existing monitoring wells in the area where NAPL has been observed will be maintained and monitored (specifically, MW18-135S, MW17-108S and OW23S) for presence or absence of NAPL. In addition, wells hydraulically downgradient of the NAPL area will also be monitored to evaluate if the NAPL is advancing (specifically, MW19-137S and OW09-I). If new monitoring wells are required, they should be installed at a similar depth as the above noted wells (that is, straddling the water table where NAPL would be found, if present).

Table 7-9 outlines the proposed locations with the associated rationale. Trigger concentrations (TCs) have been determined based on the well and the pathway that it is intended to address. TCs for each pathway based on either generic component values or onsite RBCs determined in this RA (for select pathways) have been identified and are presented in Table 7-10. The COCs were selected based on the summary provided in Tables 4-40 and 5-12. Those COCs that are not determined to be mobile in groundwater have not been considered further (for example, select PAHs). The recommended TCs have then been categorized as follows:

- PSSs – these apply to all locations at the Site and represent the concentration not to be exceeded at the Site as per O. Reg 153/04. Samples for all locations will be compared to the PSSs.

- TC-A – these apply to the shallow (water table) wells immediately upgradient of the offsite commercial areas and monitor the groundwater to indoor air pathway
- TC-B - these apply to the shallow (water table) wells immediately upgradient of the closest offsite residential areas and monitor the groundwater to indoor air pathway
- TC-C – these apply to all wells in the GMP except the background wells and provide data for the ongoing assessment of potential impacts to downgradient offsite aquatic receptors
- TC-D – these apply to all wells in the GMP except the background wells and provide data for the ongoing assessment of potential impacts to downgradient offsite construction/utility workers
- TC-E – these apply to all wells in the GMP except the background wells and provide data for the ongoing assessment of potential impacts to the municipal potable water supply

All conceptual groundwater monitoring well locations will be monitored for the presence or absence of NAPL (for example, with an interface probe or clear bailer).

The GMP will be initiated within 90 calendar days of the issuance of the CPU for the RA Property. The GMP will include quarterly events in year one and semi-annual events in year two. Following 2 years of groundwater monitoring, the property owner may consider, with the assistance of a QP, applying to the MECP Director to discontinue monitoring.

If any or all of the following occur, the owner should notify the MECP Director within 14 calendar days of the occurrence or receipt of laboratory results:

- There is a reason to change the selected groundwater monitoring wells included as part of the Groundwater Monitoring Program.
- Any measured groundwater concentrations exceed the PSS (Table 6-1).
- Any measured groundwater concentrations exceed the pathway- and location-specific groundwater trigger values (Table 7-10).
- NAPL is observed in a monitoring well that has previously not been identified to contain NAPL.
- NAPL thickness is detected above the trigger value thickness (Table 7-9) in a monitoring well where NAPL has been observed in the past.

In the event of exceedance of the PSS or TCs:

- The owner will retain a QP to evaluate whether the concentrations are increasing in relation to the historical monitoring data trends. If no historical data are available, monitoring will continue per the schedule so results from three events can be assessed for trends.
- Should the evaluation of concentration trends confirm increasing concentrations, the owner will retain a QP to assess the site conditions and determine whether contingency measures need to be implemented (further details regarding contingency measures are presented below). The outcome of the evaluation will be submitted to the MECP Director for consideration.

In the event NAPL is observed in a monitoring well that has previously not been identified to contain NAPL or NAPL thickness is detected above the trigger value thickness (Table 7-9) in a monitoring well where NAPL has been observed:

1) Monitoring will continue per the schedule so results from three events can be assessed.
2) If NAPL is observed over three consecutive monitoring events in a monitoring well where NAPL has not previously been identified or above the trigger value thickness in a monitoring well where NAPL has

been observed, the owner will retain a QP to assess the site conditions and determine whether contingency measures need to be implemented. Further details regarding contingency measures are presented in the following paragraph. The outcome of the evaluation will be submitted to the MECP Director for consideration.

Contingency measures for offsite groundwater movement or NAPL observations may include:

- Further investigation or assessment including modelling or fate and transport assessments
- Removal of NAPL to characterize and assess persistence and volume
- Installation of additional monitoring wells or soil vapour probes
- Completion of a remedial option feasibility study, remedial action plan, or both
- Assessing and implementing remedial technology options to prevent such offsite migration; or
- Some combination of these

The remediation measures, if required, will be designed by a P.Eng. and may include in situ chemical or biological treatment, installation of a passive NAPL collection system, hydrogeological or reactive barrier wall, vapour cut-off trench, or altering groundwater flow patterns using a pump-and-treat system.

An annual report will be prepared to document the activities conducted during the previous calendar year's Groundwater Monitoring Program. The annual report will be prepared on or before March 31 following each year of monitoring, until written approval to discontinue the program is obtained from the MECP. The annual report is to be retained by the owner and submitted to the MECP upon request. The annual report will document the sample results, sample locations, and borehole logs and monitoring well construction information, and will evaluate the temporal trends in groundwater quality and NAPL stability and assess the potential for offsite migration of impacted groundwater.

For robust data collection, accuracy, and security of the hydrostratigraphic units from surface and cross-aquifer contamination, the groundwater monitoring well network should be maintained in good working order. The condition of each well included in the Groundwater Monitoring Program is to be inspected and documented during each sampling event. Only data from wells considered to be in good condition are considered reliable in the context of the Groundwater Monitoring Program. Contingency should be made for the ongoing maintenance of the groundwater well network, so damage and deterioration to the network are fixed in a timely manner. Contingency also should be made to allow the replacement of monitoring wells if wells are found to be in poor condition or damaged by redevelopment activities. Any monitoring wells that are damaged or no longer required as part of the Groundwater Monitoring Program will be appropriately decommissioned. The maintenance, replacement, and decommissioning of monitoring wells will be completed in accordance with O. Reg. 903 (as amended) (MECP, 1990b). Any replacement monitoring well must be screened at the same depth interval as the well it is intended to replace.

Investigation-derived wastes (that is, soil or groundwater) generated as part of implementing the Groundwater Monitoring Program are to be managed as follows:

- Purged groundwater generated from the sampling of the monitoring well will be contained onsite in labelled drums (or other appropriate container) pending the receipt of analytical results. The groundwater will be removed from the RA Property by a MECP-registered waste hauler, if deemed necessary, based on the analytical results.
- Excess soil generated as part of the decommissioning or replacement of any monitoring well will be contained onsite in labelled drums (or other appropriate container) pending the receipt of analytical results, and disposed of per O. Reg. 347.

7.5 Financial Assurance

Financial Assurance (FA) can be required at sites requiring RMMs – particularly sites requiring RMMs that are anticipated to be privately owned. These funds are allotted to support the long-term care and monitoring often required for RMMs. Although the City currently owns the RA Property, there is potential for the RA Property to be sold for redevelopment in the future. Understanding the CPU will be the appropriate regulatory vehicle for FA, it is considered herein to support the development of the CPU, should FA be required.

Section 6.3.3 of Guideline F-15 (MECP, 2005) states:

> *"The amount of Financial Assurance should be based on the expected one-time and recurring costs of each compliance activity specified in relevant regulations or in specific orders or approvals over the intended planning period."*

FA estimates and endorsement of the withheld funds by the MECP need to be established with the landowner under separate cover during CPU development. However, it is expected that the monitoring outlined in this document will form the balance of FA for the RA Property; therefore, this section includes cost items for the RMMs requiring monitoring of media (that is, groundwater and air) as well as a cap and VI barrier inspection and maintenance program.

7.5.1 Vapour Intrusion Monitoring

VI monitoring will need to be completed for each building on the RA Property that includes a VI mitigation system. To identify an estimated cost for FA purposes, several assumptions about the sampling program have been made; however, the final monitoring plan, with the specific number of analytical samples for each structure, will need to be developed in the future based on the actual size, design, layout, and construction of the buildings, and should be prepared by an appropriate QP.

The costs presented in Table 7-11 represent a cost opinion that was developed using the following assumptions:

- The RA Property contains three separate structures (up to 600 m^2 each) that require a passive venting vapour mitigation system.
- The Baseline Performance Assessment for each structure consists of four indoor air or four subslab vapour samples, based on assumed building size (Oregon DEQ, 2010) to be collected during four events during the first year. An ambient (outdoor) air sample will be collected for comparison to subslab vapour and indoor air samples. One duplicate sample will also be collected per event, for a total of six samples per event.
- In Year 2, during Confirmation Monitoring for the structures, three VI sampling events will be conducted during the spring, summer, and winter. Sampling events will be timed so summer and winter events occur during maximum heating and cooling seasons.
- A 20 percent contingency exists for resampling to further assess unexpected results or account for sample container failures.
- Each vapour sample analysis costs $750.
- A consumer price index of 3 percent year-over-year will apply.

Based on the components of the monitoring program outlined, an initial cost estimate is provided in Table 7-11. A 2-year indoor air monitoring FA is estimated at approximately $347,000 for the RA Property.

VI monitoring reports will be prepared annually by an appropriate QP.

7.5.2 Groundwater Monitoring

Based on the components of the monitoring program outlined in Section 7.4.3, an initial cost estimate is provided in Table 7-12. This cost assumes four wells will need to be installed (that is, the proposed existing wells to be included in the GMP will be in place when the GMP is initiated). The 2-year groundwater monitoring FA is estimated to be approximately $225,000.

An annual Groundwater monitoring report with interim letter reports after each event will be prepared by an appropriate QPESA.

7.5.3 Inspection and Maintenance – Cap and Vapour Intrusion Barrier

It is assumed that the monitoring of cap and VI systems will be conducted as part of routine property/building maintenance. Therefore, no additional costs would be incurred as a result of the monitoring requirement.

7.5.4 Financial Assurance Summary

The total FA required for VI monitoring, groundwater monitoring, and cap and VI barrier inspection activities is based upon the number of buildings assumed to require VI mitigation measures within the RA Property, the number of monitoring wells used in groundwater monitoring, and the assumption that repairs to barriers and contingencies activities (for example, additional sampling) are not required. Based on the assumptions documented in Sections 7.5.1, 7.5.2, and 7.5.3, the total FA required for the first 2 years will be approximately $572,000.

8. Public Communication Plan

8.1 Optional Communication Plans

CH2M HILL Canada Limited (CH2M), now Jacobs Engineering Group Inc. (Jacobs), participated in the implementation of an optional Public Communication Plan (PCP) for the planned redevelopment of 200 Beverley Street, Guelph on behalf of the City of Guelph (City). Jacobs's specific role was to consult the public as part of the environmental site assessment (ESA), risk assessment (RA), and redevelopment process. Per Ontario Regulation (O. Reg.) 153/04 (as amended), Schedule C, Table 1, this section provides the following information:

1) *A description of the plan, including any opportunities given to the public to comment on the proposed risk assessment*
2) *A summary of the comments received during the consultation*
3) *A description of how the public comments were considered as part of the risk assessment process.*

8.1.1 Description of Communication Plan

The City includes a PCP as part of brownfield redevelopment activities to proactively involve stakeholders in the project planning process, and to facilitate public participation and communication in an open and transparent forum. The City initiated communication through a public information meeting (PIM) in January 2018, where Jacobs presented items specific to the ESA and RA work (undertaken and planned).

Note, the PCP was not specific to the RA work; public communication regarding the RA Property reviewed the following:

- The planned and completed investigative work
- The potential remedial and management options (for example, risk assessment)
- The scope and schedule of work

The PCP as part of the ESA and RA work was based on the following objectives:

- Conduct open and inclusive activities to engage a broad spectrum of the community in the project.
- Provide sound science and technical information in an accessible and understandable format.
- Focus effort on the project rather than other agendas.
- Provide diversity in opportunities to participate.
- Track and manage issues throughout the project to achieve community support and endorsement of the project.

8.1.1.1 Public Information Meetings

The PIM was held at the Italian Canadian Club, Guelph, Ontario on January 23, 2018. The public was notified about the PIMs using the following methods:

- Notices of PIM on the City's website
- Meeting notices, which were mailed to those on the stakeholder mailing list, as well as area-wide residents

Additional information has been made available electronically for review by the public via the City's website, as well as the developer's website:

- https://guelph.ca/city-hall/planning-and-development/brownfield-redevelopment/200-beverley-street/
- https://arqi.ca/village-200-beverley/

The PIM consisted of the following elements:

- A Microsoft PowerPoint presentation outlining the work done to date, the results to date, and schedule projections
- A question and answer period following the presentation

Approximately 30 to 40 people attended the PIM.

The PIM was focused on the following topics:

- Update on Environmental Process (City/Jacobs)
- ARQi and the Design and Planning Team
- Draft Development Principles
- Roundtable Discussions
- Next Steps and Closing Remarks

Appendix J1 contains a copy of the presentation materials for the PIM.

8.1.2 Summary of Comments Received

Table 8-1 summarizes the comments received at the PIMs, and the responses provided.

8.1.3 Consideration of Public Comments during the Risk Assessment Process

The PIM generally presented all aspects of the ESA investigations conducted to date and the planned ESA and RA work. No specific feedback from the public has influenced the development of the RA for the RA Property.

In February 2021, the City received a request to provide various environmental reports for the RA Property for review and comment. The City provided the documents to the requestor. Comments on the RA were subsequently received by the City in March 2021 and provided to Jacobs for review. Appendix J2 contains the public comments on RA report and Jacobs' response to the comments.

8.2 Required Communication Plans for Risk Assessment Properties in Wider Area of Abatement

The Ontario Ministry of the Environment, Conservation and Parks District Office has not declared the RA Property as part of a "wider area of abatement." Therefore, a PCP for RA Properties in Wider Area of Abatement was not required. Section 8.1 provides details regarding the optional PCP that applies to the RA Property.

[a] COCs were retained for assessment of this pathway when estimated maximum concentrations were greater than the component used to derive the Table 2 SCS (that is, the Table 2 S1 [Direct Contact] component). Appendix F1, Table F1-3 provides the full screening table (including comparison of concentrations to component values).

[b] Volatile COCs were retained for assessment of this pathway when estimated maximum concentrations were greater than the component used to derive the MECP Table 2 SCS (that is, the Table 2 S-IA [Inhalation of Indoor Air] component) and the MECP residential health based indoor air criteria (HBIAC), as shown in Appendix F2, Table F2-2.

[c] The COCs retained for assessment based on comparison to the Table 2 S1 (Direct Contact) component values were retained here for assessment of this pathway. Appendix F1, Table F1-3 provides the full screening table (including comparison of concentrations to component values).

[d] The maximum concentration is the greater of the maximum detected concentration or the maximum detection limit of each parameter.

[e] Estimated maximum concentration is the maximum detected concentration plus 20 percent (according to MECP 2016), or the maximum detection limit.

[f] Parameter retained for ecological assessment; not applicable to human health.

[g] Units for conductivity are mS/cm

Notes:

[a] COCs were retained for assessment of this pathway when estimated maximum concentrations were greater than the component used to derive the Table 2 SCS (that is, GW1 [Direct Contact] component from the table entirled Groundwater Components for Potable Water Scenario). Appendix F1, Table F1-4 provides the full screening table (including comparison of concentrations to component values).

[b] Volatile COCs were retained for assessment of this pathway when estimated maximum concentrations were greater than the MECP Table 2 (potable) GW2 component and the MECP residential health based indoor air criteria (HBIAC), as shown in Appendix F2, Table F2-2.

[c] The maximum concentration is the greater of the maximum detected concentration or maximum detection limit of each parameter.

[d] Estimated maximum concentration is the maximum detected concentration plus 20 percent (according to MECP 2016), or the maximum detection limit.

[e] Theoretical vinyl chloride maximum shown in brackets. Refer to Table 4-7.

× = not retained

✓ = retained

µg/L = microgram per litre

COC = contaminant of concern

F = fraction

MECP = Ontario Ministry of the Environment, Conservation and Parks

Table 4-3. Benzo(a)pyrene Toxicity Equivalence Factors Used in the Risk Assessment

Risk Assessment, 200 Beverley Street, Guelph, Ontario

PAH	TEF [a]
Acenaphthene	0.001
Acenaphthylene	0.01
Anthracene	0.01
Benzo(a)anthracene	0.1
Benzo(a)pyrene	1
Benzo(b)fluoranthene	0.1
Benzo(g,h,i)perylene	0.01
Benzo(k)fluoranthene	0.1
Chrysene	0.01
Dibenzo(ah)anthracene	1
Fluoranthene	0.01
Fluorene	0
Indeno(1,2,3-cd)pyrene	0.1
Methylnaphthalene, 2-(1-)	No TEF [b]
Naphthalene	No TEF [b]
Phenanthrene	0
Pyrene	0.001

[a.] TEF values were obtained from MECP (2011b).

[b.] TEF values have not been derived for naphthalene or 1-,2-methylnaphthalene in the source selected by the MECP (Kalberlah et al, 1995); however, when retained based on the secondary screening process, these chemicals have been assessed as carcinogens for certain pathways as individual COCs. Nisbet and LaGoy (1992) have cited TEF values of 0.001 and 0.1 for naphthalene and 1-,2-methylnaphthalene, respectively. These two TEFs have not been adopted for use in the B[a]PE calculation in this RA for the following reasons:

- The MECP did not select these TEFs for use in Rationale Document (MECP, 2011b) or the proposed Beneficial Reuse Assessment Tool (MECP, 2018).
- These TEFs do not correspond well with the magnitude of the TRVs selected for carcinogenic effects of naphthalene and 1-,2-methylnaphthalene as individual chemicals (that is, individual TRVs indicate greater toxicity than the B[a]P TRV with the TEFs applied for these COCs), and
- Due to the low magnitude of the TEFs, they have a negligible contribution to calculation of the B[a]PE value (that is, the B[a]PE value does not change when these TEFs are considered).

Notes:

Full references provided in Section 4.

B[a]PE = benzo[a]pyrene Equivalent

MECP = Ontario Ministry of the Environment, Conservation and Parks.

PAH = polycyclic aromatic hydrocarbon

TEF = toxicity equivalence factor

TRV = toxicity reference value

Table 4-4. Summary of Maximum Detected PAH Concentrations

Risk Assessment, 200 Beverley Street, Guelph, Ontario

PAH	Maximum Concentration in Soil (µg/g)	Maximum Concentration in Groundwater (µg/L)
1+2-Methylnaphthalene	NA [c]	NA [c]
Acenaphthene	94	21
Acenaphthylene	<2	NA [d]
Anthracene	160	30
Benzo(a)anthracene	200	21
B(a)P	130	2.1
Benzo(b)fluoranthene	190	5.6
Benzo(g,h,i)perylene	70	NA [d]
Benzo(k)fluoranthene	66	<5
Chrysene	180	35
Dibenzo(ah)anthracene	26	NA [d]
Fluoranthene	660	13
Fluorene	150	<50
Indeno(1,2,3-cd)pyrene	80	NA [d]
Naphthalene	NA [c]	NA [c]
Phenanthrene	900	110
Pyrene	470	47
Benzo(a)pyrene Equivalent [a]	235	8.6
Estimated Maximum Benzo(a)pyrene Equivalent [b]	282	10.3

[a.] The calculation of B(a)PE is described in Section 4.1.3.2.

[b.] Estimated maximum concentration is the maximum B(a)PE value plus 20% (according to MECP, 2011c).

[c.] Not applicable. Per Table 4-3, there is no toxicity equivalence factor for this analyte. Therefore, this analyte does not factor into the calculation of B(a)PE.

[d.] Not applicable. Result is non-detect, but the detection limit is not considered representative.

Notes:

Parameters that were nondetect are evaluated using the maximum detection limit.

µg/g = microgram(s) per gram

µg/L = microgram(s) per litre

B(a)P = benzo(a)pyrene

PAH = polycyclic aromatic hydrocarbon

	1 2-trans-Dichloroethylene	µg/L	81		8.1	NA	NA	NA
	VC	µg/L	100	U	NA	990.6	100	**990**

Notes:

[a.] Maximum nondetected or detected concentration, as reported in the analytical data received from the laboratory.

[b.] U: Chemical was not detected.

[c.] Calculated for the parent compounds (tetrachloroethylene; trichloroethylene; 1,1-dichloroethylene; 1,2-cis-dichloroethylene; and 1,2 trans-dichloroethylene). Value is 10% of the maximum concentration (as reported by the laboratory).

[d.] The parent compound (tetrachloroethylene; trichloroethylene; 1,1-dichloroethylene; 1,2 cis-dichloroethylene; and 1,2 trans-dichloroethylene) concentrations were summed, and 10% of the sum was added to the maximum VC concentration (as reported by the laboratory).

[e.] Estimated maximum concentration is the maximum detected concentration plus 20% (according to MECP, 2016a), or the maximum detection limit.

[f.] Final maximum VC concentration used as the input value in modelling and risk calculations. Concentration was selected as the greatest value using either: (1) 10% of the parent compounds' concentrations or (2) the estimated maximum VC maximum concentration rounded to two significant figures.

% = percent
µg/L = microgram per litre
Max = maximum
MECP = Ontario Ministry of the Environment, Conservation and Parks

a. Receptor inputs used only for the assessment of the Composite Resident for carcinogens

b. Receptor inputs used only for the assessment of noncarinogenic developmental COCs (if present).

c. Not applicable. Composite receptor is a sum of the individual receptor ages.

d. Assumed. Rationale Document (MECP 2011) says "Averaging Period for non-cancer is equivalent to exposure duration for each receptor" but does not list all age groups.

e. Value presented to support development of total carcinogenic averaging time of composite receptor by summing of individual age groupings. Carcinogenic risk is not calculated for the individual age groupings.

f. Carcinogenic averaging time is the equivalent of 76 years multiplied by 365 days per year, or the sum of the averaging times of all receptors comprising the composite receptor.

g. Value referenced is for carcinogens only.

h. Exposures for pregnant females are not prorated. That is, exposures are assumed to occur for 24 hours per day, 7 days per week, 52 weeks per year.

i. Values based on minutes per day spent outside by age group taken from EPA's *Child Specific Exposure Factors Handbook* (EPA, 2008).

j. Assumed, but consistent with MECP for Construction Worker scenario.

Notes:

Full references can be found in Section 4.

All values outlined are taken from Rationale for the Development of Soil and Ground Water Standards for Use at Contaminated Sites in Ontario (MECP, 2011) unless otherwise noted.

$Averaging\ Time_C$ = Averaging time for carcinogens

$Averaging\ Time_{NC}$ = Averaging time for noncarcinogens

kg_{BW} = kilogram(s) body weight

MECP = Ontario Ministry of the Environment, Conservation and Parks

mo. = month(s)

NA = not applicable

y = years(s)

a. Receptor inputs used only for the assessment of the Composite Resident for carcinogens

b. Receptor inputs used only for the assessment of noncarinogenic developmental COCs (if present).

c. Not applicable. Composite receptor is a sum of the individual receptor ages.

d. Not applicable. Indoor Worker dermal contact is qualitatively assessed. Outdoor Worker exposure is considered protective of the Indoor Worker.

e. Value represents a time-weighted average of exposed skin surface area, as outlined in the Rationale Document (MECP, 2011).

f. Value represents the sum of head, hands, and forearms, as outlined in the Rationale Document (MECP, 2011).

g. Value represents the average number of showers or bathing events for an adult between the ages 18 and 64 from the EPA Exposure Factors Handbook (2011). In the absence of EPA and MECP values, it is assumed that ages 0 through 17 have the same average of showering and bathing

h. It is assumed that the Construction and Utility Worker are exposed to groundwater one time per day. Limited exposure is assumed to occur during the handling of hoses used to dewater excavations.

i. Value represents the greater of the mean time for showering or bathing, as outlined in the EPA Exposure Factors Handbook (2011). Values were adjusted to match MECP (2011) life stages.

j. It is assumed that the Construction and Utility Worker are exposed to groundwater for 5 minutes per event. Exposure is assumed to occur during the handling of hoses used to dewater excavations.

k. Value represents the sum of all Skin Surface Area, as outlined in the Rationale Document (MECP, 2011).

k. Receptor inputs from the Canadian Exposure Factors Handbook (1997), consistent with the values used to derive the MECP Skin Surface Areas (2011).

Notes:

Full references can be found in Section 4.

All values outlined are taken from Rationale for the Development of Soil and Ground Water Standards for Use at Contaminated Sites in Ontario (MECP, 2011) unless otherwise noted.

cm = centimetre

cm^2 = centimetre squared

event/day = number of events per day

GW = groundwater

hr/event = duration of event

$mg/cm^2/day$ = milligram(s) per centimetre squared per day

mo = month(s)

MECP = Ontario Ministry of the Environment and Climate Change

NA = not available

y = year(s)

Table 4-11. Ingestion Exposure Assumptions

Risk Assessment, 200 Beverley Street, Guelph, Ontario

Parameter	Units	Symbol	Infant Resident [a] (0 - 5 mo.) a. Receptor inputs used only for the assessment of the Composite Resident for carcinogens

b. Receptor inputs used only for the assessment of noncarinogenic developmental COCs (if present).

c. Not applicable. Composite receptor is a sum of the individual receptor ages.

d Not applicable. Indoor Worker incidental ingestion is qualitatively assessed. Outdoor Worker exposure is considered protective of the Indoor Worker for soil and the Resident for drinking water.

e. Refers to incidental ingestion of groundwater while completing site work that extends to the water table. Groundwater is potable.

f. Value obtained from EPA (1989); estimated intake of water while swimming. This value is conservative for construction worker and utility worker incidental ingestion exposure to groundwater.

g Exposures for pregnant females are not prorated. That is, exposures are assumed to occur for 24 hours per day, 7 days per week, 52 weeks per year.

Notes:
Full references can be found in Section 4.
All values outlined are taken from Rationale for the Development of Soil and Ground Water Standards for Use at Contaminated Sites in Ontario (MECP, 2011) unless otherwise noted.
EPA = U.S. Environmental Protection Agency
L/event = litre per event
mg-soil/d = milligram soil per day
mo. = month
MECP = Ontario Ministry of the Environment, Conservation and Parks
NA = not applicable
y = year

Table 4-12. Dust Inhalation Exposure Assumptions
Risk Assessment, 200 Beverley Street, Guelph, Ontario

MECP = Ontario Ministry of the Environment, Conservation and Parks
NA = not applicable
PM_{10} = particulate matter less than 10 µm in diameter
y = year(s)

Table 4-13. Pathway Analysis Summary

Risk Assessment, 200 Beverley Street, Guelph, Ontario

Pathway	Receptor								Rationale
	Construction Worker	Utility Worker	Outdoor Worker	Resident	Site Visitor	Indoor Worker	Offsite Surface Receptors	Offsite Construction/ Utility Worker	
Ingestion Exposure - Soil	**Included**	**Included**	**Included**	**Included**	Qualitative	Qualitative	Excluded	Excluded	Pathway is complete for all onsite receptors. Onsite receptors may come into contact with site soils in the absence of RMMs. Offsite surface receptors and workers will be discussed in the context of the onsite receptors; site visitors will be discussed in the context of residents; and indoor workers will be discussed in the context of outdoor workers.
Dermal Contact Exposure - Soil	**Included**	**Included**	**Included**	**Included**	Qualitative	Qualitative	Excluded	Excluded	Pathway is complete for all onsite receptors. Onsite receptors may come into contact with site soils in the absence of RMMs. Offsite surface receptors and workers will be discussed in the context of the onsite receptors; site visitors will be discussed in the context of residents; and indoor workers will be discussed in the context of outdoor workers.
Ingestion Exposure - Groundwater	**Included**	**Included**	Excluded	Excluded	Excluded	Excluded	Excluded	Qualitative	Pathway is complete for certain receptors. Construction and Utility Workers (both onsite and offsite) may come into contact with groundwater while working in the subsurface. Exposure and risk to offsite receptors will be discussed in the context of the onsite results as onsite concentrations, exposure, or both are expected to be greater. Receptors at the surface (that is, Residents, Outdoor Workers, Indoor Workers, and Site Visitors) are not expected to come into contact with groundwater at the water table.
Dermal Contact Exposure - Groundwater	**Included**	**Included**	Excluded	Excluded	Excluded	Excluded	Excluded	Qualitative	Pathway is complete for certain receptors. Construction and Utility Workers (both onsite and offsite) may come into contact with groundwater while working in the subsurface. Exposure and risk to offsite receptors will be discussed in the context of the onsite results as onsite concentrations, exposure, or both are expected to be greater. Receptors at the surface (that is, Residents, Outdoor Workers, Indoor Workers, and Site Visitors) are not expected to come into contact with groundwater at the water table.
Ingestion Exposure - Groundwater as Potable Water	Excluded	Excluded	Excluded	**Included**	Qualitative	Qualitative	Qualitative	Excluded	Pathway is complete for certain receptors. Groundwater in the area is considered potable; therefore, a Resident may be exposed to groundwater as drinking water. Construction, Utility, and Outdoor Workers are not anticipated to drink potable water onsite during construction or maintenance activities. Exposure and risk to offsite receptors will be discussed in the context of the onsite results as onsite concentrations, exposure, or both are expected to be greater. Site visitors and indoor workers will be discussed in the context of residents.
Dermal Contact Exposure - Groundwater as Potable Water	Excluded	Excluded	Excluded	**Included**	Qualitative	Qualitative	Qualitative	Excluded	Pathway is complete for certain receptors. Groundwater in the area is considered potable; therefore, a Resident may be exposed to groundwater as drinking water. Construction, Utility, and Outdoor Workers are not anticipated to drink potable water onsite during construction or maintenance activities. Exposure and risk to offsite receptors will be discussed in the context of the onsite results as onsite concentrations, exposure, or both are expected to be greater. Site visitors and indoor workers will be discussed in the context of residents.
Inhalation Exposure - Indoor Air	Excluded	Excluded	Excluded	**Included**	Qualitative	**Included**	Qualitative	Excluded	Pathway is complete for future onsite buildings. Construction and Utility Workers are not anticipated to spend considerable amounts of time inside future buildings; therefore, this pathway will be assessed through the Resident and onsite Indoor Worker scenarios. The indoor air pathway is potentially complete for offsite exposures and will be discussed qualitatively. Site Visitors will be discussed in the context of the Indoor Worker and Residents' results.
Inhalation Exposure - Outdoor Air (Volatiles)	**Included**	**Included**	**Included**	**Included**	Qualitative	Qualitative	Qualitative	Qualitative	Pathway is complete. Exposure and risk to offsite surface receptors will be evaluated through the onsite receptors. Exposure and risk to offsite Construction and Utility Workers will be evaluated in the context of the onsite results. Inhalation within trenches is considered for subsurface workers.
Inhalation Exposure - Outdoor Fugitive Dust (Derived from Soil)	**Included**	**Included**	**Included**	**Included**	Qualitative	Qualitative	Qualitative	Qualitative	Pathway is complete. Exposure and risk to offsite surface receptors will be evaluated through the onsite receptors. Exposure and risk to offsite Construction and Utility Workers will be evaluated in the context of the onsite results.
Ingestion Exposure - Garden Produce	Excluded	Excluded	Excluded	Qualitative	Excluded	Excluded	Excluded	Excluded	Pathway is potentially complete, and was qualitatively assessed due to the high degree of uncertainty associated with quantifying such exposures. The provision that no gardens for the purposes of growing produce are permitted at the RA Property unless produce is grown in an aboveground container will be included in the RMP.
Dermal Contact Exposure - Vapour Skin Contact	Qualitative	Qualitative	Qualitative	Qualitative	Qualitative	Qualitative	Qualitative	Qualitative	While this pathway is considered complete, it is typically insignificant in comparison to other routes of exposure. Therefore, this pathway was assessed qualitatively.

Notes:

Shaded cells indicate those receptor and pathway scenarios that will be evaluated quantitatively (calculations and modelling); all other scenarios will be assessed qualitatively based on the quantitative results unless indicated otherwise (for example, pathways are excluded if they are

Table 4-26. Human Health Toxicity Reference Values
Risk Assessment, 200 Beverley Street, Guelph, Ontario

Parameter	Toxicity Reference Value		Units	Effect/Basis	Study Population	Source	Originating Agency/Author	Candidate for Toxicity Profile [9]
Acenaphthene	RfD	0.06	mg/kg/day	Hepatotoxicity.	Mice	MECP, 2011	EPA IRIS, 1994	No
	RfD Sub-chronic	0.6	mg/kg/day	Increased liver weight.	Mice	MECP, 2011	ATSDR, 1995	No
	SF	0.001	1/[mg/kg/day]	Alimentary tract tumours (forestomach, esophagus, tongue, and larynx). Kalberlah et al. TEF (0.001) employed, see Benzo[a]pyrene.	Mice	MECP, 2018	EPA IRIS, 2017; Kalberlah et. al., 1995	No
	URF	0.0006	1/[mg/m^3]	Upper respiratory and upper digestive tract (forestomach) tumours. Kalberlah et al. TEF (0.001) employed, see Benzo[a]pyrene.	Hamsters	MECP, 2018	EPA IRIS, 2017; Kalberlah et. al., 1995	No
Acenaphthylene	URF	0.006	1/[mg/m^3]	Upper respiratory and upper digestive tract (forestomach) tumours. Kalberlah et al. TEF (0.01) employed, see Benzo[a]pyrene.	Hamsters	MECP, 2018	EPA IRIS, 2017; Kalberlah et. al., 1995	No
Anthracene	RfC [e]	0.05	mg/m^3	Surrogate (C9-C18 aromatic fraction) – hepatic and CNS effects.	Rats	MADEP, 2004	TPHCWG, 1997	Yes
	URF	0.006	1/[mg/m^3]	Upper respiratory and upper digestive tract (forestomach) tumours. Kalberlah et al. TEF (0.01) employed, see Benzo[a]pyrene.	Hamsters	MECP, 2018	EPA IRIS, 2017; Kalberlah et. al., 1995	No
Antimony (Sb)	RfD	0.006	mg/kg/day	Decreased body weight and food intake.	Rats	WHO DW, 2003	RIVM, 2009	Yes
Arsenic (As)	RfD	0.0003	mg/kg/day	Hyperpigmentation, keratosis, and possible vascular complications.	Humans	MECP, 2017	EPA IRIS, 1991; ATSDR, 2007	No
	SF	9.5	1/[mg/kg/day]	Lung cancer, multiple internal organ cancers (liver, kidney, lung, and bladder), skin cancer.	Humans	MECP, 2017	CalEPA DW, 2004	No
Benz[a]anthracene [c]	RfD	NA	mg/kg/day	None Selected.	-	-	-	No
	RfC	NA	mg/m^3	None Selected.	-	-	-	No
	SF	0.1	1/[mg/kg/day]	Alimentary tract tumours (forestomach, esophagus, tongue, and larynx). Kalberlah et al. TEF (0.1) employed, see Benzo[a]pyrene.	Mice	MECP, 2018	EPA IRIS, 2017; Kalberlah et. al., 1995	No
	URF	0.06	1/[mg/m^3]	Upper respiratory and upper digestive tract (forestomach) tumours. Kalberlah et al. TEF (0.1) employed, see Benzo[a]pyrene.	Hamsters	MECP, 2018	EPA IRIS, 2017; Kalberlah et. al., 1995	No
Benzene	RfC	0.0096	mg/m^3	Decreased lymphocyte count.	Humans	ATSDR, 2007	ATSDR, 2007	Yes
	URF	0.0022	1/[mg/m^3]	Leukemia.	Humans	MECP, 2011	EPA IRIS, 2000	No
Benzo[a]pyrene	RfD [d]	0.0003	mg/kg/day	Neurobehavioural changes (developmental).	Rats	MECP, 2018	EPA IRIS, 2017	No
	RfD Sub-chronic	0.005	mg/kg/day	Kidney abnormalities	Rats	MECP, 2018	CalEPA DW, 2010	No
	SF	1	1/[mg/kg/day]	Alimentary tract tumours (forestomach, esophagus, tongue, and larynx). Kalberlah et al. TEF (1) employed.	Mice	MECP, 2018	EPA IRIS, 2017; Kalberlah et. al., 1995	No
Benzo[b]fluoranthene [c]	RfD	NA	mg/kg/day	None Selected.	-	-	-	No
	SF	0.1	1/[mg/kg/day]	Alimentary tract tumours (forestomach, esophagus, tongue, and larynx). Kalberlah et al. TEF (0.1) employed, see Benzo[a]pyrene.	Mice	MECP, 2018	EPA IRIS, 2017; Kalberlah et. al., 1995	No
Benzo[g,h,i]perylene [c]	RfD	NA	mg/kg/day	None Selected.	-	-	-	No
	SF	0.01	1/[mg/kg/day]	Alimentary tract tumours (forestomach, esophagus, tongue, and larynx). Kalberlah et al. TEF (0.01) employed; see Benzo[a]pyrene.	Mice	MECP, 2018	EPA IRIS, 2017; Kalberlah et. al., 1995	No
Benzo[k]fluoranthene [c]	RfD	NA	mg/kg/day	None Selected.	-	-	-	No
	SF	0.1	1/[mg/kg/day]	Alimentary tract tumours (forestomach, esophagus, tongue, and larynx). Kalberlah et al. TEF (0.1) employed, see Benzo[a]pyrene.	Mice	MECP, 2018	EPA IRIS, 2017; Kalberlah et. al., 1995	No
Cadmium	RfD	0.0001	mg/kg/day	Renal toxicity.	Humans	ATSDR, 2012	-	Yes
	SF	NA	1/[mg/kg/day]	-	-	-	-	No
Chrysene	RfD	NA	mg/kg/day	None Selected.	-	-	-	No
	SF	0.01	1/[mg/kg/day]	Alimentary tract tumours (forestomach, esophagus, tongue, and larynx). Kalberlah et al. TEF (0.01) employed; see Benzo[a]pyrene.	Mice	MECP, 2018	EPA IRIS, 2017; Kalberlah et. al., 1995	No

Table 4-26. Human Health Toxicity Reference Values
Risk Assessment, 200 Beverley Street, Guelph, Ontario

Parameter	Toxicity Reference Value		Units	Effect/Basis	Study Population	Source	Originating Agency/Author	Candidate for Toxicity Profile [9]
Cobalt (Co)	RfD	0.001	mg/kg/day	Polycythemia (proportion of blood volume that is occupied by red blood cells increased).	Humans	MECP, 2011	ATSDR, 2004	No
	RfD Sub-chronic	0.01	mg/kg/day	Polycythemia (proportion of blood volume that is occupied by red blood cells increased).	Humans	MECP, 2011	ATSDR, 2004	No
Copper (Cu)	RfD	0.01	mg/kg/day	Gastrointestinal effects.	Humans	MECP, 2016e	ATSDR, 2004	No
Dibenz[a,h]anthracene [c]	RfD	NA	mg/kg/day	None Selected.	-	-	-	No
	SF	1	1/[mg/kg/day]	Alimentary tract tumours (forestomach, esophagus, tongue, and larynx). Kalberlah et al. TEF (1) employed; see Benzo[a]pyrene.	Mice	MECP, 2018	EPA IRIS, 2017; Kalberlah et. al., 1995	No
Dichloroethane, 1,1-	RfD	0.2	mg/kg/day	Renal toxicity.	Rats	EPA PPRTV, 2006	-	Yes
	RfD Sub-chronic	2	mg/kg/day	Renal toxicity.	Rats	EPA PPRTV, 2006		Yes
	RfC	0.165	mg/m^3	Kidney damage (for example, increased serum creatinine and urea).	Cats	MECP, 2011	EPA HEAST, 1984	No
	SF	0.0057	1/[mg/kg/day]	Mammary gland adenocarcinomas.	Rats	CalEPA DW, 2003	-	Yes
	URF	0.0016	$1/[mg/m^3]$	Mammary gland adenocarcinomas.	Rats	CalEPA DW, 2003	-	Yes
Dichloroethylene, 1,1-	RfD	0.05	mg/kg/day	Hepatic toxicity (fatty change).	Rats	MECP, 2016f	WHO CICAD, 2003; EPA IRIS, 2002	No
	RfC	0.2	mg/m^3	Hepatic toxicity (fatty change).	Rats	MECP, 2016f	WHO CICAD, 2003; EPA IRIS, 2002	No
	RfC Sub-chronic	0.0793	mg/m^3	Hepatic effects (mottled livers).	Guinea Pigs	MECP, 2011	ATSDR, 1994	No
Dichloroethylene, cis-1,2-	RfD	0.002	mg/kg/day	Increased kidney and liver weights; decrease hematocrit.	Rats	MECP, 2016a	EPA IRIS, 2010	No
	RfD Sub-chronic	0.017	mg/kg/day	Increased kidney and liver weights; decrease hematocrit.	Rats	MECP, 2016a	EPA PPRTV, 2011	No
	RfC	NA	mg/m^3	None Selected.	--	MECP, 2016a		No
Dichloroethylene, trans-1,2- [f]	RfD	0.02	mg/kg/day	Decrease in number of antibody forming cells.	Mice	MECP, 2016b	EPA IRIS, 2010	No
	RfD Sub-chronic	0.065	mg/kg/day	Decrease in number of antibody forming cells.	Mice	MECP, 2016b	EPA IRIS, 2010 (modified) [a]	No
	RfC	0.06	mg/m^3	Fatty degeneration of the liver lobules and Kupffer cells, and pulmonary hyperaemia, alveolar septal distension, and pneumonic infiltration.	Rats	MECP, 2016b	RIVM, 2001; MECP, 2011	No
	RfC Sub-chronic	0.793	mg/m^3	Fatty degeneration of the liver.	Rats	MECP, 2011	ATSDR, 1996	No
Ethylbenzene	RfD	0.1	mg/kg/day	Liver and kidney toxicity.	Rats	MECP, 2016f	EPA IRIS, 1987; RIVM, 2001; WHO DW, 2003; HC CSD, 2010	No
	RfD Sub-chronic	0.4	mg/kg/day	Hepatotoxicity	Rats	MECP, 2016f	ATSDR, 2010	No
	RfC	1.9	mg/m^3	Increased severity of nephropathy.	Rats	MECP, 2016f	TCEQ, 2010; CalEPA chREL, 2000	No
Fluoranthene	RfD	0.04	mg/kg/day	Nephropathy, increased liver weights, hematological alterations, and clinical effects.	Mice	MECP, 2011	EPA IRIS, 1993	No
	RfD Sub-chronic	0.4	mg/kg/day	Nephropathy, increased liver weights, hematological alterations, and clinical effects.	Mice	MECP, 2011	EPA IRIS, 1993 (modified) [a]	No
	SF	0.01	1/[mg/kg/day]	Alimentary tract tumours (forestomach, esophagus, tongue, and larynx). Kalberlah et al. TEF (0.01) employed; see Benzo[a]pyrene.	Mice	MECP, 2018	EPA IRIS, 2017; Kalberlah et. al., 1995	No
Fluorene	RfC	0.05	mg/m^3	CNS effects and increased liver and kidney weight.	Rats	MADEP, 2003	-	Yes
Indeno[1,2,3-cd]pyrene [c]	RfD	NA	mg/kg/day	None Selected.	-	-	-	No
	SF	0.1	1/[mg/kg/day]	Alimentary tract tumours (forestomach, esophagus, tongue, and larynx). Kalberlah et al. TEF (0.1) employed, see Benzo[a]pyrene.	Mice	MECP, 2018	EPA IRIS, 2017; Kalberlah et. al., 1995	No
Iron	RfD	0.7	mg/kg/day	Adverse gastrointestinal effects.	Humans	EPA RSL, 2013	EPA PPRTV, 2006	Yes
Lead	NA	NA	NA	-	-		-	-
Mercury (elemental)	RfC	0.00003	mg/m^3	Impairment of neurobehavioral functions.	Humans	CalEPA, 2014	-	Yes
2-(1-)Methylnaphthalene	RfC	0.05	mg/m^3	CNS effects and increased liver and kidney weight.	Rats	MADEP, 2003	-	Yes
Naphthalene	RfC	0.0037	mg/m^3	Nasal effects: hyperplasia and metaplasia of respiratory and olfactory epithelium.	Mice	MECP, 2011	ATSDR, 2005	No

Table 4-26. Human Health Toxicity Reference Values
Risk Assessment, 200 Beverley Street, Guelph, Ontario

Parameter	Toxicity Reference Value		Units	Effect/Basis	Study Population	Source	Originating Agency/Author	Candidate for Toxicity Profile [9]
n-Hexane	RfD	0.06	mg/kg/day	Nervous system-neuropathy; Testicular atrophy.	Rats	EPA HEAST, 1997	-	Yes
	RfD Sub-chronic	0.6	mg/kg/day	Nervous system-neuropathy; Testicular atrophy.	Rats	EPA HEAST, 1997	-	Yes
	RfC	0.7	mg/m^3	Neurotoxic effects (functional impairment of the peripheral nervous system).	Rats	EPA IRIS, 2005	-	Yes
PHC F1 (C6-C10)								
Aliphatic (C6 - C8)	RfC	18.4	mg/m^3	Neurotoxicity.	Mice, Rats	MECP, 2011	TPHCWG, 1997; CCME, 2000	No
Aliphatic (C8 - C10)	RfC	1	mg/m^3	Hepatic and hematological changes.	Rats	MECP, 2011	TPHCWG, 1997; CCME, 2000	No
Aromatic (C8 - C10)	RfC	0.2	mg/m^3	Decreased body weight.	Rats	MECP, 2011	TPHCWG, 1997; CCME, 2000	No
PHC F2 (C10-C16)								
Aliphatic (C>10 - C12)	RfD	0.1	mg/kg/day	Hepatic and hematological changes.	Rats	MECP, 2011	TPHCWG, 1997; CCME, 2000	No
	RfD Sub-chronic	1	mg/kg/day	Hepatic and hematological changes.	Rats	MECP, 2011	TPHCWG, 1997; CCME, 2000	No
	RfC	1	mg/m^3	Hepatic and hematological changes.	Rats	MECP, 2011	TPHCWG, 1997; CCME, 2000	No
Aliphatic (C>12 - C16)	RfD	0.1	mg/kg/day	Hepatic and hematological changes.	Rats	MECP, 2011	TPHCWG, 1997; CCME, 2000	No
	RfD Sub-chronic	1	mg/kg/day	Hepatic and hematological changes.	Rats	MECP, 2011	TPHCWG, 1997; CCME, 2000	No
	RfC	1	mg/m^3	Hepatic and hematological changes.	Rats	MECP, 2011	TPHCWG, 1997; CCME, 2000	No
Aromatic (C>10 - C12)	RfD	0.04	mg/kg/day	Decreased body weight.	Mice, Rats	MECP, 2011	TPHCWG, 1997; CCME, 2000	No
	RfC	0.2	mg/m^3	Decreased body weight.	Rats	MECP, 2011	TPHCWG, 1997; CCME, 2000	No
Aromatic (C>12 - C16)	RfD	0.04	mg/kg/day	Decreased body weight.	Mice, Rats	MECP, 2011	TPHCWG, 1997; CCME, 2000	No
	RfC	0.2	mg/m^3	Decreased body weight.	Rats	MECP, 2011	TPHCWG, 1997; CCME, 2000	No
PHC F3 (C16-C34)								
Aliphatic (C>16 - C21) [b]	RfD	2	mg/kg/day	Hepatic (foreign body reaction) granuloma.	Mice	MECP, 2011	TPHCWG, 1997; CCME, 2000	No
Aliphatic (C>21 - C34) [b]	RfD	2	mg/kg/day	Hepatic (foreign body reaction) granuloma.	Mice	MECP, 2011	TPHCWG, 1997; CCME, 2000	No
Aromatic (C>16 - C21) [b]	RfD	0.03	mg/kg/day	Nephrotoxcity.	Mice	MECP, 2011	TPHCWG, 1997; CCME, 2000	No
	RfD Sub-chronic	0.3	mg/kg/day	Nephrotoxcity.	Mice	MECP, 2011	TPHCWG, 1997; CCME, 2000	No
Aromatic (C>21 - C34) [b]	RfD	0.03	mg/kg/day	Nephrotoxcity.	Mice	MECP, 2011	TPHCWG, 1997; CCME, 2000	No
	RfD Sub-chronic	0.3	mg/kg/day	Nephrotoxcity.	Mice	MECP, 2011	TPHCWG, 1997; CCME, 2000	No
PHC F4 (C34-C50)/F4G-SG (GHH-Silica)								
Aliphatic (C>34) [b]	RfD	20	mg/kg/day	Hepatic (foreign body reaction) granuloma.	Mice	MECP, 2011	TPHCWG, 1997; CCME, 2000	No
Aromatic (C>34) [b]	RfD	0.03	mg/kg/day	Nephrotoxcity.	Mice	MECP, 2011	TPHCWG, 1997; CCME, 2000	No
	RfD Sub-chronic	0.3	mg/kg/day	Nephrotoxcity.	Mice	MECP, 2011	TPHCWG, 1997; CCME, 2000	No
Phenanthrene	RfD	0.04	mg/kg/day	Applicable to the non-carcinogenic C9 to C16 aromatic total petroleum hydrocarbon fraction (or its constituents) and is based on decreased body weight and increased liver and kidney weight.	Mice, Rats	RIVM, 2001	-	Yes
	RfC	0.05	mg/m^3	CNS effects and increased liver and kidney weight.	Rats	MADEP, 2004	-	Yes
Polychlorinated Biphenyls	RfD	0.00002	mg/kg/day	Immunological effects.	Monkeys	MECP, 2011	ATSDR, 2000	No
	RfD Sub-chronic	0.00003	mg/kg/day	Neurobehavioral alterations.	Monkeys	MECP, 2011	ATSDR, 2000	No
Pyrene	RfD	0.03	mg/kg/day	Kidney effects (renal tubular pathology, decreased kidney weights).	Mice	MECP, 2011	EPA IRIS, 1993	No
	RfD Sub-chronic	0.3	mg/kg/day	Kidney effects (renal tubular pathology, decreased kidney weights).	Mice	MECP, 2011	EPA IRIS, 1993	No
	SF	0.001	1/[mg/kg/day]	Alimentary tract tumours (forestomach, esophagus, tongue, and larynx). Kalberlah et al. TEF (0.001) employed, see Benzo[a]pyrene.	Mice	MECP, 2018	EPA IRIS, 2017; Kalberlah et. al., 1995	No
	URF	0.0006	$1/[mg/m^3]$	Upper respiratory and upper digestive tract (forestomach) tumours. Kalberlah et al. TEF (0.001) employed, see Benzo[a]pyrene.	Hamsters	MECP, 2018	EPA IRIS, 2017; Kalberlah et. al., 1995	No

Table 4-26. Human Health Toxicity Reference Values
Risk Assessment, 200 Beverley Street, Guelph, Ontario

Parameter	Toxicity Reference Value		Units	Effect/Basis	Study Population	Source	Originating Agency/Author	Candidate for Toxicity Profile [9]
Tetrachloroethylene	RfC	0.04	mg/m^3	Neurotoxicity - occupational exposures.	Humans	MECP, 2014a	EPA IRIS, 2012	No
	RfC Sub-chronic	1.36	mg/m^3	Neurotoxicity.	Humans	MECP, 2011	ATSDR, 1997	No
	URF	0.00026	$1/[mg/m^3]$	Hepatocellular adenomas or carcinomas.	Mice	MECP, 2014a	EPA IRIS, 2012	No
Thallium	RfD	0.0000135	mg/kg/day	Alopecia.	Rats	MECP, 2011	CalEPA DW, 1999	No
Trichloroethane, 1,1,1-	RfC	1	mg/m^3	Neuropathic effects	Gerbils	MECP, 2011	-	No
	RfC Sub-chronic	3.82	mg/m^3	Neuropathic effects	Gerbils	MECP, 2011	-	No
Trichloroethylene	RfD [d]	0.0005	mg/kg/day	Multiple: Developmental immunotoxicity, decreased thymus weights in mice, and heart malformations in rats.	Mice, Rats	MECP, 2014b	EPA IRIS, 2011; ATSDR, 2013	No
	RfC [d]	0.002	mg/m^3	Multiple: Decreased thymus weights in mice and heart malformations in rats.	Mice, Rats	MECP, 2014b	EPA IRIS, 2011; ATSDR, 2013	No
	SF	0.046	1/[mg/kg/day]	Kidney, non-Hodgkin lymphoma, and liver cancers.	Humans, Mice	MECP, 2014b	EPA IRIS, 2011; ATSDR, 2013	No
	URF	0.0041	$1/[mg/m^3]$	Kidney, non-Hodgkin lymphoma, and liver cancers.	Humans, Mice	MECP, 2014b	EPA IRIS, 2011	No
Vanadium (V)	RfD [d]	0.0021	mg/kg/day	Developmental effects in offspring.	Rats	MECP, 2011	CalEPA DW, 2000	No
	RfD Sub-chronic [d]	0.0021	mg/kg/day	Developmental effects in offspring.	Rats	MECP, 2011	CalEPA DW, 2000	No
Vinyl Chloride	RfD	0.003	mg/kg/day	Liver cell polymorphism.	Rats	MECP, 2016c	ATSDR, 2006; EPA IRIS, 2000; MECP, 2011	No
	RfC	0.06	mg/m^3	Liver cell polymorphism.	Rats	MECP, 2016c	TCEQ, 2009	No
	SF (continuous lifetime exposure from birth)	1.5	1/[mg/kg/day]	Total of liver angiosarcoma, hepatocellular carcinoma, and neoplastic nodules.	Rats	MECP, 2016c	WHO DW, 2011	No
	SF (continuous lifetime exposure during adulthood)	0.72	1/[mg/kg/day]	Total of liver angiosarcoma, hepatocellular carcinoma, and neoplastic nodules.	Rats	MECP, 2016c	EPA IRIS, 2000	No
	URF (continuous lifetime exposure from birth)	0.0084	$1/[mg/m^3]$	Liver angiosarcomas, angiomas, hepatomas, and neoplastic nodules.	Rats	MECP, 2016c	TCEQ, 2009	No
	URF (continuous lifetime exposure during adulthood)	0.0044	$1/[mg/m^3]$	Liver angiosarcomas, angiomas, hepatomas, and neoplastic nodules.	Rats	MECP, 2016c	EPA IRIS, 2000	No
Xylene Mixture	RfC	0.7	mg/m^3	CNS effects; and irritation of the eyes, nose, and throat.	Humans	MECP, 2011	CalEPA ChREL, 2005	No
	RfC Sub-chronic	2.6	mg/m^3	Neurotoxicity.	Rats	MECP, 2011	ATSDR, 2007	No
Zinc	RfD	0.3	mg/kg/day	Decreases in erythrocyte Cu, Zn-superoxide dismutase (ESOD) activity.	Humans	MECP, 2011	EPA IRIS, 2005	No

[a.] MECP derived toxicity values by modifying the proposed values in the cited source documents.

[b.] Chemical is not considered a concern for inhalation exposure and toxicity.

[c.] Noncancer TRV not available. Consistent with MECP (2011) Rationale Table.

[d.] Additional consideration for developmental effects required for this chemical and route of exposure.

[e.] Proxy or surrogate is chosen based on chemical's structural or functional similarity.

[f.] RfC for trans-1,2-dichloroethylene was used in the risk calculations as a surrogate in the absence of an MECP-selected TRV. RIVM (2009b) indicates that new genotoxicity studies conclude that "there is no clear evidence for differences in toxicity between the cis and the trans-isomer", therefore the use of the trans- isomer is an appropriate surrogate.

[g.] Toxicity Profiles to be provided in the risk assessment specific to the TRVs used in the RA following the secondary screening for human health.

Table 4-39. Determination of Toxicity from Nutritionally Essential Elements in RA Property Soil

Risk Assessment, 200 Beverley Street, Guelph, Ontario

Element	RDA/AI [a]	UL [a, b]	Exposure Point Concentration - Soil	Soil Intake [c]	Site Intake/ RDA = >1?	Site Intake/ UL = >1?
	mg/day	mg/day	(mg/kg)	(mg/day)		
Calcium	700	2500	260000	52	0.07	0.02
Magnesium	80	65	140000	28	0.35	0.43

[a.] Obtained from Health Canada, Dietary Reference Intake Tables. Values for children aged 1-3 selected. https://www.canada.ca/content/dam/hc-sc/migration/hc-sc/fn-an/alt_formats/hpfb-dgpsa/pdf/nutrition/dri_tables-eng.pdf

[b.] The "UL for magnesium represents intake from a pharmacological agent only and does not include intake from food and water."

[c.] Soil intake is conservatively calculated based on a maximum soil ingestion rate of 200 mg/day, consistent with a toddlers ingestion exposure to soil.

Notes:

= = equals

> = greater than

AI = adequate intake

L/d = litre(s) per day

mg/day = milligram(s) per day

mg/kg = milligram(s) per kilogram

mg/L = milligram(s) per litre

NA = not applicable

RDA = recommended daily allowance

UL = tolerable upper intake level

[a] Concentration used in risk calculations in Section 4, as presented in Table 4-1.

[b] Refer to Table 4-31. Risks only shown for quantitatively assessed COCs.

[c] RBC calculated using RBC=TR*Cs/Risk, where TR is the MECP Target Risk of either 10^{-6} (ILCR), 0.2 (HQ for non-PHC COCs), or 0.5 (HQ for PHC COCs), Cs is the soil concentration used in the RA, and Risk is the estimated risk calculated in the RA.

[d] The direct contact (S1) value or equivalent alternate value was applied as the RBC for parameters not retained for quantitative assessment of the direct contact pathway through the secondary screening. Refer to Table F-3.

[e] RBC_{DC} is the lowest of the calculated RBCs for all receptors, with the exception of conductivity, bismuth, calcium, and magnesium, where the estimated maximum concentrations were selected (as no risks predicted at the estimate maximums via the qualitative assessment in Section 4.4.3); and lead, where the Table 1 Standard was selected. Values are rounded down to two significant digits.

Notes:
The RBCs for COCs not applicable to human health (for this RA, conductivity) are set to the estimated maximum concentration in soil.
The RBC for lead is set to the Ontario soil background concentration.
These RBCs would be appropriate for soil that falls in the appropriate pH range (5-9). For development of fill cap target concentrations, see Section 6.

[a] Concentration used in risk calculations in Section 4, as presented in Table 4-1.

[b] Refer to Table 4-31. Risks only shown for quantitatively assessed COCs.

[c] RBC calculated using RBC=TR*Cs/Risk, where TR is the MECP Target Risk of either 10^{-6} (ILCR), 0.2 (HQ for non-PHC COCs), or 0.5 (HQ for PHC COCs), Cs is the soil concentration used in the RA, and Risk is the estimated risk calculated in the RA.

[d] The Table 2 direct contact (S3) value (specific to subsurface workers for an industrial/commercial land use) was applied as the RBC for parameters not retained for quantitative assessment of the direct contact pathway through the secondary screening (using the more conservative S1 values for residents). The S3 values are most applicable to subsurface workers as the RBC; therefore, these values instead of the S1 values were adopted as the RBCs for qualitatively assessed COCs.

Table 4-~~41b~~42b. Derivation of Soil RBCs Based on Direct Contact (Dermal and Ingestion) - Subsurface Workers
Risk Assessment, 200 Beverley Street, Guelph, Ontario

COCs	Receptor	Utility Worker		Construction Worker		Adult Female Construction/ Utility Worker	Utility Worker		Construction Worker		Female Outdoor/ Utility/ Construction Worker	Direct Contact [d] (S3)	Overall RBC_{DC} [e] (µg/g)
	Estimated Maximum Concentration [a] (µg/g)	Estimated ILCR [b]	Estimated HQ [b]	Estimated ILCR [b]	Estimated HQ [b]	Estimated HQ [b]	RBC_C [c] (µg/g)	RBC_{NC} [c] (µg/g)	RBC_C [c] (µg/g)	RBC_{NC} [c] (µg/g)	RBC_{NC} [c] (µg/g)		

[e] RBC_{DC} is the lowest of the calculated RBCs for all receptors, with the exception of conductivity, bismuth, calcium, and magnesium, where the estimated maximum concentrations were selected (as no risks predicted at the estimate maximums via the qualitative assessment in Section 4.4.3); and lead, where the Table 1 Standard was selected. Values are rounded down to two significant digits.

Notes:
The RBCs for COCs not applicable to human health (for this RA, conductivity) are set to the estimated maximum concentration in soil.
The RBC for lead is set to the Ontario soil background concentration.
These RBCs would be appropriate for soil that falls in the appropriate pH range (5-9). For development of fill cap target concentrations, see Section 6.

[a.] Concentration used in risk calculations in Section 4, as presented in Table 4-1.

[b.] Refer to Table 4-34b. Risks only shown for quantitatively assessed COCs.

[c.] RBC calculated using RBC=TR*Cs/Risk, where TR is the MECP Target Risk of either 10-6 (ILCR), 0.2 (HQ for non-PHC COCs), or 0.5 (HQ for PHCs and TCE), Cs is the soil concentration used in the RA, and Risk is the estimated risk calculated in the RA.

[d.] An RBC_{S-IA} is not provided for nonvolatile COCs or COCs without S-IA component values (shown as "NA").

Notes:

These RBCs would be appropriate for soil that falls in the appropriate pH range (5-9). For development of fill cap target concentrations, see Section 6.

-- = no value (COC is considered volatile but no value is available)
µg/g = microgram(s) per gram
COC = contaminant of concern
F = fraction
HQ = hazard quotient
ILCR = incremental lifetime cancer risk
MECP = Ontario Ministry of the Environment, Conservation and Parks
NA = not applicable (COC is not considered volatile)
PHC = petroleum hydrocarbon
RA = Risk Assessment
RBC = risk-based back-calculation concentration
RBC_{C} = RBC cancer
RBC_{NC} = RBC noncancer
RBC_{S-IA} = RBC soil to indoor air
TCE = trichloroethylene

[a] Ontario Regulation 153/04, Table 6: Generic Site Condition Standards for Shallow Soils in a Potable Ground Water Condition for residential/parkland/institutional use and Coarse Textured Soils (MECP, 2011).
[b] Obtained from Table 4-~~41~~42 of this RA report.
[c] Obtained from Table 4-~~42a~~43a of this RA report.
[d] RBC for fill cap is equal to the lowest of the Direct Contact RBC or Inhalation RBC for each COC, except when the calculated RBC is less than the Table 6 Standard or where an inhalation RBC is applicable, but there is no value selected. In these cases, the Table 6 Standard is selected. The RBCs for COCs not applicable to human health (for this RA, conductivity) are set to the estimated maximum in soil. Further discussion is provided in Section 6.

µg/g = microgram(s) per gram
COC = contaminant of concern
F = fraction
HH = human health
Max = maximum
MECP = Ministry of the Environment, Conservation and Parks
NA = not applicable
PCB = polychlorinated biphenyls
RA = Risk Assessment
RBC = risk-based back-calculation concentration
RMM = risk management measure
SCS = Site Condition Standard
VI = vapour intrusion

[a.] Concentration used in risk calculations in Section 4, as presented in Table 4-2.
[b.] Refer to Table 4-32a. Risks only shown for quantitatively assessed COCs.
[c.] RBC calculated using RBC=TR*Cs/Risk, where TR is the Ministry Target Risk of either 10-6 (ILCR), 0.2 (HQ for non-PHC COCs), or 0.5 (HQ for PHC COCs), Cs is the soil concentration used in the RA, and Risk is the estimated risk calculated in the RA.
[d.] The direct contact (GW1) value or equivalent alternate value was applied as the RBC for parameters not retained for quantitative assessment of the direct contact pathway through the secondary screening. Refer to Table F-4.
[e.] RBC_{DC} is the lowest of the calculated RBCs for all receptors, with the exception of lead. Values are rounded down to two significant digits.

Notes:
The RBC for lead is set to the Ontario soil background concentration.
These RBCs would be appropriate for soil that falls in the appropriate pH range (5-9). For development of fill cap target concentrations, see Section 6.

µg/g = microgram(s) per gram
-- = no value
µg/g = microgram(s) per gram
COC = contaminant of concern
EPA = U.S. Environmental Protection Agency
F = fraction
HH = human health
HQ = hazard quotient
HWE = hot water extractable
ILCR = incremental lifetime cancer risk
MECP = Ontario Ministry of the Environment, Conservation and Parks
NA = not applicable
PHC = petroleum hydrocarbon
RA = Risk Assessment
RBC = risk-based back-calculation concentration
RBC_{C} = RBC cancer
RBC_{DC} = RBC direct contact
RBC_{NC} = RBC noncancer
GW1 = direct contact component value

[a.] Concentration used in risk calculations in Section 4, as presented in Table 4-2.

[b.] Refer to Table 4-35a. Risks only shown for quantitatively assessed COCs.

[c.] RBC calculated using RBC=TR*Cgw/Risk, where TR is the MECP Target Risk of either 10^{-6} (ILCR), 0.2 (HQ for non-PHC COCs), or 0.5 (HQ for PHC and TCE), Cgw is the groundwater concentration used in the RA, and Risk is the estimated risk calculated in the RA.

[d.] RBC is the lowest of the calculated RBCs for all receptors. An RBC is not calculated for nonvolatile COCs and COCs not retained for inhalation analysis, refer to Appendix F2 (shown as "NA").

Notes:

-- = no value

µg/L = microgram(s) per litre

COC = contaminant of concern

F = fraction

HQ = hazard quotient

ILCR = incremental lifetime cancer risk

MECP = Ontario Ministry of the Environment, Conservation and Parks

NA = not applicable

[a] Estimated maximum concentrations are presented based on the higher contribution to volatiles in outdoor air from soil (Table G3-3). Soil concentrations used in risk calculations in Section 4, as presented in Table 4-1.

[b] Refer to Table 4-29. Risks only shown for quantitatively assessed COCs.

[c] RBC calculated using RBC=TR*Cs/Risk, where TR is the MECP Target Risk of either 10^{-6} (ILCR), 0.2 (HQ for non-PHC COCs), or 0.5 (HQ for TCE and PHC COCs), Cs is the soil concentration used in the RA, and Risk is the estimated

[d] RBC_{OA} is the lowest of the calculated RBCs for all receptors. An RBC_{OA} is not calculated for nonvolatile COCs (shown as "NA").

These RBCs would be appropriate for soil that falls in the appropriate pH range (5-9). For development of fill cap target concentrations, see Section 6.

Notes:

Shaded values are groundwater concentrations (that is, not soil). Units are µg/L. Risk was driven by groundwater for the outdoor air pathway. Cis-1,2-dichloroethene, trans-1,2-dichloroethene, and vinyl chloride were only retained as COCs in groundwater [not soil]). Soil RBCs for 2-(1-)Methylnaphthalene and PHC F2 are 1,100 µg/g and 8,300 µg/g, respectively.

-- = no value

µg/g = microgram(s) per gram

µg/L = microgram(s) per litre

COC = contaminant of concern

F = fraction

HQ = hazard quotient

ILCR = incremental lifetime cancer risk

MECP = Ontario Ministry of the Environment, Conservation and Parks

NA = not applicable

PHC = petroleum hydrocarbon

Table 5-1. Species at Risk Occurrences within 1 km^2 of the RA Property

Risk Assessment, 200 Beverly Street, Guelph, Ontario

Species (Common Name)	Species (*Latin Name*)	Preferred Habitat [a]	Ontario (S-Rank)	COSEWIC	MNRF Status/ SARO	Likelihood and Last Observation [b]
Birds						
Eastern Wood-Pewee	Contopus virens	Lives in the mid-canopy layer of forest clearings and edges of deciduous and mixed forests. Most abundant in intermediate-age mature forest stands with little understory vegetation.	S4B	SC	SC	None, habitat not present. Last observed date not provided.
Barn Swallow	*Hirundo rustica*	Live in close proximity of humans. Build their nests in open barns, under bridges, and in culverts.	S4B	THR	THR	None, habitat not present. Last observed date not provided.
Wood Thrush	*Hylocichla mustelina*	Lives in mature deciduous and mixed forests. Seek moist stands of trees with well developed undergrowth.	S4B	THR	SC	None, habitat not present. Last observed date not provided.
Invertebrates						
Speckled Giant Lacewing	*Polystoechotes punctatus*	Streamside vegetation, especially in woods.	SH	-	-	None, habitat not present. Last observed in August 1948.
American burying beetle	Nicrophorus americanus	Prefers undisturbed deciduous forest but have been found in many kinds of habitat.	SH	EXP	EXP	None, habitat not present. Has not been present in Ontario since 1972. Last observed September 1930.
Insects						
Painted Skimmer	*Libellula semifasciata*	Ponds and other still bodies of water, especially boggy ones with emergent plants, and often within forest.	S2	-	-	None, habitat not present. Last observed on May 26, 1913.
Yellow-Banded Bumble Bee	*Bombus terricola*	Prefers mixed woodlands, but have been found in native grasslands, farmlands, and urban areas. Abandoned rodent burrows or decomposing logs are used as nest sites.	S3/ S5	SC	SC	None, habitat not present. Last observed date not provided.

Table 5-1. Species at Risk Occurrences within 1 km^2 of the RA Property

Risk Assessment, 200 Beverly Street, Guelph, Ontario

Species (Common Name)	Species (*Latin Name*)	Preferred Habitat [a]	Ontario (S-Rank)	COSEWIC	MNRF Status/ SARO	Likelihood and Last Observation [b]
Reptiles						
Northern Map Turtle	*Graptemys geographica*	Areas of medium to large open water in lakes with emerging woody debris and abundant molluscs.	S3	SC	SC	None, habitat not present. Last observed in July 1924.
Eastern Milksnake	*Lampropeltis triangulum*	Open habitats such as rocky outcrops, fields and forest edge. The milksnake hibernates underground, in rotting logs or in the foundations of old buildings.	S3	SC	SC	None, while concrete foundations are present at the RA Property, other habitat requirements are not present. Last observed on September 28, 1978.

Notes:

[a.] Information obtained from the following sources accessed on May 20, 2020:

- Ontario Ministry of Natural Resources and Forestry Website: https://www.ontario.ca/environment-and-energy/species-risk-ontario-list
- The International Union for Conservation of Nature and Natural Resources Red List Website: http://www.iucnredlist.org/
- University of Maryland Biodiversity Project catalogue website: https://www.marylandbiodiversity.com/

[b.] Likelihood of species being present on RA Property. Last observation obtained from the MNRF (2020) NHIC database.

Notes:

- = not applicable

B = breeding

COSEWIC = Committee on the Status of Endangered Wildlife in Canada

END = Endangered

EXP = Extirpated

km^2 = square kilometre(s)

m = metre(s)

MNRF = Ontario Ministry of Natural Resources and Forestry

NHIC = Natural Heritage Information Centre

RA = Risk Assessment

S-Rank = Subnational Rank

S1 = Critically Imperiled (often 5 or fewer occurrences)

S2 = Imperiled (often 20 or fewer occurrences)

S3 = Vulnerable (restricted range with relatively few populations - often 80 or fewer)

S4 = Uncommon but not rare; some cause for long-term concern due to declines or other factors

SARO = Species at Risk in Ontario

SH= Possibly extirpated (historically) but may be rediscovered.

SC = Special Concern

THR =Threatened

Table 5-2. Ecological Receptors and VECs for the RA Property

Risk Assessment, 200 Beverley Street, Guelph, Ontario

Ecological Receptors	VECs
Terrestrial Receptors	
Soil organisms	Earthworms
Terrestrial vegetation	Grasses Manitoba Maple (*Acer negundo*)
Birds	American Woodcock (*Scolopax minor*) Red-winged Blackbird (*Agelarius phoeniceus*) Red-tailed Hawk (*Buteo jamaicensis*)
Mammals	Meadow Vole (*Microtus pennsylvanicus*) Short-tailed Shrew (*Blarina brevicauda*) Red Fox (*Vulpes vulpes*)
Aquatic Receptors	
Pelagic invertebrates	Water fleas (*Daphnia sp.*)
Fish	Common Shiner (*Luxilus cornutus*)
	Northern Pike (*Esox lucius*)
Amphibians	Green Frog (*Rana clamitans*)
Reptiles	Midland painted turtle (*Chrysemys picta marginata*)
Aquatic vegetation	Sedges (*Carex spp*)

Notes:

RA = Risk Assessment

VEC = valued ecological component

Table 5-3. Exposure Pathway Analysis

Risk Assessment, 200 Beverley Street, Guelph, Ontario

Receptor	Potential Exposure Route	Pathway Potentially Complete	Pathway Quantitatively Assessed in ERA	Rationale
Terrestrial Receptors				
Soil Organisms	Ingestion or dermal contact with soil	Yes	Yes	Ingestion of soil is considered the primary route of exposure. Soil organisms often come into direct contact with COCs that can be readily transmitted through moist dermal layers.
	Vapour (volatiles) and soil inhalation (particulates)	Yes	No (qualitative)	Vapour and soil inhalation of COCs is considered a minor exposure pathway. Little or no toxicity information is available on inhalation of COCs.
	Dermal contact with groundwater	Yes	No	Dermal contact with groundwater is considered a minor exposure route, as these receptors avoid saturated ground conditions, there is a lack of data to adequately evaluate these effects, and risks to these ecological receptors are better assessed through the evaluation of other exposure pathways (that is, soil).
Terrestrial Plants	Root uptake from soil	Yes	Yes	Root uptake from soil by plants is a primary route of exposure.
	Root uptake from groundwater	Yes	Yes	Minimum depth to groundwater is 0.94 mbgs, which is potentially within the rooting depths of some plants present or expected to be present.
	Stem or foliar uptake from ambient air	Yes	No (qualitative)	These are secondary routes of exposure. Limited toxicological information is available to evaluate these pathways.
Birds and Mammals	Ingestion of soil	Yes	Yes	Ingestion of soil is a route of exposure to COCs at the RA Property.
	Ingestion of surface water	Yes	No	Surface water is not present onsite, and ingestion of offsite surface water is considered a minor exposure pathway to COCs for birds and mammals.
	Dermal contact with groundwater	Yes	No	Dermal contact with groundwater was considered a minor exposure route, as these receptors avoid saturated ground conditions, there is a lack of data to adequately evaluate these effects, and risks to these ecological receptors are better assessed through the evaluation of other exposure pathways (that is, soil).

Table 5-3. Exposure Pathway Analysis

Risk Assessment, 200 Beverley Street, Guelph, Ontario

Receptor	Potential Exposure Route	Pathway Potentially Complete	Pathway Quantitatively Assessed in ERA	Rationale
	Vapour (volatiles) and soil inhalation (particulates)	Yes	No (qualitative)	Inhalation of COCs is not considered a major exposure pathway. Little or no toxicity information is available on inhalation of COCs.
	Dermal contact with soil	Yes	No (qualitative)	Dermal contact with soil could be a route of exposure; however, little toxicity information exists on dermal contact with COCs, and the presence of fur on mammals and feathers on birds limits exposure.
	Ingestion of prey or food	Yes	Yes	Food-chain transport is a route of exposure for birds and mammals at the RA Property.
Aquatic Receptors				
Pelagic Invertebrates, Fish, Reptiles, and Amphibians	Dermal contact and ingestion of surface water (influenced by RA Property groundwater)	Yes	No (qualitative)	Dermal contact and ingestion of surface water is considered the primary route of exposure to COCs. Effects on these receptors are best assessed through use of the APVs based on the objectives of those values.
Aquatic Plants	Uptake of surface water through roots, leaves, and stems (influenced by RA Property groundwater)	Yes	No (qualitative)	Uptake of surface water through roots, leaves, and stems is considered the primary route of exposure to COCs and is best assessed through use of the APVs based on the objectives of those values.
Benthic Invertebrates	Dermal contact and ingestion of soil from the RA Property migrating to a water body via erosion	No	No	No water bodies are located within 30 m of the RA Property; therefore, soil erosion to a water body is not possible.

Notes:

APV = aquatic protection values

COC = contaminant of concern

ERA = Ecological Risk Assessment

mbgs = metre(s) below ground surface

RA = Risk Assessment

Table 5-4. Exposure Point Concentrations for Soil

Risk Assessment, 200 Beverley Street, Guelph, Ontario

[f.] MECP. 2011. Rationale for the Development of Soil and Ground Water Standards for Use at Contaminated Sites in Ontario. Value adjusted per the procedure outlined in Section 8.3.1 of the Rationale Document.

Notes:

-- = no value

µg/g = microgram(s) per gram

COC = contaminant of concern

EcoBMC = ecological benchmark concentration

Eco-SSL = ecological soil screening level

F = fraction

HMW = high molecular weight

LMW = low molecular weight

MECP = Ontario Ministry of the Environment, Conservation and Parks

ODEQ = Oregon Department of Environmental Quality

PAH = polycyclic aromatic hydrocarbon

PCB = polychlorinated biphenyl

EPA = U.S. Environmental Protection Agency

Table 5-6b. Summary of Ecological Benchmark Concentrations Used in the Assessment of COCs in Soil - Birds and Mammals

Risk Assessment, 200 Beverley Street, Guelph, Ontario

COC	Units	EcoBMC - Birds and Mammals	Basis	Notes and References
2-(1-)Methylnaphthalene	µg/g	100	Mammals	USEPA Eco-SSL [a,b]
Acenaphthene	µg/g	6600	Short-tailed Shrew	MECP Bird and Mammal Component Value [c]
Acenaphthylene	µg/g	100	Mammals	USEPA Eco-SSL [a,b]
Anthracene	µg/g	38000	Short-tailed Shrew	MECP Bird and Mammal Component Value [c]
Antimony	µg/g	25	Short-tailed Shrew	MECP Bird and Mammal Component Value [c]
Arsenic	µg/g	51	Short-tailed Shrew	MECP Bird and Mammal Component Value [c]
Benzene	µg/g	370	Short-tailed Shrew	MECP Bird and Mammal Component Value [c]
Benzo(a)anthracene	µg/g	1.1	Mammals	USEPA Eco-SSL [a,d]
Benzo(a)pyrene	µg/g	1600	Short-tailed Shrew	MECP Bird and Mammal Component Value [c]
Benzo(b)fluoranthene	µg/g	1.1	Mammals	USEPA Eco-SSL [a,d]
Benzo(g,h,i)perylene	µg/g	1.1	Mammals	USEPA Eco-SSL [a,d]
Benzo(k)fluoranthene	µg/g	1.1	Mammals	USEPA Eco-SSL [a,d]
Cadmium	µg/g	1.9	American Woodcock	MECP Bird and Mammal Component Value [c]
Chrysene	µg/g	1.1	Mammals	USEPA Eco-SSL [a,d]
Cobalt	µg/g	180	American Woodcock	MECP Bird and Mammal Component Value [c]
Copper	µg/g	770	Short-tailed Shrew	MECP Bird and Mammal Component Value [c]
Dibenzo(a,h)anthracene	µg/g	1.1	Mammals	USEPA Eco-SSL [a,d]
Electrical Conductivity	mS/cm	NA	--	MECP - Applicable to Plants Only [e]
Ethylbenzene	µg/g	90	Short-tailed Shrew	MECP Bird and Mammal Component Value [c]
Fluoranthene	µg/g	0.69	Short-tailed Shrew	MECP Bird and Mammal Component Value [c]
Fluorene	µg/g	100	Mammals	USEPA Eco-SSL [a,b]
Indeno(1,2,3-Cd)Pyrene	µg/g	1.1	Mammals	USEPA Eco-SSL [a,d]
Lead	µg/g	32	American Woodcock	MECP Bird and Mammal Component Value [c]
Mercury	µg/g	20	American Woodcock	MECP Bird and Mammal Component Value [c]
Molybdenum	µg/g	6.9	Short-tailed Shrew	MECP Bird and Mammal Component Value [c]
Naphthalene	µg/g	380	Short-tailed Shrew	MECP Bird and Mammal Component Value [c]
Nickel	µg/g	5000	Short-tailed Shrew	MECP Bird and Mammal Component Value [c]
PCB, Total	µg/g	1.1	American Woodcock	MECP Bird and Mammal Component Value [c]
Petroleum Hydrocarbons F2 (C10-C16)	µg/g	9800	Wildlife Soil and Food Ingestion	AEP [f]
Petroleum Hydrocarbons F3 (C16-C34)	µg/g	16000	Wildlife Soil and Food Ingestion	AEP [f]
Petroleum Hydrocarbons F4 (C34-C50)	µg/g	8400	Wildlife Soil and Food Ingestion	AEP [f]
Phenanthrene	µg/g	2700	Short-tailed Shrew	MECP Bird and Mammal Component Value [c]
Pyrene	µg/g	4700	Short-tailed Shrew	MECP Bird and Mammal Component Value [c]
Thallium	µg/g	3.9	Short-tailed Shrew	MECP Bird and Mammal Component Value [c]

Table 5-6b. Summary of Ecological Benchmark Concentrations Used in the Assessment of COCs in Soil - Birds and Mammals

Risk Assessment, 200 Beverley Street, Guelph, Ontario

COC	Units	EcoBMC - Birds and Mammals	Basis	Notes and References
Trichloroethylene	µg/g	8.1	Short-tailed Shrew	MECP Bird and Mammal Component Value [c]
Vanadium	µg/g	18	American Woodcock	MECP Bird and Mammal Component Value [c]
Xylenes, Total	µg/g	96	Short-tailed Shrew	MECP Bird and Mammal Component Value [c]
Zinc	µg/g	340	American Woodcock	MECP Bird and Mammal Component Value [c]

Source:

Ontario Ministry of the Environment, Conservation and Parks (MECP). 2011. Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act. April 15.

[a.] The proposed EPSS apply to the RA Property only.

[b.] The inferred SCS applicable to offsite properties is O. Reg. 153/04, *Table 6: Full Depth Generic Site Condition Standards for Shallow Soils in a Potable Ground Water Condition* (MECP, 2011).

[c.] Applicable only if depth to groundwater at offsite properties is less than the typical rooting depths of plants (that is, up to 1 to 1.5 mbgs).

[d.] Per Table F1-5e in Appendix F1; risks to aquatic receptors in the nearest offsite water bodies are not anticipated for this COC.

Notes:

-- = no value
µg/L = microgram(s) per litre
COC = contaminant of concern
EPSS = ecological property-specific standard
F = fraction
m = metre(s)
mbgs = metre(s) below ground surface
MECP = Ontario Ministry of the Environment, Conservation and Parks
NA = not applicable
RA = Risk Assessment
SCS = Site Condition Standards

[b.] Ontario Regulation 153/04, Table 6: Generic Site Condition Standards for Shallow Soils in a Potable Ground Water Condition for Residential Land Use with Coarse Textured Soils (MECP, 2011).
[c.] Risk management required when estimated site maximum results in risks exceeding target levels
[d.] The maximum ecological and human health risks were determined by selecting the maximum risk from all applicable pathways (that is, dermal contact, dust inhalation, outdoor air, and/or indoor air for human health; and birds and mammals, plants and soil organisms, and/or aquatic receptors for ecological health)
[e.] The dominant exposure pathway for the recommend PSS is determined by selecting the minimum risk-based concentration based on the maximum ecological and human health risks.

Grey shaded values indicate a predicted risk exceeding MECP target risk values (i.e., ILCR> 10^{-6}, HQ>0.2 or HQ>0.5 [PHCs only] for human health, HQ>1 for ecological health)
Grey Text - indicates results based on qualitative assessment.

- = no value
< = less than
> = greater than
µg/g = microgram(s) per gram
µg/L = microgram(s) per litre
Adj = adjusted
COC = contaminant of concern
Eco = ecological
F = fraction
GW = groundwater
HH = human health
ILCR = incremental lifetime cancer risk
HQ = hazard quotient
max = maximum
MECP = Ontario Ministry of the Environment, Conservation and Parks
mS/cm = milliSiemen per centimetre
NA = not applicable
ND = nondetect
PCB = polychlorinated biphenyl
PHC = petroleum hydrocarbon
PSS = Property-specific Standards
RA Property = 200 Beverley Street, Guelph, Ontario
SCS = site condition standard

Table 6-2a. Comparison of Proposed Soil PSS to Free Phase Threshold Limit

Risk Assessment, 200 Beverley Street, Guelph, Ontario

COC	Units	Maximum Concentration	Proposed PSS	Free Phase Threshold [a]

[a] Obtained from Table 4-~~43~~44 of this RA report.

[b] Obtained from Table 5-13 of this RA report.

[c] Ontario Regulation 153/04, Table 6: Generic Site Condition Standards for Shallow Soils in a Non-Potable Ground Water Condition (coarse-textured soils) (MECP, 2011).

[d] Maximum concentration observed onsite, as shown in Table 4-1.

[e] Cap Target Concentration is the minimum of the Human Health RBC, Ecological RBC, and observed maximum concentration. If the Cap Target Concentration is less than Table 6 SCS, the Table 6 SCS is selected as the Cap Target Concentration. Direct Contact and Inhalation of vapours originating from soil in the absence of RMMs have been considered in the derivation of the Cap Target Concentrations.

* Units for Electrical Conductivity are mS/cm

Notes:

µg/g = microgram per gram
COC = contaminant of concern
F = fraction
HH = human health
MECP = Ministry of the Environment, Conservation and Parks
mS/cm = milliSiemen per centimetre
RA = risk assessment
RBC = risk-based back-calculation concentration
RMM = risk management measure
SCS = site condition standard

Table 7-1. Summary of Risks for Receptors and Pathways

Risk Assessment, 200 Beverley Street, Guelph, Ontario

Pathway	Risks Predicted Above MECP Risk Targets?		Risk from NAPL? (Qualitatively Assessed)	Contaminant Class
Human Receptors				
Ingestion Exposure – Soil	✓	Composite Resident, Toddler Resident, Outdoor Worker, Utility Worker, Construction Worker	✓	PAHs, Metals, PCBs, TCE, PHC F3
Dermal Contact Exposure – Soil	✓	Composite Resident, Toddler Resident, Outdoor Worker, Utility Worker, Construction Worker	✓	PAHs, Metals, PHC F3
Dermal Contact & Ingestion – Soil	✓	Composite Resident, Toddler Resident, Outdoor Worker, Utility Worker	✓	PAHs, Metals, PCBs, TCE, PHCs
Ingestion Exposure – Groundwater	✓	Composite Resident, Toddler Resident, Pregnant Female Resident, Composite Resident, Utility Worker, Construction Worker, Pregnant Female Construction and Utility Worker	✓	PAHs, Metals, PCBs, VOCs, PHCs
Dermal Contact Exposure – Groundwater	✓	Residents, Pregnant Female Resident, Composite Resident, Utility Worker, Construction Worker, Pregnant Female Construction and Utility Worker	✓	PAHs, Metals, VOCs, PHCs
Dermal Contact & Ingestion – Groundwater	✓	Residents, Pregnant Female Resident, Composite Resident, Utility Worker, Construction Worker, Pregnant Female Construction and Utility Worker	✓	PAHs, Metals, VOCs, PHCs
Inhalation Exposure – Indoor Air Volatiles (derived from soil and groundwater) – Generic Residential Building	✓	Toddler Resident, Composite Resident, Pregnant Female Resident	✓	Benzene, PAHs, VOCs, Xylenes, PHC F1 and F2
Inhalation Exposure – Indoor Air Volatiles (derived from soil and groundwater) – Generic Commercial Building	✓	Indoor Worker, Pregnant Female Indoor Worker	✓	Benzene, Naphthalene, VOCs, PHC F1 and F2
Inhalation Exposure – Outdoor Air Volatiles above Ground Surface (derived from soil and groundwater)	×	NA	×	NA
Inhalation Exposure – Outdoor Air Volatiles within a Trench (derived from soil and groundwater)	×	Pregnant Female Construction and Utility Worker, Construction Worker	✓	Naphthalene, TCE, PHC F2
Inhalation Exposure – Outdoor Fugitive Dust (derived from soil)	✓	Pregnant Female Construction and Utility Worker, Construction Worker	×	B(a)P, Lead, Iron, Cobalt, Zinc
Ecological Receptors				
Incidental ingestion and dermal contact with COCs from the groundwater to surface water pathway	✓	Offsite Fish, Pelagic Invertebrates, and Amphibians	✓	PHC F1 and F2, Anthracene, and Zinc
Root, stem and foliar uptake of COCs from the groundwater to surface water pathway	✓	Offsite Aquatic Plants	✓	
Incidental ingestion and dermal contact with soil	✓	Soil Invertebrates	✓	PAHs, Metals, EC, and PHCs
Root uptake from soil	✓	Terrestrial Plants	✓	
Incidental ingestion of soil and food chain/dietary exposure	✓	Birds and Small Mammals	✓	PAHs, Metals, PHC F3, PCBs, TCE
Root uptake from groundwater	✓	Terrestrial Plants	✓	PAHs, PHC F1 and F2, Zinc

Notes:

✓ = Risks predicted greater than MECP Risk Targets

× = Risks predicted less than MECP Risk Targets

B(a)P = benzo[a]pyrene

COC = contaminant of concern

EC = electrical conductivity

F = fraction (petroleum)

MECP = Ontario Ministry of the Environment, Conservation and Parks

NA = not applicable

NAPL = nonaqueous phase liquid

PAH = polycyclic aromatic hydrocarbon

PCB = polychlorinated biphenyls

PHC = petroleum hydrocarbon

TCE = trichloroethylene

trans-1,2-Dichloroethene	9.70E+01	3.20E+06	NR
Trichloroethylene	4.20E+01	2.30E+00	95
Vinyl Chloride	9.90E+02	2.00E+06	NR
Xylenes, Total	4.60E+00	6.90E+03	NR

[a.] Obtained from Table 4-46 of this RA report.

Notes:

Shaded values are groundwater concentrations (that is, not soil). Units are µg/L. Risk was driven by groundwater for these COCs (with cis-1,2-dichloroethene, trans-1,2-dichloroethene, and vinyl chloride only retained as COCs in groundwater [not soil]). Soil RBCs for 2-(1-)Methylnaphthalene and PHC F2 are 1,100 µg/g and 8,300 µg/g, respectively.

µg/L = microgram per litre
COC = contaminant of concern
F = fraction
NA = not applicable
NR = reduction not required
PHC = petroleum hydrocarbon
RBC = risk-based back-calculation concentration

Table 7-3. Building Types and Applicable Vapour Mitigation Approaches

Risk Assessment, 200 Beverley Street, Guelph, Ontario

Building Type	Construction	Is the Building Foundation in Contact with Groundwater?	Vapour Mitigation Approach(es) [a,b]
New Construction	Slab-on-grade construction – occupied or constructed with vertical, below-grade foundation walls, or both	Possibly	Vapourproof barrier (and sealing of foundation penetrations, where required), and passive subslab venting system. Additional strategic placement of passive suction pit (plenum box), or vapour cut-off trench within the affected portion of the building may be used, where applicable.
	Parking garages under structures	Yes	Vapourproof and waterproof barrier; sealing of foundation penetrations; and moisture protection and passive subslab venting system.
		No	Sealing of foundation, vapourproof barrier, and passive subslab venting system.
	Other basement [c]	Yes	Passive submembrane venting layer and venting at the periphery of the foundation, vapour- and waterproof barrier, sealing of foundation penetrations; and moisture protection.
		No	Vapourproof barrier (and sealing of foundation penetrations, where required), and passive subslab venting system. Additional strategic placement of passive suction pits (or plenum boxes), or vapour cut-off trench within the affected portion of the building may be used, where applicable.
If a sump is present in the structure			Sealing, secured access, and venting to exterior of structure

[a.] Detailed design will be based on actual building type and configuration, and is required to be designed and sized appropriately by a qualified professional (for example, a P.Eng.).

[b.] Standard construction practices (that is, waterproofing versus sealing) may address the vapour intrusion management requirements. It will be the responsibility of the qualified professional to determine the acceptance of this approach.

[c.] Refers to scenarios other than parking garages.

Notes:

P.Eng. = registered Professional Engineer

Table 7-4. Summary of Capping Requirements

Risk Assessment, 200 Beverley Street, Guelph, Ontario

Application	Scenario	Type of Cap	Minimum Cap Thickness (mm)	Soil Quality Required	Frequency of Inspection
Parkland, Residential and Commercial Areas not covered by a Building Footprint	All landscaped areas (except trees)	Fill Cap	1,000 mm minimum total thickness	FCTC (reuse) or Table 6 SCS (importation)	Semi-annually (minimum)
	New trees	Fill Cap	1,500 mm to mature tree drip line or 3-metre radius from tree trunk, whichever is greater (trees species to be selected by Landscape Architect to reduce risk to mature trees due to periodic contact with shallow groundwater)		
	Hardscaping	Hard Cap	225 mm minimum total thickness; includes 75 mm hardscape (asphalt or concrete top cover or equivalent), underlain by 150 mm sub-base (Granular "A' or equivalent)		
	Buried utilities	Fill or Hard Cap	Requirements listed in this table for fill and hard cap, plus: • An additional 500 mm below the base of each new utility pipe installed below 1,000 mm • 600 mm on either side of pipes with diameters of 900 mm or less • 1,300 mm on either side of pipes with diameters greater than 900 mm		

Notes:

FCTC = fill cap target concentration

mm = millimetre

SCS = site condition standard

Table 7-5. Administrative Control Implementation

Risk Assessment, 200 Beverley Street, Guelph, Ontario

Timeframe [a]	Exposure Scenario	Administrative Controls	Specified Receptor
Current	Contact with contaminated soil at surface by unauthorized personnel	Maintain a fence surrounding the RA Property to prevent access by unauthorized personnel (that is, trespassers) or large terrestrial ecological receptors. The fence should be inspected semi-annually for deficiencies that may allow unauthorized access to the RA Property. Deficiencies should be repaired in a timely fashion. Evidence of unauthorized personnel entry should be recorded. If trespassing is noted to occur frequently, the need for upgraded fencing or security will be evaluated.	Trespassers; Large Terrestrial Mammals
Current	Animal burrowing	Maintain any existing landscaped and vegetated areas prior to redevelopment of all or portions of the RA Property.	Terrestrial Ecological Receptors
Current, Future	Contact with contaminated soil, groundwater, or NAPL during construction activities	Block exposure to contaminated soil, groundwater, or NAPL by implementing a HSP that accounts for the Site-specific conditions and prescribes the use of appropriate PPE.	Construction and Utility Workers
Current, Future	Contact with contaminated soil, groundwater, or NAPL during activities that remove soil from subsurface, relocate soil within the RA Property, or import soil for filling and grading	Reduce exposure by implementing the SGMP during construction activities that may involve breaching of the capping RMM. Implement appropriate groundwater control and treatment of groundwater entering excavations.	Construction and Utility Workers
Current, Future	Contact with soil vapours during trench excavation	Adequate air ventilation as outlined in O. Reg. 213/91, to be determined by appropriate monitoring. Mechanical ventilation may be applied, if required.	Construction and Utility Workers
Future	Release of or contact with impacted groundwater associated with foundation drains	Groundwater must be managed, treated and disposed of as per City of Guelph Sewer Use by-law	Future site users
Future	Residents in freehold dwellings; using property with no oversight or planting of community gardens	RA Property cannot be used for single family freehold dwellings that do not have oversight. Restriction on planting a vegetable garden and fruit gardens or development of allotment gardens and restriction on planting of medicinal plants except in containerized plots.	Future residential or community users
Future	Installation of well for potable or commercial use allowing direct contact with groundwater from any depth at the RA Property	Restriction on the title of the property restricting the installation of wells for potable or commercial use. Monitoring wells for testing are excepted.	Future site users

[a] Refers to stage at which the Administrative Control applies. The term "Current" refers to the RA Property in its current pre-redevelopment condition, while the term "Future" refers to redevelopment activities and post-redevelopment conditions when other RMMs will be in place as per Section 7.2.1 and 7.2.2.

Notes:

HSP = health and safety plan

NAPL = non-aqueous phase liquid

PPE = personal protective equipment

RA = risk assessment

RA Property = 200 Beverley Street, Guelph, Ontario

RMM = risk management measure

SGMP = soil and groundwater management plan

Notes:

Sampling requirements from Table 2 of Schedule E of O. Reg. 153/04.

Ontario Ministry of the Environment, Conservation and Parks (MECP). 2011a. "Records of Site Condition —Part XV.1 of the Act." Environmental Protection Act. Ontario Regulation (O. Reg.) 153/04, as amended.

[a.] Per Schedule E and formula as presented in Section 7.2.3.2

≤ = less than or equal to

> = greater than

m^3 = cubic metre(s)

Table 7-7. Selected Indoor Air Indicator Concentrations

Risk Assessment, 200 Beverley Street, Guelph, Ontario

Medium	COCs [a]	Indoor Air Risk from	Selected Indoor Air Indicator Concentration for the Generic Residential and Commercial Buildings (µg/m^3) [b,c]	
			Residential	Commercial
Air	Acenaphthene	Soil and Groundwater	1.9 [d]	6 [d]
Air	Benzene	Soil and Groundwater	0.51	1.6
Air	1,1-Dichloroethane	Groundwater	0.7	2.2
Air	1,1-Dichloroethene	Groundwater	15	50
Air	cis-1,2-Dichloroethene	Groundwater	13	43
Air	trans-1,2-Dichloroethene	Groundwater	13	43
Air	n-Hexane	Groundwater	150	500
Air	2-(1-)Methylnaphthalene	Groundwater	10 [d]	36 [d]
Air	Mercury	Soil	0.0063 [d]	0.021 [d]
Air	Naphthalene	Soil and Groundwater	0.77	2.6
Air	Tetrachloroethene	Groundwater	4.3	14
Air	1,1,1-Trichloroethane	Groundwater	210	720
Air	Trichloroethylene	Soil and Groundwater	0.27	0.4
Air	Vinyl Chloride	Groundwater	0.13	0.43
Air	Xylenes, Total	Soil	150	500
Air	PHC F1	Groundwater	2500	8500
Air	PHC F2	Soil	470	1600

[a.] COCs selected as indicators based on predicted Indoor Air risk from COCs measured in soil or groundwater (Tables 4-34a, 4-34b, 4-35a and 4-35b).

[b.] The indicator concentrations were calculated within the MECP MGRA Model (MECP, 2016) using the TRVs presented in Table 4-26. The values presented are the resulting “Health Based Indoor Air Criteria – Residential and Industrial" appearing on the “Human Health” tab of the MGRA Model.

[c.] Discussion with the MECP prior to the development and initiation of sampling program is recommended to confirm approach for COCs for which the indicator concentration cannot be achieved by commercial laboratories.

[d.] Parameter is not able to be sampled using TO-15. Alternative sampling techniques will need to be considered.

Notes:
µg/m^3 = microgram per cubic metre
COC = contaminant of concern
F = fraction
MGRA = Modified Generic Risk Assessment
MECP = Ontario Ministry of the Environment, Conservation and Parks
PHC = petroleum hydrocarbon
TRV = toxicity reference value

Table 7-8. Selected Soil Vapour Indicator Concentrations

Risk Assessment, 200 Beverley Street, Guelph, Ontario

Medium	COCs [a]	Indoor Air Risk from	Selected Soil Vapour Indicator Concentrations (µg/m^3) [b, c]	
			Residential	Commercial
Soil Vapour	Acenaphthene	Soil and Groundwater	95	1500
Soil Vapour	Benzene	Soil and Groundwater	26	400
Soil Vapour	1,1-Dichloroethane	Groundwater	35	550
Soil Vapour	1,1-Dichloroethene	Groundwater	750	13000
Soil Vapour	cis-1,2-Dichloroethene	Groundwater	650	11000
Soil Vapour	trans-1,2-Dichloroethene	Groundwater	650	11000
Soil Vapour	n-Hexane	Groundwater	7500	130000
Soil Vapour	2-(1-)Methylnaphthalene	Groundwater	500	9000
Soil Vapour	Mercury	Soil	0.32	5.3
Soil Vapour	Naphthalene	Soil and Groundwater	39	650
Soil Vapour	Tetrachloroethene	Groundwater	220	3500
Soil Vapour	1,1,1-Trichloroethane	Groundwater	11000	180000
Soil Vapour	Trichloroethylene	Soil and Groundwater	14	100
Soil Vapour	Vinyl Chloride	Groundwater	6.5	110
Soil Vapour	Xylenes, Total	Soil	7500	130000
Soil Vapour	PHC F1	Groundwater	130000	2100000
Soil Vapour	PHC F2	Soil	24000	400000

[a.] COCs selected as indicators based on predicted Indoor Air risk from COCs measured in soil or groundwater (Tables 4-34a, 4-34b, 4-35a and 4-35b).

[b.] Back-calculated from the Indoor Air Indicator Concentrations as shown in Table 7-7, using the MECP default attenuation factors of 0.02 (residential scenario) and 0.004 (commercial scenario). These indicator concentrations apply to subslab vapour data.

[c.] Discussion with the MECP prior to the development and initiation of sampling program is recommended to confirm approach for COCs for which the indicator concentration cannot be achieved by commercial laboratories.

Notes:

µg/m^3 = microgram per cubic metre

COC = contaminant of concern

F = fraction

MECP = Ontario Ministry of the Environment, Conservation and Parks

PHC = petroleum hydrocarbon

Table 7-9. Conceptual Groundwater Monitoring Program

Parameter groupings as per MECP, 2011c

Notes:

[1] - Trigger Thickness is maximum observed NAPL Thickness (2019-2020) plus 10% rounded up to nearest centimetre (cm)

~ = approximately

21 = nomenclature for proposed wells will be determined based on year of installation

COCs = contaminants of concern

F = fraction

GW = groundwater

masl = metres above sea level

mbgs = metres below ground surface

NAPL = nonaqueous phase liquid

NA = not applicable, NAPL monitoring only

PAHs = polycyclic aromatic hydrocarbons

PHC = petroleum hydrocarbons

PSS = property specific standards

VOCs = volatile organic compounds

Table 7-10. Groundwater Concentrations Used to Trigger Assessment for Contingency Measures

Risk Assessment, 200 Beverley Street, Guelph, Ontario

Ontario Ministry of the Environment, Conservation and Parks (MECP). 2011. *Rationale for the Development of Soil and Ground Water Standards for Use at Contaminated Sites in Ontario*. Prepared by Standards Development Branch. April 15.

[a] Refer to qualitative assessment of offsite risks in Section 4.4.3.2, 4,4,6 and Table 4-40 and Section 5.5.6, Table 5-12

[b] MECP Table 6 Component Value residential GW2 for coarse-textured soil (MECP, 2016).

[c] MECP GW3 Component Value; refer to Table F1-5e

[d] Refer to Table 4-44b

[e] Refer to Table 4-46, shaded values (groundwater only)

[f] MECP Table 6 Component Value GW1 (MECP, 2016).

[g] Refer to Table 7-9 for wells that TCs apply to

Notes:

Proposed TCs are the minimum water detection limit as per MECP (2011), the risk-based concentration is lower

B(a)P = benzo(a)pyrene

COC = contaminant of concern

F = fraction

GW = groundwater

GW2 = MECP component value protective of the groundwater-to-indoor air pathway.

MECP = Ontario Ministry of the Environment, Conservation and Parks

PHC = petroleum hydrocarbon

PSS = Property-specific Standard

TC = trigger concentration

NA = not applicable – pathway not assessed for COC or no potential risk above target levels indicated for offsite

Table 7-11. Financial Assurance - Vapour Intrusion Monitoring Cost

Risk Assessment, 200 Beverley Street, Guelph, Ontario

Cost Item	Baseline Monitoring (Year 1) ($)	Confirmatory Monitoring (Year 2) ($)
Sample Collection	9,600	7,500
Laboratory Analytical	18,000	14,000
Annual Sampling Port Maintenance	5,000	5,200
Annual Reporting	16,000	12,000
Contingency	9,800	7,800
Project Management	5,900	4,700
Total per Structure	**64,300**	**51,200**
Total for Site (3 Structures)	**192,900**	**153,600**
	2 Year Total^	**347,000**

Notes:

RA Property assumed to have three structures (with an approximate 600 m^2 footprint) with a passive venting vapour mitigation system. The vapour monitoring for the structure is assumed to consist of the following samples: 4 indoor air, 1 ambient (outdoor) air, and 1 duplicate (that is, a total of 6 samples per event) to be collected during four events during the first year and three events during the second year.

A 20% contingency for sample collection, laboratory costs, and annual reporting is assumed to account for potential resampling to further assess unexpected results or account for other field issues.

It is assumed that each vapour sample analysis costs $750.

A consumer price index of 3% year-over-year has been assumed.

^ = rounded up to the nearest thousand

% = percent

RA = risk assessment

m^2 = square metre(s)

Table 7-12. Financial Assurance - Groundwater Monitoring Co

Risk Assessment, 200 Beverley Street, Guelph, Ontario

Cost Item	Year 1 ($)	Year 2 ($)
Laboratory Analytical	40,000	20,600
Sample Collection and Water Disposal	20,300	10,500
Well Installation and Annual Maintenance	28,000	2,100
Reporting	30,000	18,600
Contingency	23,700	10,400
Project Management	14,200	6,300
Total	**156,200**	**68,500**
	2 Year Total^:	**225,000**

Notes:

It is assumed that each groundwater sample analysis costs $400

Assumes 22 groundwater samples plus 3 duplicate per event (25 samples total), with four events in Year 1 and two events in Year 2. It is assumed that groundwater samples are collected from all 22 wells and that free product (NAPL) monitoring (groundwater level monitoring) will also be completed in each well to confirm the groundwater gradient and to check for the presence or absence of NAPL product in the wells.

Based on installation of four new wells; it is assumed that the well depths will range between 1.5 and 11 metres below ground surface.

A 20 percent contingency for sample collection, laboratory costs, and annual reporting is assumed to account for potential resampling to further assess unexpected results or account for other field issues and potential maintenance of wells.

A consumer price index of 3% year-over-year has been assumed.

^ - rounded up to the nearest thousand

Table 8-1. Summary of Public Comments Received at Public Information Meetings

Risk Assessment, 200 Beverley Street, Guelph, Ontario

Comment No.	Comment	Response
Developers Open House, January 23, 2018		
1	Can we have an example of how contaminants would be managed onsite?	Identified Risk Management Measure – prevents a contaminant from having an effect on environment; for example, if the parameter of concern is an issue for plants; a site gets paved and prevents plant growth
2	At the corner of Alice and Stevenson, there is a little business with pipes– do they have anything to do with the IMICO cleanup?	That is a privately owned site, and private remediation is ongoing. (The owner of the site was in the audience and additionally responded that he owned for 20 years; main contaminant is toluene. The site monitoring has been occurring from before he owned it. They have "put bugs down there", some chemicals, only remaining contamination is a small corner which is "not going anywhere". BP – bought Foseco and has been paying these costs.)
3	With reference to the contaminant figures, they show a significant amount of the site is impacted. How much of the 13 acres is developable?	All of it is developable, just a matter of managing contaminants. Under the current regulatory regime, many industrial properties are fully developable.
4	With respect to the discussion on the difference between clean and managed – will the decision for what is to be cleaned up and what is to be managed depend on the development plan?	Yes. The decisions will depend on cost considerations if things start getting expensive. Management and clean up will be rationalized with the development plan.
5	What happens at the edge of the property (with respect to delineation)?	We stop looking; project ends at the property boundary.
6	If a chemical gets into the groundwater, does it move throughout the city?	Contaminants do move with groundwater; however, many mechanisms come into play. As it moves, it dilutes. Other contaminants retard through soil adsorption, or stop migrating.
7	When dealing with zinc and managing in place, does it then have the potential to move to groundwater? How do you ensure the contaminants in place don't affect the groundwater?	You change characterization of the site. Soil caps change the amount of infiltration from such things as rain water. The MOE regulations are such that it ensures it does not further contaminate.
8	With respect to the mechanisms for managing on site – with the COCs we've seen, is there more natural treatment methods?	Yes, phytoremediation, bio treatments – usually these involve long term monitoring; generally for short term development they are not preferred due to timelines.
9	Does IMICO compare to other projects worked on, and timelines?	The Site is not exceptional, from our perspective, by end of year we should be looking at options and remediation.

Note:

1. For Developer's meeting(s), only comments relavent to the environmental site assessment, manamgement and schedule have been recorded.

LEGEND

- Complete pathway
- Pathway/receptor present
- No receptor present or incomplete pathway
- Pathway will be considered qualitatively based on quantitative results of a surrogate receptor

BTEX = benzene, toluene, ethylbenzene, xylenes
COC = contaminant of concern
NAPL = nonaqueous phase liquid
PAH = polycyclic aromatic hydrocarbon
PCB = polychlorinated biphenyl
PHC = petroleum hydrocarbon
RMM = risk management measure
VOC = volatile organic compound

Notes:
* As part of the Phase Two ESA investigation, measurable NAPL (associated with PHCs) was present in three monitoring wells in the eastern portion of the Site.
a. Site Visitors from all age categories would be anticipated to frequent the Site.
b. Surface Receptor incorporates offsite surface receptors (that is, receptors not engaged in subsurface excavation activities), such as indoor workers, residents, visitors, outdoor workers, or patrons of nearby properties that may be exposed to dust (soil particulates) or groundwater migrating offsite during the redevelopment of the property in the absence of RMMs.
c. Outdoor air inhalation includes both ambient and trench air inhalation, as appropriate.
d. Dermal exposure to vapours is a negligible pathway and will not be considered quantitatively.
e. There is high uncertainty associated with assessing the potential exposure to site COCs through ingestion of garden produce; therefore, this pathway will not be considered quantitatively.
f. As groundwater at the Site is potable, the ingestion of groundwater pathway includes both incidental ingestion (as a result of subsurface activities) and ingestion of water from the municipal water supply

Appendix A
Pre-submission Form (PSF) and Response to Comments

Appendix A1
Pre-submission Form

Risk Assessment Pre-Submission Form
200 Beverley Street, Guelph, Ontario

Prepared for

City of Guelph

February 2019

CH2M HILL Canada Limited
72 Victoria Street South, Suite 300
Kitchener, ON
N2G 4Y9

Ontario

Ministry of the Environment and Climate Change

Risk Assessment Pre-submission

Ministry Use Only		
Reference Number	Date (yyyy/mm/dd)	Initials

General Information and Instructions

- Submit the completed form to: The Director
  Environmental Approvals Access and Service Integration Branch
  Ontario Ministry of the Environment and Climate Change
  135 St Clair Ave W, 1st Floor
  Toronto ON M4V 1P5
- Questions and inquiries: Call 416-314-8001
- In order for this form to be considered complete, all relevant sections must be completed and it must be accompanied by the required supporting documents (please see Important Note below).
- Sections A and B must be signed.
- **Forms that are incomplete will be returned without comment.**

Important Note to Property Owners and their Qualified Persons

Preparing and submitting the Risk Assessment Pre-submission form (PSF) is a mandatory part of the risk assessment review process. The PSF is an opportunity for the property owner and their Qualified Person to provide a thorough description of the property and of the planned risk assessment approach, and for the Ministry to provide comments in return. When used effectively, the PSF can improve the quality of the risk assessment (RA) submission, enabling a more efficient Ministry review.

The PSF must be filled out completely and accurately for it to be reviewed by the ministry. Critical supporting documents that must accompany the PSF include:

- A Conceptual Site Model that meets the requirements of O. Reg. 153/04, Schedule C, section 3. Please carefully review completeness checklist included in Section 7 of this form.
- Human Health Conceptual Site Model and Ecological Conceptual Site Model (with and without risk management measures (RMMs) in place).

It is very important for property owners and Qualified Persons to know that if the Conceptual Site Model submitted with this form does not meet all of the requirements specified in O. Reg. 153/04, Schedule C, Section 3, the PSF will not be considered complete and review will not be initiated by the Ministry.

Notice of Collection of Personal Information

Personal information is collected under the authority of Part XV.1 of the *Environmental Protection Act*, R.S.O. 1990, c. E-19, as amended (EPA). Personal information will be used to identify current and previous owner(s) of the risk assessment property. Questions about the collection of personal information should be directed to the Director, Environmental Approvals Access and Service Integration Branch, Ministry of the Environment and Climate Change, 135 St. Clair Avenue West, 1st Floor, Toronto ON M4V 1P5, 416-314-8001.

Note: Comments provided by the Ministry of the Environment and Climate Change (Ministry) on the content of this PSF are not in any way a Director's response to a risk assessment referred to in section 168.5 of the EPA.

It is an offence under subsection 184 (2) of the EPA for a person to give or submit false or misleading information in any statement, document or data to any provincial officer, the Minister, the Ministry, any employee or agent of the Ministry, or any person involved in carrying out a program of the Ministry in respect of any matter related to the EPA or a regulation under the EPA.

Information contained in this form is not considered confidential and will be made available to the public upon request. Information submitted with this form as supporting information may be marked confidential but will be subject to the *Freedom of Information and Protection of Privacy Act*, R.S.O. 1990, c. F.31. If you do not mark supporting information as confidential at the time of submitting the information, the Ministry may make the supporting information available to the public without further notice to you.

Record Information

Has a previous PSF been filed for this property?

☐ Yes ☑ No If yes, provide the PSF/RA reference number ►

Is it intended that a Record of Site Condition be filed for this property?

☑ Yes ☐ No

Is a Record of Site Condition required for this property because of a planned change to a more sensitive land use?

☑ Yes ☐ No ☐ Other (specify) ►

A. Statement of Qualified Person

Note: It is an offence to submit false or misleading information.

I, the undersigned hereby declare that, to the best of my knowledge, the information contained herein and the information submitted in support of this form is complete and accurate in every way and that I meet the applicable qualifications of a Qualified Person for risk assessments as set out in O. Reg. 153/04 for the purpose of preparing the PSF undertaking or supervising the risk assessment work and preparing the subsequent RA Report and that the required documents as indicated below are attached.

Have your qualifications been approved as a result of a previous submitted PSF?

☐ Yes ☑ No If no, specify details below ▼

Resume attached?	Work references attached?	University transcripts attached?
☑ Yes ☐ No	☑ Yes ☐ No	☑ Yes ☐ No

I do not hold and have not held a direct or indirect interest in the Risk Assessment property or any property which includes the Risk Assessment property and was the subject of the phase one or two environmental site assessment upon which the Risk Assessment is based.

☑ Yes ☐ No

(Print) Name (Last name, first name)	Signature	Date (yyyy/mm/dd)

2. Planned Risk Assessment Approach (determines timelines for review)

Select appropriate approach

☐ Limited Scope Risk Assessment O. Reg. 153/04 Schedule C, section 7
Reason for limited scope
- ☐ Modified Generic Risk Assessment (Tier 2)
- ☐ Risk Assessment using a community assessment report

☐ New Science risk assessment O. Reg. 153/04 Schedule C, section 9
- ☐ Proposed new toxicity data
- ☐ Probabilistic model (specify details below) ▼
- ☐ New model (specify details below) ▼

Name of new model used?

Are any new models used proprietary?
☐ Yes ☐ No

☐ Estimation of local background concentration O. Reg. 153/04 Schedule C, Section 8. Omit section 4, 5 and 7.
☐ Wider area of Abatement O. Reg. 153/04 Schedule C, section 10
☑ A Risk Assessment other than those identified in O. Reg. 153/04 Schedule C, Part II

Identify the computer models to be used in the preparation of the Risk Assessment

☐ Modified generic Risk Assessment approved model (Ministry of Environment and Climate Change)

Date (yyyy/mm/dd) ►

☑ Other (specify) ▼

1. USEPA (2004) Johnson and Ettinger Model
2. MECP (November 2016) MGRA Approved Model
3.
4.
5.
6.
7.

3. Site Information

3.1 Site Use Information (Information about current, proposed, and historical property use for the site)

Year	Name of Owner (Last Name, First Name)	Description of Property Use(s)	Property Use(s) (per regulatory types)	Other Observations from Aerial Photographs, Fire Insurance Plans, etc.
1997	City of Guelph	Vacant	Industrial	Aerials show the Site buildings demolished between 1998 and 2006 and the Site vacant thereafter
1993	The Assembly of the Church of the Universe	Unknown	Institutional/ Industrial	Aerials during this time show damage (assumed from fires) to the buildings on Site
1992	John H. Long	Storage	Industrial	No additional information available for this time period
1913	International Malleable Iron Company Limited	Iron-jobbing Foundry	Industrial	Aerials, FIPs show industrial use through this time period; previous reports indicate operations ceased in 1989
1834	Various	Agricultural or residential	Agricultural or residential	Private individuals were listed in the Title Search; no aerials were available before 1930, and no FIP coverage was available for the area prior to 1916

3.2 Adjacent Property Use Information (Information about current property use for the adjacent property)

Description of Property Use(s)	Property Use(s) (per regulatory types)	Other Observations from Aerial Photographs, Fire Insurance Plans, etc.	Does property receive surface water run-off from the Risk Assessment property?	Does ground water from Risk Assessment property flow?
North of the Site: rail use, manufacturing, mixed business, and residential	Industrial, commercial, residential	Rail lines present on aerial photographs dating back to 1930. Outdoor storage visible on 1990 aerial photograph. Spur lines and rail car storage visible on 2006 aerial photograph	No	Up-gradient
East of the Site: manufacturing, mixed office, mixed business, residential	Industrial, commercial, residential	Residential land evident on 1930 aerial photograph. Industrial development evident on 1964 aerial photograph.	No	Cross-gradient

South of the Site: manufacturing, mixed office, mixed business, residential	Industrial, commercial, residential	1930 aerial photograph shows a mix of undeveloped and residential land. Industrial development evident on 1964 aerial photograph.	No	Down-gradient
West of the Site: residential	Residential	1930 aerial photograph shows a mix of undeveloped and residential land. Industrial development evident on 1964 aerial photograph.	No	Cross-gradient

3.3 Additional Project Information

3.3.1 Has municipality been notified of non-potable ground water? . . . . . ☐ Yes ☑ No

If yes, attach notification

3.3.2 Has municipality responded? . . . . . ☐ Yes ☐ No ☑ Not applicable

If yes, specify location of response

Please provide a copy of the response.

3.3.3 Flow through of contaminated ground water? . . . . . ☐ Yes ☐ No ☑ Not determined

3.3.4 Are there ongoing industrial/commercial operations on the property? . . . ☐ Yes ☑ No

3.3.5 Are there structures currently on the property? . . . . . ☐ Yes ☑ No

3.3.6 Have buildings/structures on the property been demolished? . . . . . ☑ Yes ☐ No

3.3.7 Has any remedial action taken place on the property? . . . . . ☑ Yes ☐ No

3.3.8 Has the contaminant source been removed from the property? . . . . . ☐ Yes ☐ No ☑ Not determined

3.3.9 Has free phase product (non-aqueous phase liquid (NAPL) / dense non-aqueous phase liquid (DNAPL)) been visually observed or documented via an interface probe on the site? . . . . . ☑ Yes ☐ No

If yes, state maximum reported thickness or other evidence

Light non-aqueous phase liquid: 39 centimeters (OW23S)

3.3.10 Do chemical analysis results for soil or ground water indicate the potential for, or likelihood of free phase product within ground water based on solubility concentrations or saturated soil conditions on the site?

Ground water . . . . . ☑ Yes ☐ No

Soil . . . . . ☑ Yes ☐ No

3.3.11 Depth of organic contamination in soil 0 to 2.89 m ☐ Not applicable

3.3.12 Depth of inorganic contamination in soil 0 to 3.2 m ☐ Not applicable

3.3.13 On site contamination source . . . . . ☑ Yes ☐ No ☐ Not determined

3.3.14 Off site contamination source . . . . . ☑ Yes ☐ No ☐ Not determined

3.3.15 Based on the Conceptual Site Model and the identified potential pathways/routes of contaminants to receptors, have all pathways/routes been assessed in the Phase 1 and Phase 2 environmental site assessment (ESAs)? . . . . . ☑ Yes ☐ No

If no, is additional site characterization planned prior to submission of Risk Assessment? . . . . . ☐ Yes ☐ No

3.4 Sampling Summary

Media sampled as part of Phase 2 ESA requirements for filing a Record of Site Condition

	Media	Was This Medium Sampled?	Year of Most Recent Sample Collection
3.4.1	Surface soil (up to 1.5 metres)	☑ Yes ☐ No	2018
3.4.2	Subsurface soil (greater than 1.5 metres)	☑ Yes ☐ No	2018
3.4.3	Ground water	☑ Yes ☐ No	2018
3.4.4	Soil vapour/sub slab	☐ Yes ☑ No	
3.4.5	Sediment	☐ Yes ☑ No	
3.4.6	Surface water	☐ Yes ☑ No	
3.4.7	Indoor air	☐ Yes ☑ No	
3.4.8	Outdoor air	☐ Yes ☑ No	
3.4.9.		☐ Yes ☑ No	

3.5 Selection of Applicable Site Condition Standards

3.5.1 Is property within an area of natural significance? . . . . . ☐ Yes ☑ No

3.5.2 Does property:

- include or is adjacent to an area of natural significance? . . . . . ☐ Yes ☑ No
- include land that is within 30 metres of an area of natural significance? ☐ Yes ☑ No

3.5.3 Soil at the property has:

- pH value for surface soil less than 5 or greater than 9? . . . . . ☑ Yes ☐ No
- pH value for subsurface soil less than 5 or greater than 11? . . . . . ☐ Yes ☑ No

3.5.4 Is the property a shallow soil property? . . . . . ☑ Yes ☐ No

3.5.5 Does the property include or is the property adjacent to a water body or does it include land that is within 30 metres of a water body? . . . . . ☐ Yes ☑ No

3.5.6 What is the ground water condition for the property? . . . . . ☑ Potable ☐ Non-potable

3.5.7 What is the texture of the soil? . . . . . ☑ Coarse ☐ Medium or fine

If medium or fine, attach grain size analysis and rationale

3.5.8 What is the Assessment/Restoration approach? . . . ☐ Background ☑ Full-depth generic ☐ Stratified

3.5.9 What is the intended use of the property?

☐ Agricultural/Other ☑ Commercial ☑ Community ☐ Industrial

☐ Institutional ☑ Parkland ☑ Residential

3.6 Contaminant Inventory for the Media

Surface Soil (up to 1.5 metres) (Complete if using stratified approach)

Surface soil applicable

- ☐ Yes
- ☑ No

Soil pH Measured ☐ Not determined

Minimum

Maximum

Number of samples

Soil texture

- ☐ Coarse
- ☐ Medium or fine ►
- ☐ Not determined

If medium or fine, specify grain size analysis, figure showing grain size sampling locations and rationale for soil texture

Contaminant inventory for surface soil

Note: If there is a contaminant not listed under the drop down menu, enter the chemical information and its contaminant identifier directly into the fields.

Contaminant	Contaminant Identifier	Maximum Measured Concentration	Units	Minimum Detection Limit (MDL)	Applicable Site Condition Standard (SCS)	Potential for Exceedance of Applicable SCSs at Nearest Off-site Receptors?	Retained as a Contaminant for Risk Assessment?
See Full Depth Soil						☐ Yes ☐ No	☐ Yes ☐ No

Subsurface Soil (greater than 1.5 metres) (Complete if using stratified approach)

Subsurface soil applicable

- ☐ Yes
- ☑ No

Soil pH Measured ☐ Not determined

Minimum

Maximum

Number of samples

Soil texture

- ☐ Coarse
- ☐ Medium or fine ►
- ☐ Not determined

If medium or fine, specify grain size analysis, figure showing grain size sampling locations and rationale for soil texture

Contaminant inventory for subsurface soil

Note: If there is a contaminant not listed under the drop down menu, enter the chemical information and its contaminant identifier directly into the fields.

Contaminant	Contaminant Identifier	Maximum Measured Concentration	Units	Minimum Detection Limit (MDL)	Applicable Site Condition Standard (SCS)	Potential for Exceedance of Applicable SCSs at Nearest Off-site Receptors?	Retained as a Contaminant for Risk Assessment?
See Full Depth Soil						☐ Yes ☐ No	☐ Yes ☐ No

Full Depth Soil

Full depth soil applicable

- ☑ Yes
- ☐ No

Soil pH Measured ☐ Not determined

Minimum 6.6

Maximum 9.45

Number of samples 91

Soil texture

- ☑ Coarse
- ☐ Medium or fine ►
- ☐ Not determined

If medium or fine, specify grain size analysis, figure showing grain size sampling locations and rationale for soil texture

Contaminant inventory for full depth soil

Note: If there is a contaminant not listed under the drop down menu, enter the chemical information and its contaminant identifier directly into the fields.

Contaminant	Contaminant Identifier	Maximum Measured Concentration	Units	Minimum Detection Limit (MDL)	Applicable Site Condition Standard (SCS)	Potential for Exceedance of Applicable SCSs at Nearest Off-site Receptors?	Retained as a Contaminant for Risk Assessment?
See Table D-1 in Attachment D						☐ Yes ☐ No	☐ Yes ☐ No

Ground Water

Ground water applicable	How many ground water units are present to the depth of concern on the site?	Minimum depth to water table (in metres)
☑ Yes ☐ No	3, data for all units pooled for Risk Assessment	0.93

Is more than one aquifer impacted?	☑ Yes	☐ No	☐ Not determined
Vertical delineation for the Risk Assessment property shown on conceptual site model (CSM) cross-sectional figures?	☑ Yes	☐ No	
Lateral delineation for the Risk Assessment property shown on CSM plan view and cross-sectional figures?	☑ Yes	☐ No	
Does the plume extend off site?	☐ Yes	☐ No	☑ Not determined

Aquifer hydraulic conductivity (in metres per second)		Aquifer horizontal gradient (in metres per metres)	
2.4 x 10^-5	☐ Not determined	0.006 to 0.027	☐ Not determined

Contaminant inventory for ground water

Note: If there is a contaminant not listed under the drop down menu, enter the chemical information and its contaminant identifier directly into the fields.

Contaminant	Contaminant Identifier	Maximum Measured Concentration	Units	Minimum Detection Limit (MDL)	Applicable Site Condition Standard (SCS)	Potential for Exceedance of Applicable SCSs at Nearest Off-site Receptors?	Retained as a Contaminant for Risk Assessment?
See Table D-2 in Attachment D						☐ Yes ☐ No	☐ Yes ☐ No

Sediment

Sediment applicable ☐ Yes ☑ No

Contaminant inventory for sediment

Note: If there is a contaminant not listed under the drop down menu, enter the chemical information and its contaminant identifier directly into the fields.

Contaminant	Contaminant Identifier	Maximum Measured Concentration	Units	Minimum Detection Limit (MDL)	Applicable Site Condition Standard (SCS)	Potential for Exceedance of Applicable SCSs at Nearest Off-site Receptors?	Retained as a Contaminant for Risk Assessment?
						☐ Yes ☐ No	☐ Yes ☐ No

Vapour

Soil vapour applicable	Sub-slab vapour applicable	Indoor air applicable	Outdoor air applicable
☐ Yes ☑ No	☐ Yes ☐ No	☐ Yes ☐ No	☐ Yes ☐ No

Contaminant inventory for vapour

Note: If there is a contaminant not listed under the drop down menu, enter the chemical information and its contaminant identifier directly into the fields.

Contaminant	Contaminant Identifier	Maximum Concentration (include unit of measure)	Number of Sample Locations	Number of Samples Analysed	Analytical Method	Minimum Detection Limit (MDL)	Maximum Detection Limit Unit (MDLU)

Other

Other applicable	If yes, specify
☐ Yes ☑ No

Valued Ecological Components

☐ If Modified Generic Risk Assessment, the site specific Valued Ecological Components list is consistent with the list in the Approved Model.

Valued Ecological Components	List of Studied Species
Terrestrial Vegetation	
Crops	Not applicable
Trees/Shrubs	Limited quantities. To be represented by Manitoba Maple Trees.
Herbaceous	Limited quantities. To be represented by grasses.
Terrestrial Animals	
Invertebrates	Soil invertebrate community (for example, earthworms).
Mammals	To be represented by meadow vole, red fox, and short-tailed shrew.
Mammals with breeding habitat	To be represented by meadow vole, red fox, and short-tailed shrew.
Avian species	To be represented by the American Woodcock, Red-tailed Hawk, and Red-winged Blackbird.
Avian species with breeding habitat	To be represented by the American Woodcock, Red-tailed Hawk, and Red-winged Blackbird.
Reptiles/Amphibians	Various. Possible snakes (Eastern garter snakes).
Reptiles/Amphibians with breeding habitat	Various. Possible snakes (Eastern garter snakes).
Aquatic Vegetation	
Aquatic plant species	To be represented by sedges (Carex sp).
Trees/Shrubs/Bog plants	To be represented by sedges (Carex sp).
Aquatic Animals	

Valued Ecological Components	List of Studied Species
Invertebrates (water column)	To be represented by daphnia.
Invertebrates (benthic)	Not applicable.
Molluscs	Not applicable.
Amphibians	To be represented by Green Frog.
Amphibians with breeding habitat	To be represented by Green Frog.
Fish	To be represented by Common Shiner and Northern Pike.
Fish with spawning habitat	To be represented by Common Shiner and Northern Pike.

7. Conceptual Site Model (Schedule C, Subsection 3 (8) of O. Reg. 153/04)

Each regulatory requirement listed below must be met. It is recommended that the Conceptual Site Model follow the order below.

Subsection Reference No.	Description	Yes	Not Applicable
3 (8)	The pre-submission form must include information on the proposed conceptual site model that the qualified person intends to rely upon in the preparation of the parts of the Risk Assessment (RA) report described in Report Section 3, Report Section 4 and Report Section 5 of Table 1 of this Schedule including,		
3 (8)(a)	a description and assessment of,	☑	☐
3 (8)(a)(i)	areas of potential environmental concern, and	☑	☐
3 (8)(a)(ii)	any subsurface structures and utilities on, in or under the RA property that may affect contaminant distribution and transport;	☑	☐
3 (8)(a.1)	a description of and, as appropriate, figures illustrating, the physical setting of a RA property and any areas under it including,	☑	☐
3 (8)(a.1)(i)	stratigraphy from ground surface to the deepest aquifer or aquitard investigated,	☑	☐
3 (8)(a.1)(ii)	hydrogeological characteristics, including aquifers, aquitards and, in each hydrostratigraphic unit where one or more contaminants is present at concentrations above the applicable site condition standards, lateral and vertical hydraulic gradients,	☑	☐
3 (8)(a.1)(iii)	approximate depth to bedrock,	☑	☐
3 (8)(a.1)(iv)	approximate depth to water table,	☑	☐
3 (8)(a.1)(v)	any respect in which section 41 or 43.1 of the regulation applies to the property,	☑	☐
3 (8)(a.1)(vi)	areas where soil has been brought from another property and placed on, in or under the RA property, and	☑	☐
3 (8)(a.1)(vii)	approximate locations, if known, of any proposed buildings and other structures;	☑	☐
3 (8)(a.2)	where a contaminant is present on, in or under a RA property at a concentration greater than the applicable site condition standard, identification of,	☑	☐

Subsection Reference No.	Description	Yes	Not Applicable
3 (8)(a.2)(i)	each area where a contaminant is present on, in or under a RA property at a concentration greater than the applicable site condition standard,	☑	☐
3 (8)(a.2)(ii)	the contaminants associated with each of the areas referred to in subclause (i), and	☑	☐
3 (8)(a.2)(iii)	each medium in which a contaminant associated with an area referred to in subclause (i) above is present;	☑	☐
3 (8)(a.3)	where a contaminant is present on, in or under a RA property at a concentration greater than the applicable site condition standard, a description of,	☑	☐
3 (8)(a.3)(i)	what is known about each of the areas referred to in subclause (a.2) (i),	☑	☐
3 (8)(a.3)(ii)	the distribution, in each of the areas referred to in subclause (a.2) (i), of each contaminant present in the area at a concentration greater than the applicable site condition standard, for each medium in which the contaminant is present, together with figures showing the distribution,	☑	☐
3 (8)(a.3)(iii)	anything known about the reason for the discharge into the natural environment of the contaminants present on, in or under the RA property at a concentration greater than the applicable site condition standard,	☑	☐
3 (8)(a.3)(iv)	anything known about migration away from any area of potential environmental concern of the contaminants present on, in or under the RA property at a concentration greater than the applicable site condition standard, including the identification of any preferential pathways,	☑	☐
3 (8)(a.3)(v)	climatic or meteorological conditions that may have influenced distribution and migration of the contaminants, such as temporal fluctuations in ground water levels, and	☑	☐
3 (8)(a.3)(vi)	if applicable, information concerning soil vapour intrusion of the contaminants into buildings including,	☐	☑
3 (8)(a.3)(vi)(A)	relevant construction features of a building, such as a basement or crawl space,	☐	☑
3 (8)(a.3)(vi)(B)	building heating, ventilating and air conditioning design and operation, and	☐	☑
3 (8)(a.3)(vi)(C)	Subsurface utilities;	☐	☑
3 (8)(a.4)	where contaminants on, in or under the RA property are present at concentrations greater than the applicable site condition standard, one or more cross-sections showing,	☑	☐
3 (8)(a.4)(i)	the lateral and vertical distribution of a contaminant in each area where the contaminant is present at a concentration greater than the applicable site condition standard in soil, ground water and sediment,	☑	☐
3 (8)(a.4)(ii)	approximate depth to water table in each area referred to in subclause (i),	☑	☐
3 (8)(a.4)(iii)	stratigraphy from ground surface to the deepest aquifer or aquitard investigated, and	☑	☐
3 (8)(a.4)(iv)	any subsurface structures and utilities that may affect contaminant distribution and transport in each area referred to in subclause (i);	☐	☑
3 (8)(b)	for each area where a contaminant is present on, in or under the RA property at a concentration greater than the applicable site condition standard for the contaminant, a diagram identifying, with narrative explanatory notes,	☑	☐
3 (8)(b)(i)	the release mechanisms,	☑	☐
3 (8)(b)(ii)	contaminant transport pathway,	☑	☐
3 (8)(b)(iii)	the human and ecological receptors located on, in, under and off the RA property,	☑	☐
3 (8)(b)(iv)	receptor exposure points, and	☑	☐

Subsection Reference No.	Description	Yes	Not Applicable
3 (8)(b)(v)	routes of exposure;	☑	☐
3 (8)(c)	with explanatory notes, showing the biota and food web relationships on and off the RA property which may be affected by contaminants on, in or under the RA property.	☑	☐

11. Modified Generic Risk Assessment (MGRA) Approved Model

This section to be completed only if intending to submit MGRA in respect of the Risk Assessment property.

☐ **Pathway Modifier: Modify Solubility Component Values (for Petroleum Hydrocarbons (PHC) F1 and PHC F2)**

1) Was ground water collected for PHC analysis using a low-flow sampling method? . . . . . ☐ Yes ☐ No

2) Was ground water collected for PHC analysis no more than 30 cm below the water table? . . . . ☐ Yes ☐ No

3) Has groundwater flow direction been determined based on the minimum requirements for ground water sampling (with respect to monitoring frequency) set out in Schedule E, Table 4, Assumption Category 4? . . . . . ☐ Yes ☐ No

4) If the contaminant source of the PHC exceedance has not been removed from the Risk Assessment property, how far apart were the monitoring wells used to delineate PHC F1 and/or F2?

☐ **Risk management measure: no ground water use**

Note: "Well" marked with an asterisk (*) in this measure, is defined in subsection 35 (1) of the Regulation. It does not include holes such as:

- a hole solely intended to test or to obtain information in respect of groundwater or an aquifer, or
- a hole solely made to lower or control the level of groundwater in the area of the hole or to remove material that may be in the groundwater.

This risk management measure applies only to wells as defined in subsection 35 (1).

1a) Is the GW1 (drinking water component value) component value (i.e., Ontario Drinking Water Quality Standard) met down-gradient of all known exceedances of the applicable generic standard at the Risk Assessment property? . . . . . ☐ Yes ☐ No

1b) Will the GW1 component value likely be met at the nearest off-site human receptors? . . . . . ☐ Yes ☐ No

1c) Are there any water well* records within a radius of 250 metres from the boundary of the Risk Assessment property, as identified in the phase 1 environmental site assessment report? . . . . ☐ Yes ☐ No

1d) Have you carried out any other activities to identify other potable wells* not captured by water well records? . . . . . ☐ Yes ☐ No

If yes, does the information identify other potable wells not captured by water well records? . . . ☐ Yes ☐ No

2) Are the Risk Assessment property and all other properties located, in whole or in part, within 250 metres of the boundaries of the Risk Assessment property, supplied by a municipal drinking water system, as defined in the *Safe Drinking Water Act, 2002*? . . . . . ☐ Yes ☐ No

3a) Is the Risk Assessment property in, or within, 250 m any of the following, as set out in the Assessment Report portion of the applicable Source Protection Plan under the *Clean Water Act, 2006* (as per source water protection mapping available through local Conservation Authorities):

Note: For definitions, see the *Clean Water Act, 2006*

- A designated well head protection area (WHPA) . . . . . ☐ Yes ☐ No

  If yes, identify the WHPA classification (A through F) **and** aquifer vulnerability score

  _____

- A significant groundwater recharge area (SGRA) . . . . . ☐ Yes ☐ No
- A highly vulnerable aquifer (HVA) . . . . . ☐ Yes ☐ No
- An issues contributing area (ICA) . . . . . ☐ Yes ☐ No
- A Source Water Intake Protection Zone (IPZ) . . . . . ☐ Yes ☐ No

3b) Have you attached a map showing the Risk Assessment property in relation any Source Water Protection Areas identified above? . . . . . ☐ Yes ☐ No

4) Have you consulted with the appropriate Ministry District Office on the proposal to use the "No Ground Water Use risk management measure" at the Risk Assessment property?. . . . . ☐ Yes ☐ No

Note: One of the outcomes of the Ministry's detailed review of the RA may still be the conclusion that ground water monitoring is warranted for the Risk Assessment property, and, therefore, the Risk Assessment cannot be classified as an Modified Generic Risk Assessment.

5a) Has the Municipality been notified that the Risk Assessment assumes that the ground water under the Risk Assessment property does not or will not serve as a raw water supply for a drinking water system, in accordance with Schedule C, subsection 4(5)? . . . . . ☐ Yes ☐ No

Location of notification

_____ Please attach the notification.

5b) Has Municipality responded? . . . . . ☐ Yes ☐ No

If yes, provide response

_____

Location of response

_____

☐ **Any pathway modifier or risk management measure that modifies the GW2 (the protection of indoor air from vapours originating from groundwater component) component value**

- ☐ Building with storage garage
- ☐ Building prohibition
- ☐ Building with no first storey residential use

☐ Soil vapour intrusion mitigation system

☐ Soil vapour screening level met for ground water source

☐ Building with minimum first storey ceiling height requirement

1) Will the applicable full depth site condition standards likely be met at the nearest off-site human receptors? . . . . . ☐ Yes ☐ No

2) Have you consulted with the appropriate Ministry of the Environment and Climate Change District Office regarding your assessment of the likelihood for vapour intrusion to occur off-site? . . . . . ☐ Yes ☐ No

☐ **Modified Subsurface Worker Protection (where the S3 pathway is modified for an inorganic chemicals of concern (COC)**

1) Did you do leachate testing for inorganics? . . . . . ☐ Yes ☐ No

If yes, what leachate test did you use?

☐ Synthetic Precipitation Leaching Procedure (SPLP)

☐ Toxicity Characteristic Leaching Procedure (TCLP)

2) Did the results meet the values generated by the Approved Model? ["Tier 2 Input" tab, Cell A61-C66] . . . . . ☐ Yes ☐ No

Attachment A
Phase One and Two ESA Summaries

Attachment A1
Phase One ESA Summary

ATTACHMENT A1

CH2M HILL Phase One Environmental Site Assessment Summary

This attachment summarizes the results and conclusions of the CH2M HILL Canada Limited (CH2M) Draft Phase One Environmental Site Assessment (ESA) document entitled *Phase One Environmental Site Assessment, Former International Malleable Iron Company, 200 Beverley Street, Guelph, Ontario*, dated August 18, 2017 (CH2M, 2017).

City of Guelph (City) retained CH2M to complete a Phase One ESA in 2017 for the property identified as the former International Malleable Iron Company (IMICO) foundry facility, located at 200 Beverley Street in Guelph, Ontario (Site). The Site is approximately 5.2 hectares in size and is located east of the City's downtown. It is CH2M's understanding that the Phase One ESA has been requested in support of the potential redevelopment of the Site from an industrial use, to residential/ parkland/ institutional land use purposes. This change in land use required a Record of Site Condition (RSC). The Site and the Phase One Study Area (defined as lands located within 250 metres [m] of the Site) are shown on Figures 2-1 and 2-2. The Phase One Study Area was expanded beyond 250 m from the Site (as shown on Figure 2-1) to include the following land:

i) To the north to include entire industrial and commercial properties located on Elizabeth Street and Victoria Road South;

ii) To the east to include entire industrial and commercial properties located along Victoria Road South and York Road; and

iii) To the south to include entire properties which appear to be former industrial and commercial properties located along the east side of Morris Street and north side of York Road.

The purpose of the Phase One ESA was to assess the Site and the Phase One Study Area in accordance with the defined terms of Ontario Regulation (O.Reg.) 153/04, as amended, for potentially contaminating activities (PCAs) to identify areas of potential environmental concern (APECs). To accomplish these goals, CH2M used a combination of activities, (such as records review, site visits, and interviews) to identify areas on or near the Phase One Property that may warrant further investigation. The Phase One ESA included the following components:

- Records review
- Interviews
- Site reconnaissance
- Evaluation of the information gathered from the records review, interviews, and site reconnaissance
- Preparation of a Phase One ESA report
- Submission of the Phase One ESA report to the owner of the Phase One Property

The Phase One ESA was completed to satisfy the requirements for Phase One ESAs as specified within O. Reg. 153/04 (MECP, 2011a), to facilitate the potential redevelopment of the Site, including the development of a subsequent Phase Two ESA Program.

The Phase One ESA findings were used to support the development of a subsequent Phase Two ESA investigation for the Site to assess the subsurface environmental conditions and assist in the development of a recommended remedial or risk management strategy that may be considered for ongoing use or redevelopment of the Site.

Current and Past Uses

Based on information obtained from the records review and interviews, the Site was considered to be first developed in 1913 when it was acquired by IMICO for use as an iron-jobbing foundry. Historical onsite buildings/structures and areas were identified from fire insurance plans (FIPs) and site plans in previous reports including the foundry, annealing room, chipping room, galvanizing buildings, warehousing, storage (coal, sand, bricks, polychlorinated biphenyl [PCB] materials), paint shop and offices.

The foundry closed in 1989, and the site was generally vacant from that time on, with the exception of some reported community-type occupancy of the Site during the time of the Assembly of the Church of the Universe ownership (1993 to 1997). A number of fires occurred during this period, and in 1997 the City took over the Site. Demolition of the buildings and removal of various wastes from the Site (including some excavated soil and PCB materials and a large above-ground storage tank [AST]) occurred in 1998 through 1999. The Site is currently vacant with no onsite operations occurring. No buildings or structures are located onsite, however the majority of the concrete floors, foundations and footings of historical buildings remained onsite at the time of the site reconnaissance (June 21 and 29, 2017).

Table 7.1-1 summarizes the current and historical land uses at the Phase One Property, based on the results of the records review, and this table includes the inferred historical occupant or activity.

Environmental Reports

The City provided CH2M with the environmental reports that had been previously completed for the Phase One Property. The intent of the environment report review was to identify key environmental concerns regarding actual and potential areas of environmental concern within the Site and its adjacent properties.

The report list has been provided as Table 4.1.5-1, with a brief summary of each investigation or study.

Potentially Contaminating Activities

Based on a review of historical environmental reports, aerial photographs, FIPs, chain of title searches, city directories, interviews, an EcoLog Environmental Risk Information Service (ERIS) database search, and site reconnaissance, the Phase One ESA identified PCAs or historical land uses of potential environmental interest on the Site.

The following PCAs were identified on the Phase One Property, and resulted in an APEC:

- 8 – Chemical Manufacturing, Processing and Bulk Storage
- 27 – Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation Vehicles
- 28 – Gasoline and Associated Products Storage in Fixed Tanks
- 30 – Importation of Fill Material of Unknown Quality
- 32 – Iron and Steel Manufacturing and Processing
- 33 – Metal Treatment, Coating, Plating and Finishing
- 34 – Metal Fabrication
- 39 – Paints Manufacturing, Processing and Bulk Storage
- 46 – Rail Yard, Tracks and Spurs
- 55 – Transformer Manufacturing, Processing and Use

The following PCAs were identified off the Phase One Property, but within the Phase One Study Area:

- 8 – Chemical Manufacturing, Processing and Bulk Storage
- 10 - Commercial Autobody Shops

- 11 - Commercial Trucking and Container Terminals
- 12 - Concrete, Cement and Lime Manufacturing
- 27 – Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation Vehicles
- 28 – Gasoline and Associated Products Storage in Fixed Tanks
- 33 – Metal Treatment, Coating, Plating and Finishing
- 34 – Metal Fabrication
- 37 - Operation of Dry Cleaning Equipment (where chemicals are used)
- 39 – Paints Manufacturing, Processing and Bulk Storage
- 43 - Plastics (including Fibreglass) Manufacturing and Processing
- 45 - Pulp, Paper and Paperboard Manufacturing and Processing
- 47 – Rubber Manufacturing and Processing
- 49 - Salvage Yard, including automobile wrecking
- 54 - Textile Manufacturing and Processing
- 55 – Transformer Manufacturing, Processing and Use
- 57 - Vehicles and Associated Parts Manufacturing

Figure 7-2 shows the locations of the identified APECs as a result of the PCAs.

Areas of Potential Concern

The identified PCAs results in 33 APECs that CH2M considered to have the potential for subsurface environmental impacts to the Site. Of these, 29 APECs on the Site are considered to be attributable to onsite PCAs, and 4 APECs are considered attributable to offsite PCAs within the Phase One Study Area. The APEC locations are presented in Figure 7-2, and summarized in Table 7.3-1. Contaminants of potential concern (COPCs) have been identified for each APEC in Table 7.3-1 based on the historical operations and type of PCA associated with each APEC.

The identified APECs are summarized as follows:

1. Foundry - A foundry was operated on the site by IMICO from 1913 to 1989 when the plant closed and was abandoned. The foundry operated as an iron-jobbing facility for the production of various metallic forms using malleable and ductile iron (DCS, 2014a). Foundry sands were predominantly located in the concrete pits and sumps of the main Foundry building. Foundry sands, sludge materials, and process waste were removed from the site and buildings were demolished in 1999 (Earth Tech, 1999). The P&R investigation also reported that moulding sands and dust collector waste was stored at the northwest corner of the building and drained to the truck bay (P&R, 1991).
2. Machine Shop - A machine shop was shown on the 1916 FIP, east of the original foundry. The northern one-third of the Machine Shop was identified for 'Tumbling and Cleaning' operations, inferred to be in association with the adjacent 'Annealing Room' to the north. FIPs prepared in 1929, 1945 and 1960 showed this area changed operations to 'Shipping', and a 'Pattern Shop'.
3. Annealing - An 'Annealing Room' with four furnaces is shown on the 1916 FIP. A brick chimney is located on the north wall. The 1929 FIP shows nine furnaces with the Annealing Room extended westward with an additional chimney on the north wall within the extended area; the southern portion of the Annealing Room is identified as the 'Tumbling Dep't'. The 1946 FIP shows a structural addition on the east side of the Annealing Room, with two additional furnaces. The 1960 FIP shows further eastward expansion and the addition of a third furnace. Tumbling Dep't operations appear consistent in location and footprint, from 1929 through to 1960. The furnaces are inferred to be coal fired from 1916 through to 1960, based on the nearby coal storage areas shown on the 1946 and 1960 FIPs, and the absence of ASTs or underground storage tanks (USTs) for fuel oil storage on any of the FIPs. The furnace fuel from after 1960 to the end of operations in 1989 is not known, but a period of

fuel oil fired operation of the furnaces is suspected; see APEC 7. No information was identified to suggest coal or fuel oil storage within the Annealing Room; however, no information regarding temporary furnace fuel storage, transmission or waste disposal was identified. Dust control equipment is shown on Figure 4 of the 1991 P&R report, on the north side of the Annealing Room.

4. Sand Storage - The 1916 FIP shows a 'Sand Shed'. The 1929 and 1946 FIPs again show the Sand Shed, plus a second smaller building to the west labelled 'Sand'. The 1960 FIP shows the original 'Sand Shed' as 'Bricks' and the second smaller building to the west labelled as 'Sand & Bricks', and an additional area to the north labeled 'Sand'. No information was identified to if only clean process, spent foundry sands or both were stored in these buildings, therefore the potential storage of spent foundry sand in these buildings is considered. The purpose and types of bricks stored was not identified. The potential for new and used refractory brick and associated process materials is considered possible.

5. Galvanizing Building - A small free standing building for 'Galvanizing' was present on the southeast portion of the Site as shown on the 1916, 1929 and 1946 FIPs. The Galvanizing building was not shown on the 1960 FIP, with the area occupied by a larger new structure identified as 'Fittings Whse' (warehouse). No information was identified regarding process chemical use and storage, or waste management practices, in association with the galvanizing operations conducted.

6. Chipping/Grinding Room - A 'Chipping Room' was shown on the FIPs prepared in 1929, 1946 and 1960, located west of the Annealing area. The 1916 FIP shows this as exterior yard area west of the 'Annealing Rm', with a small outbuilding that appears to be connected to the Annealing Room with a linear underground feature. The 1991 P&R report identified this as a 'Trimming and Grinding' area; this information inferred to be based on the interview of historical IMICO employees. 'Dust control equipment' is shown on Figure 4 of the 1991 P&R report, on the exterior west side of the building.

7. Oil Houses, Boiler House and ASTs - A building is shown on the 1929 FIP to the north of the Foundry and east of the power house with a label "Oil", and an additional building with the same label is shown to the north of this original building on the 1946 FIP. The 1960 FIP shows the north building remaining, but is not labeled as an oil house. The 1916 FIP shows this as empty exterior yard area north of the foundry. The P&R Investigation figures show a boiler house to the east of the power house, and two 45,000-L (10,000 gallon) oil tanks to the east of the building with "no history of leaks or spills" (P&R, 1991). One 45,000-L AST was reported removed in 1998 during demolition activities and had been used to store Bunker C fuel. The AST removed had been located east of the Core Room (Earth Tech, 1999).

8. Gasoline UST - As indicated on the 1960 FIP, a gasoline UST is shown north of a small office building, and west of 'scales' at the corner of Kingsmill Avenue and Beverley Street. The area is empty exterior yard area on the 1916 FIP, and the 1929 and 1946 FIPs show the office (labeled as a 'time office'), but does not show the UST. The gasoline use is not known; however, it is inferred to be for fueling gasoline-powered equipment/vehicles used at the plant. The 1991 Proctor & Redfern investigation reported that an IMICO employee indicated the UST was removed in the mid-1980s in response to a request from the City due to gasoline vapours in the sewers along Beverley and York Streets. No significant contamination was reported (P&R, 1991).

9. Oil House - A building is shown on the 1929 and 1949 FIP to the south of the Foundry and west of the galvanizing building with a label "Oil". The building/structure is not on 1916 FIP where the area is shown as exterior yard area, and is not present on the 1960 FIP where the area is occupied.

10. Machine Shop - A machine shop is shown on the 1929, 1946 and 1960 FIP, east of the original foundry building. The floor is indicated as concrete. Machine shop cuttings were stored on the ground north of the building, and two small ceiling mounted oil tanks were present in the building as

noted in the P&R investigation (1991). The area is shown on the 1916 FIP as exterior yard area, with a small unidentified building in the central area of the future machine shop.

11. Plating/Galvanizing Building - A galvanizing building was present on the Site as shown on the 1946 and 1960 FIP. The previous FIPs (1916 and 1929) show this as exterior yard area. On subsequent site plans (P&R, 1991; Earth Tech 1999), the building was identified as a storage shed and reported as having been used for dip galvanizing before 1975, with rinse water discharged into "dry wells" north of the building (P&R, 1991). Investigations by P&R and Gartner Lee indicated high concentrations of zinc, other metals, and oil & grease. Free product was observed in wells (OW01-I, OW20, OW21). The area was excavated to bedrock (ranging from 1.3 to 2.0 mbgs and approximately 9,400 tonnes of contaminated soil and 925 tonnes of contaminated concrete were removed. Soil samples were collected from the final limits of the excavation walls and indicated most locations having zinc and TPH concentrations above the Table A Guidelines. The excavation was backfilled with granular "B" materials. A single sample was collected from the backfill and met the guidelines applicable at the time of the report (Earth Tech, 1999). A well nest (OW22S/D) was installed within the excavation area (the report for this installation was not available and therefore the soil conditions are unknown if analyzed as part of the investigation). Testpits and boreholes installed in the area in 2013 by DCS indicated soils having high zinc and other metal concentrations. Groundwater conditions at OW22S reported free product which was highly weathered with a slight oil/diesel odour (as reported in the summary of the Gartner Lee 2000/2001 investigation in DCS, 2007a). Borehole logs for OW22S/D indicate the presence of fuel/diesel type odour in the fill which extends to approximately 1.5 mbgs; and hydrocarbon odour extending into the underlying bedrock with black staining on fractures. Groundwater sampled from OW22S has not since reported free product, but has had concentrations of petroleum hydrocarbons (PHCs) increasing since the annual monitoring at this location began in 2016, up to 850,000 micrograms per litre (µg/L) of F3. Zinc concentrations have widely fluctuated over the years and have exceeded in approximately 25 percent of the sampling events between 2005 and 2016.
12. Coal Storage - A coal shed is shown on the 1946 FIP, to the north of the foundry and west of the powerhouse. A larger coal storage area is shown on the 1960 FIP, and the building is extended south to connect with the foundry on subsequent site plans (P&R, 1991; GLL, 1999; Earth Tech 1999) without an indication of its use. The previous FIPs (1916 and 1929) show this area as exterior yard area.
13. Rail Line - A former rail line was shown onsite north of the buildings on the 1916, 1929 and 1946 FIPs, running east to west, for the full length of the foundry building. On the 1960 FIP, the western portion was shown to have been removed, to accommodate the newly constructed shipping/stock room; the rail siding ended at the eastern side of the building. It is inferred that raw materials and finished products were shipped by rail.
14. Possible Automobile Storage, Maintenance and Repair - An addition south of the foundry building, on the east side of the offices, is labeled "Auto" on the 1960 FIP. Previous FIPs (1916, 1929, 1946) show this as exterior yard area.
15. Sand Mixing/Storage - Sand mixing is shown in a building north of the foundry as shown on the 1960 FIP. Previous FIPs (1916, 1929, 1946) show this as exterior yard area, north of the foundry. Subsequent site plans (P&R, 1991; GLL, 1999; Earth Tech 1999) do not have an indication of the buildings use.
16. Transformers - Transformers are first shown on the 1960 FIP, north of the powerhouse. Previous FIPs (1916, 1929, 1946) show this as exterior yard area north of the power house. Transformers of this era may have contained PCBs.
17. Capacitor Room - PCB-containing capacitors were present in the centre of the foundry, as first shown on the P&R investigation site plan, and later remediated as part of the Earth Tech demolition

(P&R, 1991; Earth Tech, 1999). Activities included removal of a concrete floor, a utility trench located in the eastern section (concrete walls, granular base) that was heavily stained, a subfloor was present in the central section, and a sump located in on the eastern portion of the capacitor room that were all indicated as PCB-impacted and excavated and disposed offsite. The area was excavated to bedrock (1.0 - 1.3 mbgs) to remove concentrations above 5 micrograms per gram (µg/g). Final samples (composite soil, soil, concrete and bedrock) from the limits of excavation in the capacitor room reported PCB concentrations under 5 µg/g, with the exception of two bedrock samples within the eastern sump area that had concentrations around 10 µg/g. A well (OW25) was installed within the excavation area (the report for this installation was not available and therefore the soil conditions are unknown if analyzed as part of the investigation) and subsequent groundwater monitoring of the area have indicated concentrations of chlorinated VOCs and PHCs (mainly F3) greater than the applicable potable water criteria (Table 6 Standards) (DCS, 2007b, 2014b; AECOM 2017a, 2017b)

18. Coal Storage - A building for coal storage is shown on the 1960 FIP, to the north of the annealing room, with additional 'coal piled' to the west of the building. Previous FIPs (1916, 1929, 1946) show this as exterior yard area to the north of the annealing room. The coal is inferred to be used in the furnaces in the annealing room. Subsequent site plans show this as a storage area (P&R, 1991; DCS, 2007a).
19. Coal Storage - A small building for coal storage is shown on the 1960 FIP, east of the time keepers office at the Beverley Street entrance. The building is not present on previous FIPs (1916, 1929, 1946) and is shown as exterior yard area.
20. Garage - A garage was shown on the 1946 and 1960 FIP along Stevenson, on the west side of the property. The building is not present on previous FIPs (1916, 1929) and is shown as exterior yard area. The site investigation by P&R (1991) identified visual impacts to the soils south of the garage. Some elevated PCB concentrations were found in soil during subsequent investigations.
21. Coal Storage - The 1960 FIP indicates coal storage south of the garage on the west side of the Site. The building is not present on previous FIPs (1916, 1929) and is shown as exterior yard area, and on the 1946 FIP, the building is not labeled as coal.
22. Transformer - A 1200-volt transformer is shown on the 1991 Site Plan (P&R, 1991).
23. Paint Shop - First shown on the P&R Site plan, a paint shop was located at the north end of the site, between the shipping building and the storage area (P&R, 1991). Drums were stored against the north wall for materials used in the paint shop. The FIPs show this area as exterior yard area in the early FIPs (1916, 1929, 1946) and empty space between existing buildings in the 1960 FIP.
24. PCB Storage Area - An area located at the northeast corner of the finishing and annealing room, with a concrete pad was identified in the Earth Tech investigation as a former PCB Storage area. Concentrations above 50 ppm of PCBs were identified. Previous site maps showed this area as 'storage' (P&R, 1991) or part of the Annealing Room (1946 and 1960 FIPs). During the demolition activities, approximately 250 kg of PCB-containing ash residue from the top of the concrete pad, and the concrete pad itself was removed and taken for offsite disposal (Earth Tech, 1999). Confirmatory samples below the pad were 0.63 µg/g and less than 0.05 µg/g. The soil was later excavated to bedrock as part of the soil remediation in the northeast corner of the property (see APEC-11).
25. Drum Storage - Interviews with former employees as part of the P&R investigation identified drum storage activities which occurred along the north property boundary (P&R, 1991). No additional information was provided on the nature of what was stored and whether there was any associated contamination as a result of the materials.
26. Former Substation - A former substation is indicated on the P&R (1991) and Earth Tech (1999) site plans. A sample of transformer oil from the former substation analyzed in the Earth Tech report

indicated non-detect concentrations of PCBs. Similarly, one location installed during the DCS Phase II ESA (2007b) indicated non-detect PCB concentration. Previous site plans (FIPs) show this area as exterior yard areas.

27. Former Electrical Shop - A small electrical shop was noted to be on the southwest corner of the foundry (P&R, 1991). This addition was not shown on the FIPs from previous years, and was shown as the exterior yard area west of the foundry.
28. Waste Oil Storage - Used oil was stored above ground on the southwest end of the foundry as shown on the P&R Site Plan (P&R, 1991).
29. Fill of Unknown Quality - All areas of the Site have a layer of fill above the native silty sands. Previous investigations have indicated a layer of fill consisting of foundry sands, slag and cinders (up to 1.0 m) was found across the site (P&R, 1991) and the fill to be mix of foundry operation waste such as "coal, clinker, ash, metals and detritus from the former foundry operations" and reworked native from "reworking onsite soils as a result of initial construction and subsequent expansion activities" (DCS, 2007b). The yard areas were additionally noted to have been oiled (presumably engine oil) (P&R, 1991).
30. Potential Impacts from Adjacent Properties to the North – historical and current operations on properties to the north have the potential to impact the Phase One Property, including: rail lines, paper manufacturing, auto body repair shops, gasoline station, trucking company, concrete products manufacturing, plastic products manufacturing, electroplating company, window/door manufacturing, paint application and scrap yard.
31. Potential Impacts from Adjacent Properties to the East – historical operations on the property to the east have the potential to impact the Phase One Property, including: steel manufacturing, foundry operations, packing manufacturing, potential USTs, bulk fuel storage, scrap yard, chemical manufacturer/distribution, and transformer use,
32. Potential Impacts from Adjacent Properties to the South – historical operations on properties to the south have the potential to impact the Phase One Property, including: metal product manufacturing, potential USTs, and transportation company.
33. Potential Impacts from Adjacent Properties to the West – historical operations on properties to the west have the potential to impact the Phase One Property, including: window manufacturing, metal treatment, metal product manufacturing, former refractory facility, and motor vehicle part manufacturing.

Soil and Groundwater Quality from Previous Investigations

The Phase One ESA identified areas on the Site where previous subsurface investigations had identified contaminants of concern in soil and groundwater at concentrations exceeding the Ontario Ministry of the Environment, Conservation and Parks' (MECP's) *Table 6 Generic Site Condition Standards for Shallow Soils in a Potable Groundwater Condition* for Residential/ Parkland/ Institutional/ Industrial/ Commercial/ Community property use and coarse textured soils, which are specified in the *Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act,* dated April 15, 2011 (Table 6 Standards) (MECP 2011b). Analytical results were summarized from previous investigations conducted by P&R (1991), Gartner Lee (1999), AECOM (2010 to 2016), Earth Tech (1999), DCS (2007 and 2014) and WSP (2016).

Soil Quality

Previous soil investigations were conducted on the Site by P&R (1991), Gartner Lee (1999), Earth Tech (1999), DCS (2007 and 2014) and WSP (2016) and indicated soil exceedances of the Table 6 Standards

for metals and inorganics, volatile organic compounds (VOCs), PHCs, polycylic aromatic hydrocarbons (PAHs), and polychlorinated biphenyls (PCBs). The following points summarize the findings of these investigations:

- Inorganic and metals exceedances were widespread across the Site. The predominant chemical found was zinc, with concentrations over 10,000 µg/g found in the northeast corner of the Site in the area of the former galvanizing/plating building. The area was excavated to bedrock in 1999 and backfilled with granular 'B' material (Earth Tech, 1999). Soil samples collected in the area after remediation indicate exceedances of zinc, cadmium, cyanide and lead. Exceedances over the remainder of the Site other than zinc were mostly due to lead and cadmium.
- VOC concentrations that were detected above the Table 6 Standards were limited to benzene, toluene, ethylbenzene, xylene (BTEX), tetrachloroethylene (PCE), and trichloroethylene (TCE) at five locations. Benzene, ethylbenzene and xylene had marginal exceedances in the area of the former maintenance garage; benzene had a marginal exceedance south of the PCB capacitor room; and TCE and PCE were detected at low concentrations (under 1 µg/g) at three locations near the northeast property line.
- Locations where PHCs were analyzed in accordance with current methodology were limited to five boreholes and ten test pits sampled by DCS in 2007 and 2014. Concentrations detected above the Table 6 Standards were found for F3 in two locations: southeast of the former capacitor room and south of the northeast excavation. Older hydrocarbon analyses showed elevated concentrations near the former maintenance garage, in the area of the former fuel ASTs, the paint shop, the southwest end of the foundry and at the northeast excavation area. Confirmatory wall samples of the excavation indicated remaining elevated TPH concentrations.
- PAHs were detected at concentrations above the Table 6 Standards at approximately 30 percent of the locations analyzed. Exceedances were found at various locations across the Site, including samples from the excavated soil at the northeast portion of the Site. The highest concentrations were found southeast of the former capacitor room at concentrations up to 900 µg/g.
- PCB concentrations above the Table 6 Standards were found in the area of the former maintenance garage, at confirmatory samples from the PCB remediation in the former capacitor room, and southwest of the former machine shop. Concentrations were found up to 10 µg/g.

Groundwater Quality

Previous investigations were conducted by P&R (1991), Gartner Lee (1999 and 2004), AECOM (2010 to 2016) and WSP (2016), and indicated groundwater exceedances of the Table 6 Standards for metals and inorganics, VOCs, PHCs, PAHs, and PCBs. Full site characterization for all monitoring wells and parameter groups has not been conducted since 1998. Subsequent sampling has focused on the east portion of the Site for the primary COCs, with annually sampling conducted by AECOM since 2010. The following points summarize the findings of the investigations:

- Metal and inorganic exceedances detected on the Site were mainly due to zinc which has exhibited exceedances over most of the Site. The highest concentrations of metals were generally found in the northeast corner of the property by the former galvanizing building. Prior to the excavation zinc was measured up to 42,000 µg/L; after remediation, concentrations of zinc were found up to 3,200 µg/L. Lead was found at four locations across the Site exceeding the Table 6 Standard with concentrations up to 32 µg/L. Thallium, arsenic, barium and cadmium were found in localized areas along the southeast and southwest property boundary. Other metal exceedances were limited samples collected within the northeast corner prior to excavation (antimony, beryllium, chromium, cobalt, copper, mercury, molybdenum, nickel and vanadium).

- VOC exceedances detected on the Site were mainly chlorinated VOCs and BTEX parameters. The chlorinated VOCs were found mainly on the eastern portion of the Site, with high concentrations for TCE, cis- and trans- 1,2-dichloroethylene (DCE), and vinyl chloride. Lower concentrations of TCE were found over most of the central and eastern portions of the Site. Other than historical detections prior to the northeast excavation, trichloroethane (TCA) and derivatives were found on the south portion of the Site with the highest concentrations downgradient of the former electrical shop at 140 µg/L. The highest concentrations of BTEX were measured in the northeast portion of the property, from sampling events prior to the soil excavation in the area. BTEX concentrations on the remainder of the property was below the Table 6 Standards with the exception of one location in the vicinity of the former UST.
- Of the samples where PHCs were analyzed in accordance with current methodology, seven locations had exceedances of the Table 6 standards. Most of these were located in the eastern portion of the Site, with the exception of one located in the vicinity of the former capacitor room. Free product has been observed at OW23S on multiple occasions. Older hydrocarbon analyses indicated elevated concentrations in the northeast area that was excavated, near the former maintenance garage, in the vicinity of the former ASTs, and near the south property corner
- PAHs were found exceeding the Table 6 Standards in 8 locations onsite. The greatest concentrations were from pre-excavation samples collected in the northeast area of the Site, up to 229,000 µg/L. Concentrations post-remediation were found up to 280 µg/L. Elevated concentrations were also found at OW23S where free product has been detected. Other areas across the Site reported detected concentrations below 3 µg/L.
- Of 16 locations where PCBs were analyzed, one location exceeded the Table 6 Standards, located southeast of the foundry. The PCB remediated area of the former capacitor room reported concentrations of 1.27 µg/L.

Phase One Conceptual Site Model

A conceptual site model (CSM) was prepared for the Site. The following bullets summarize the principal elements of the CSM:

- Buildings do not exist on the Phase One Property. Historical building foundations and other potential below grade structures remain. No buildings were known to have basements; however, based on historical reports, pits and sumps were present throughout the foundry.
- Waterbodies do not exist within the Phase One Study area. The closest water body to the Site is the Eramosa River which is approximately 0.5 km southeast of the Site and travels 1.4 km before running into Speed River as shown on Figure 2-1.
- There are no areas of natural and scientific interest within the Phase One Study Area based on presently available information.
- No existing drinking water wells were identified on the Phase One Property. Thirty wells indicated as water supply or domestic use wells were identified within 1 km of the Site. All wells were found to be located outside the Phase One Study Area. All water wells within 1 km of the Site are shown on Figure 4-4.
- Figure 6-1 presents the roadways and land use within the Phase One Study Area.
- Based on the Phase One ESA, a number of PCAs occurred in the Phase One Study Area which are summarized within the APECs in Table 7.3-1, and locations shown on Figure 7-1.

- Based on the Phase One ESA, 29 PCAs were identified onsite and have been identified as APECs. Four APECs associated with offsite PCAs within the Phase One Study Area have been interpreted to have the potential to impact the Phase One Property. The areas where these 33 APECs are interpreted to have potential impacts are shown on Figure 7-2.
- The COPCs identified within the Phase One Study Area include metals and inorganics, VOCs, PHCs, PAHs, PCBs, acid base neutral components (ABN) and CPs. This list includes COPCs that are confirmed to be present based on historical investigations. Based on previous reports and contaminant concentrations, there is a potential for free phase product to exist on the Site.
- Although utilities have been disconnected onsite, piping and bedding have not been removed and, therefore, there is a potential for utility corridors to be providing a preferential route of contaminant migration.
- The Site topography varies from approximately 315 and 316.5 masl based on topographic information and previous investigations completed at the Site. The Site and surrounding lands generally slope southeast to the Eramosa River.
- Geology from previous investigations indicate subsurface materials consisting of fill (varying from 0.3 to 3.2 m deep), underlain by native silty fine sand. The approximate bedrock depth based on past investigations on the Site was 2.0 mbgs (elevation of 313.5 masl), and ranged from approximately 0.7 m to 3.4 mbgs (elevation of 312.7 to 315.0 masl). The bedrock was described as dolostone, grey, porous and highly fractured with a rock quality index indicating it is highly weathered and fractured (GLL, 1999).

i) The regional geology indicates the Phase One Study Area consists of “silt to sandy silt matrix, becoming silt to silty clay near Lake Erie, strongly calcareous, moderate to low clast content decreasing southward” (OGS, 2000), and bedrock of the Guelph Formation, consisting of sandstone, shale, dolostone, siltstone (OGS, 1991). The bedrock elevation is approximately 305 masl based on *OGS Preliminary Map P.2224, Guelph Area, Southern Ontario, Bedrock Topography Series* (Karrow, 1979).

- Groundwater levels at the Site have been measured during previous investigations between 2.02 and 4.13 mbgs (310.84 to 316.40 masl) with an inferred groundwater flow direction to the south, toward the Eramosa River.

This information has also been summarized in Table 7.4-1.

Based on the uncertainties documented in the Phase One ESA (CH2M, 2017), it is possible that a PCA/APEC or land use has not been identified within the individual components of the Phase One ESA. Information was gathered from numerous sources (including aerial photographs, City Directories, database searches, historical reports, interviews, and site reconnaissance), which decreases the chance that a major PCA or land use was not identified in the Phase One ESA. Many aspects of the CSM have been previously studied and verified through subsurface investigations (for example, groundwater flow direction); these aspects are not directly affected by the noted uncertainties.

Phase One ESA Conclusions

Based on the findings of the Phase One ESA investigation (CH2M, 2017), potential and confirmed impacts exist at Site, and a Phase Two ESA will be required before an RSC can be filed. Previous subsurface investigations have been completed onsite and have documented that its subsurface quality does not meet O. Reg. 153/04, as amended, standards for the proposed redevelopment with more sensitive land uses. Additional subsurface characterization and associated environmental work is required before an RSC is filed.

Table 4.1.5-1. Summary of Environmental Reports

Phase One Environmental Site Assessment, 200 Beverley Street, Guelph

Report Title	Date	Author	Prepared for	Description [a]
Environmental Investigation, International Malleable Iron Company, 200 Beverley Street, Guelph Ontario	June 10, 1991	Proctor & Redfern Limited	The Bank of Montreal	An environmental investigation, including a background review, was conducted onsite that incorporated a preliminary investigation conducted by P&R in 1989. The background review included a title search, review of aerial photographs, FIPs, and building permits as supplied by the City of Guelph, discussions with municipal and MOECC personnel, and an interview with a former IMICO employee. The field program included excavating 55 test pits, advancing 5 boreholes (completed as monitoring wells) and completing 16 corehole locations in 1991. The test pit locations included central test pits (A to L in 1989, and 1 to 12) in areas of suspect soil contamination, excavated to clean native soil or bedrock, and an additional 31 shallow test pits to help delineate contaminants.
City of Guelph, Former IMICO Facility Demolition and Waste Removal Report	October 7, 1999	Earth Tech (Canada) Inc.	City of Guelph Works Department Engineering Services Division	Earth Tech (previously P&R) was retained to provide contract tendering and administration of the demolition of buildings and clean up of waste materials at the Site to address the Director's Order issued by the MOECC in 1994. Waste materials (ACM, PCB-containing material, liquid wastes, foundry sands, contaminated concrete) were removed from the Site and Remediation (excavation and disposal) was completed for two areas on the Site: the north east corner of the Site where a previous plating room was located, and the area of the capacitor rooms that formerly housed PCB capacitors. Removal activities in the capacitor room included removal of a concrete floor, a utility trench, a subfloor, and a sump that were all indicated as PCB-impacted; material was excavated and disposed offsite. The area was excavated to bedrock (1.0 - 1.3 mbgs) to remove concentrations above 5 µg/g. Final samples (composite soil, soil, concrete and bedrock) from the limits of excavation in the capactor room reported PCB concentrations under 5 µg/g, with the exception of two bedrock samples within the eastern sump area that had concentrations around 10 µg/g. Investigations by P&R and Gartner Lee indicated high concentrations of zinc, other metals, and oil and grease in the northeast corner of the Site. The area was excavated to bedrock (ranging from 1.3 to 2.0 mbgs and approximately 9,400 tonnes of contaminated soil and 925 tonnes of contaminated concrete were removed. Soil samples were collected from the final limits of the excavation walls and indicated some zinc and TPH concentrations above the Table A Guidelines. The excavation was backfilled with granular "B" materials. A single sample was collected from the backfill and met the guidelines at the time. Groundwater monitoring programs were recommended for areas downgradient of the capacitor room and northeast corner of the Site.
Supplemental Hydrogeological Investigation Former IMICO Site	March 8, 1999	Gartner Lee Limited	The City of Guelph	A hydrogeological site assessment was conducted that consisted of drilling eleven boreholes, installing nine monitoring wells (four in the bedrock) and collecting soil and groundwater samples. The stratigraphy over most of the Site was defined as coarse fill materials underlain by native silty fine sand. The depth of the fill materials ranged from 0.3 to 3.2 m from the southern to the eastern portions of the Site. Shallow groundwater flow was observed from the south to southwest, with a high around OW2. The average lateral velocity was measured at 107 m/yr. Flow in the bedrock was generally to the south with a velocity of 14 m/yr. Vertical gradients were downwards, with the exception of OW9 and OW11 where measurements indicated occassional upward gradients. Soils were found to be impacted with metals (mainly zinc and lead), TPH, VOCs and PAH/phthalates in the area immediately east of the former annealing room, with impacts found up to the top of bedrock (1.5 to 2.0 mbgs). Groundwater was found impacted with TPH (heavy oil), zinc, and lead which were primarily found at the northeast portion of the Site. Some localized exceedances of PAHs were also reported. Elevated chlorinated VOCs (specifically TCE and VC) were observed on the east property boundary (OW18 and OW19). NAPL was identified at OW21-1 within the dolostone bedrock which was determined to be fuel oil comprised of PAHs/phthalates. Suspected free product was previously observed in monitoring wells in the same area (OWI-1). The development of a remedial action plan was recommended.
Contaminant Investigation 490 York Road, Guelph, Ontario	May 12, 2004	Gartner Lee Limited	The City of Guelph	An investigation of the adjacent property at 490 York was conducted in a response to an MOECC Provincial Order (No. 7616-5LAL3S) from 2003 to better define groundwater quality and source of the VOC contamination at the east end of the IMICO site. Three pairs of monitoring wells (OW28, OW29, and OW30) were installed (shallow at approximately 6 m and deep at approximately 12 m), developed and sampled for analysis of major ions, metals, TPH, VOCs, PAHs, and general chemistry. It was noted in the report that groundwater at the northeast corner of the IMICO site may be influenced by water takings (industrial) at Holody, located 500 m to the northeast. Shallow groundwater was noted to flow to the southeast within the investigation area, likely influenced by the presence of the bedrock ridge. Other factors affecting the flow include buried services such as storm drains, low permeable surfaces (asphalt, buildings, concrete), and surface topography. It was noted in the report that groundwater at the northeast corner of the IMICO site may also be influenced by water takings (industrial) at Holody, located 500 m to the northeast. The stratigraphy was found to be composed of fill (up to 0.4 mbgs), native soil, and dolostone bedrock. The depth to bedrock ranged from 2.2 to 4.3 mbgs. Vertical gradients at the newly installed well nests were found to be downward. Chlorinated VOCs (TCE and degradation products), lead, and zinc were found in the groundwater on 490 York Road.

Table 4.1.5-1. Summary of Environmental Reports

Phase One Environmental Site Assessment, 200 Beverley Street, Guelph

Report Title	Date	Author	Prepared for	Description [a]
Phase I Environmental Site Assessment Former IMICO Property 200 Beverley Street, Guelph, Ontario	December 20, 2007	Decommissioning Consulting Services Limited	The City of Guelph	DCS conducted a Phase I ESA of the Site to prepare for its redevelopment, which required a subsequent Phase II ESA, and remedial action plan activities. The Phase I ESA consisted of a historical review of past land use (ERIS, aerials, ownership information), review of previous reports, and a site reconnaissance. The IMICO Site was determined to be first developed in 1912 as a foundry and was closed/abandoned in September 1989. The site reconnaissance provided limited information as there were no buildings/structures present. Information that was gathered from reports reviewed by DCS that were not available to CH2M are as follows: Philip Environmental - Earthtech Remedial Program 1989/1999 - included the decomissioning of wells OW01-I, OW01-II, OW20 and OW21 in the northeast corner of the site in April 1999, before the excavation of soil in the area. Gartner Lee Investigations 2000/2001 - included the installation of six monitoring wells in three locations (OW22S/D, OW23S/D and OW24S/D) following the excavation of impacted soils in the northeast corner of the property, and an additional well (OW25) in the vicinity of the remediated capacitor room. Additionally, nine test pits were advances in the southwestern portion of the property because of anomalies detected on the geophysical survey conducted. The anomolies were determined to be buried ferrous material. Soil sample collected indicated elevated zinc and TPH concentrations. Free product was noted in two of the shallow monitoring wells (OW22S and OW23S), which was found to be highly weathered with a slight oil/diesel odour. It was noted that the soil and groundwater conditions did not meet the background standards for metals, PHCs, and PAHs at many locations. Additional subsurface investigations were recommended in the following areas: - Current concentrations of the residual contamination at the eastern property boundary in soil and groundwater (metals, VOCs, PHCs); volatiles may have degraded from original concentrations - Further definition of the residual PCB contamination in the soil and groundwater in the vicinity of the capacitor room - Delineation of metal and occasional VOC impacts on the western site boundary - Investigation of groundwater impacts downgradient of the Site on Kingsmill Avenue
Phase II Environmental Site Assessment Former IMICO Property 200 Beverley Street, Guelph, Ontario	December 21, 2007	Decommissioning Consulting Services Limited	The City of Guelph	A total of 40 boreholes were advanced at the Site, with 10 locations completed with monitoring wells (BH07-40 through BH-71, OW07-31 through OW07-38). Two of the monitoring well locations had both a shallow (5 to 7 mbgs) and deep (10 mbgs) monitoring well installed at the location (OW-24 and OW36). Analytical results were compared to both the Table 1 and Table 2 Standards. Soil exceedances included metals (widespread), PHCs (eastern end of the property, in the vicinity of the former maintenance garage, and one sample south of the capacitor room; F3 the predominant fraction), limited VOC exceedances (BTEX, no chlorinated VOCs identified), PAHs, and PCBs (maintenance garage and south of the former capacitor room). Synthetic leach samples for metals, VOCs, PHCs, PAHs, and PCBs indicated concentrations of copper, lead, and zinc exceeding proposed criteria. Groundwater exceedances included metals (mainly zinc on the east property boundary), PHCs (northeast end of property and south of the capacitor room), VOCs (mainly chlorinated VOCs with the highest concentrations on the east end of the Site), PAHs, and PCBs (one south of the capacitor room). DCS concluded that given the nature of the soil and groundwater quality on the Site, an extensive soil remediation program would be required to clean up to generic standards for the property to be suitable for residential or parkland use. Additionally, they concluded if using a RA, the property boundaries would still need to meet MOECC potable groundwater standards.
Preliminary Remedial Action Plan Former IMICO Property 200 Beverley Street, Guelph, Ontario	March 6, 2008	Decommissioning Consulting Services Limited	The City of Guelph	Four main scenarios were considered for the preliminary remedial action plan: 1) Using applicable Table 1 Standards (background) 2) Completing a limited scope RA to allow for the use of Table 2 Standards (potable) 3) Completing a limited scope RA to allow for the use of Table 2 Standards and elevated zinc background values 4) Completing a full scope RA for the proposed site specific land use Option 1 required the remediation of approximately 80,000 cubic m3 of soil, Option 2 would reduce the remediation required to 54,000 m3 of soil, Option 3 would require 23,000 m3 of soil based on the evidence of elevated background zinc concentrations in the Guelph area. Option 4 assumes many soil impacts can be managed on site by risk management measures and limited soils would require removal. For groundwater, the western part of the Site indicated the most practical approach to be completing a limited scope RA to justify the use of Table 2 Standards and installation of recovery wells and a standby treatment system to prevent potential contamination migrating offsite. For the eastern portion of the Site, recommendations were for an ex situ groundwater remediation system, consisting of particle filter and granular activated carbon unit, was recommended to treat groundwater and discharge to the Guelph Sanitary Sewer. The particle filter would remove suspended particles that might contain metals, PAHs, PCBs, and PAHs, and the activated carbon would treat the VOCs. Further groundwater investigations were recommended as the potential for recontamination was likely high.
2010 Annual Groundwater Monitoring Report, Former IMICO Site, 200 Beverly Street, Guelph, Ontario	April 23, 2012	AECOM Canada Limited	The City of Guelph	AECOM (formerly Gartner Lee Limited) has been conducting semi-annual groundwater sampling and quarterly water level monitoring since 1998. The 2010 monitoring events occurred in March, June, October and December with groundwater samples collected in March and October. The groundwater wells in the monitoring well network included those installed offsite on 490 York Road, on Beverley Road, along the CP Rail property and on Simcoe Street, for a total of 18 shallow wells and 13 deep wells. Groundwater flow in the shallow aquifer was determined to be south to southwest, toward the Eramosa River. Deeper groundwater was measured at similar elevations across the site indicating little to no horizontal groundwater flow. LNAPL was measured in OW23 at 0.06 to 0.15m over the four monitoring events. Groundwater chemistry was compared to the Table 2 Standards for industrial/commercial/community property use. Inorganics found exceeding the standards were zinc, chloride and sodium; the chloride and sodium only occuring offsite at the 490 York Road property, likely because of road salting. Zinc was found in six wells, all along the eastern property boundary. PAHs exceeded standards offsite at 490 York Road, and at one location in each the central (OW25) and west (OW16) portion of the Site. PHCs and PCBs were elevated downgradient of the former capacitor room (OW25 and OW26S, respectively) during the 2010 event. The PCB concentration met Table 2 Standards used for comparison, but does not meet current Table 6 Standards. PHCs were also elevated offsite at 490 York Road (specifically F1, differing from the F2-F4 concentrations historically found on the Site) and had not been measured at OW22S or OW23S since 2007. Elevated VOCs included TCE, cis-1,2-DCE, 1,1-DCE, VC, and TCA and were mainly found at the eastern property boundary and on 490 York Road. The highest concentrations of TCE were found offsite at OW30D. Trend analysis indicated that TCE concentrations had mostly stabilized over time, with some wells showing a decreasing trend.

Table 4.1.5-1. Summary of Environmental Reports

Phase One Environmental Site Assessment, 200 Beverley Street, Guelph

Report Title	Date	Author	Prepared for	Description [a]
2011 Annual Groundwater Monitoring Report, Former IMICO Site, 200 Beverly Street, Guelph, Ontario	August 15, 2013	AECOM Canada Limited	The City of Guelph	The 2011 monitoring events occurred in June, September, and December, with sampling occuring in the first two events. Groundwater flow in the shallow aquifer was similar to previous events, deeper groundwater indicated a hydraulic high near OW23D. LNAPL was measured in OW23S at 0.04 to 0.15 m the four events. Groundwater exceedances for inorganics were found for zinc at seven wells and lead in one well. Chlorinated VOCs were similar to concentrations found in 2011, and TCE was noted to be decreasing. PAHs and PHCs were similar to previous years concentrations. PCBs were not analyzed and removed from the program in 2011, despite the last measured concentrations being above Table 6 Standards.
2012 & 2013 Annual Groundwater Monitoring Report, Former IMICO Site, 200 Beverley Street, Guelph, Ontario	March 21, 2014	AECOM Canada Limited	The City of Guelph	The 2012 and 2013 annual report included additional slug test for the offsite wells indicating hydraulic conductivities generally consistent with those measured onsite. Monitoring events reduced to semi-annually and occurred in June and December 2012 and August and October of 2013. Sampling reduced to annually and occurred in December 2012 and October 2013. Groundwater flow in the shallow aquifer was southerly similar to previous events; deeper groundwater indicated a hydraulic high presented near OW18-II. LNAPL was measured in OW23S between 0.03 to 0.08 m over the four events. Pressure transducers were installed in three well nests (OW18, OW27 and OW30) between August 23 and August 31, 2013 (Friday through Saturday) to observe any possible influence of the water takings from nearby wells. No precipication events occured during the period. Water fluctuations were measured in the shallow wells during 2 weekdays: up to 30 cm in OW27S and OW30S and up to 15 cm in OW18-I. Water levels remained steady in bedrock wells OW18-II and OW30D, but fluctuated daily beginning August 26 (Monday). The MOECC stated that Holody Electro Plating has a PTTW for up to 50 imperial gallons per minute, and the water taking occurs continuously during the work week. This pumping is likely affecting the water levels at the Site and may be influencing groundwater flow direction. Groundwater exceedances for inorganics were found for zinc at five wells. Overall, concentrations of chlorinated VOCs were consistent with results from 2011. Degredation products were plotted alongside the TCE concentrations plots. PHC exceedances occured onsite at OW25, OW22S, OW23S (product measured in this well) and offsite at OW36S and OW30D. PAHs were similar to previous years concentrations.
Phase One Environmental Site Assessment 200 Beverley Street, Guelph, Ontario	February 11, 2014	Decommissioning Consulting Services	The City of Guelph	A Phase One ESA was conducted by DCS to assess the existing site environmental conditions and identify environmental concerns that might affect the future use of the Site. A review of historical information including historical reports, aerials, MOECC documents, FIPs, chain of title information, historical databases were completed, as well as a site reconnaissance. Nine APECs were identified by DCS: 1) Fill of Unknown Quality 2) Former UST on the east portion of the Site 3a) Former Iron and Steel Processing including sand mixing and foundry sumps 3b) Former PCB-containing Capacitors in the Foundry 4) Former Metal Treatment, Coating and Finishing 5) Historical Garage, Maintenance and Repair Area on the western property boundary 6) Historical Use and Storage of PCBs in the northeastern portion of the property 7) Former Metal Treatment, Coating and Finishing 8) Chemical Manufacturing, Processing and Bulk Storage (North of the Site) 9) Guelph Rail Line Adjacent to the Site (North of the Site) COCs identified were metals, PHCs, BTEX, PCBs, PAHs, and VOCs. Previous investigations reviewed identified impacts from metals VOCs, PHCs, PAHs, and PCBs. Additional Phase Two work was recommended.
Phase Two Environmental Site Assessment Former IMICO Property 200 Beverley Street, Guelph, Ontario	April 2, 2014	Decommissioning Consulting Services	The City of Guelph	The DCS investigation included excavation of 10 test pits, advancing three boreholes; two of those locations additionally installed a monitoring well. Soil samples were collected for metals, VOCs, PHCs, PAHs, and PCBs. Groundwater samples were collected from the newly installed wells as part of the annual monitoring (AECOM). Groundwater flow was determined to be to the south in the shallow bedrock/overburden, and flow in the deeper bedrock appears to be somewhat radial from the east property boundary. Groundwater velocities in the two units were measured at approximately 15 m/yr and 55 m/yr; an upward gradient was found to be present in some wells. Soil was compared to the MOECC Table 6 Standards and indicated elevated metals across the property and localized exceedances of PAHs and PCBs. Groundwater was found with elevated concentrations mainly on the eastern portion of the Site consiting of VOC, specifically TCE and degredation products, and some PAHs.
Preliminary Remedial Action Plan Former IMICO Property 200 Beverley Street, Guelph, Ontario	April 14, 2014	Decommissioning Consulting Services	The City of Guelph	DCS completed a preliminary remedial action plan for the Site to prepare for its redevelopment. Viable options for soil management included an RA or MGRA in combination with some excavation and offsite disposal. Options for the groundwater were an RA or MGRA with localized free product removal and potential VOC remediation. The source and extent of free product in OW23S would need to also be determined. The presence of offsite impacts were also reported to need further investigation and agreement amoung the City, MOECC, and stakeholders on appropriate remedial measures or management of groundwater impacts.
2014 Annual Groundwater Monitoring Report, Former IMICO Site, 200 Beverly Street, Guelph, Ontario	April 30, 2015	AECOM Canada Limited	The City of Guelph	The 2014 annual monitoring included semi-annual events in July and October with groundwater sampling in October. Wells were re-surveyed accross the Site for top of pipe elevations, with some differences up to 0.45 m from original surveyed elevations, resulting in some minor changes in groundwater flow and hydraulic gradients. Groundwater flow in the shallow aquifer was southerly similar to previous events; deeper groundwater was reported as generally flat with a hydraulic high presented near OW18-II, as previously reported. LNAPL was measured in OW23S between 0.05 to 0.32 m during 2014. Vertical gradients were generally down, with the exception of OW9, OW11, OW30, OW07-34, and OW07-36, which had upwards hydraulic gradients in 2014. Groundwater exceedances for inorganics were found for zinc at four wells. Overall, concentrations of chlorinated VOCs were consistent with results from 2011, indicating TCE decreasing in the shallow aquifer. Degradation products were plotted alongside the TCE concentrations plot and show concentrations increasing in the deeper wells as expected because of downward flow and anaerobic degredation of TCE in bedrock. PHC and PAHs were similar to previous years' results.

Table 4.1.5-1. Summary of Environmental Reports

Phase One Environmental Site Assessment, 200 Beverley Street, Guelph

Report Title	Date	Author	Prepared for	Description [a]
Vertical Delineation of the Extent of Groundwater Impacts at the Former IMICO Site, 200 Beverley Street, Guelph, Ontario	December 8, 2016	WSP Canada Inc.	The City of Guelph	WSP conducted a vertical delineation investigation at the Site to address the concern that over the years concentrations of TCE and related degredation products have been increasing at the northeastern wells. The presence of shalllow porous fractured bedrock (Guelph Formation) has contributed to the migration of TCE and degredation products to deeper depths. The investigation included the installation of a telescopic bedrock monitoring well within an area where identified dense NAPL (TCE and degredation products) were found in the groundwater, in the north east corner of the Site. The well was drilled, cored, and sealed to 29 m, with an open hole left at 29 to 33 m. Geologic features and competent bedrock formations were reported. The Site is underlain by the Lockport Group, consisting of the Guelph Formation, Eramosa Formation, Goat Island Formation, and the Gasport Formation. The Guelph Formation, which is noted to be a major regional aquifer, has a flow from the north to south and discharge points to the Speed and Eramosa Rivers. The Eramosa Formation is considered a regional aquitard and is a semi-confining unit because of vertical and horizontal fractures. The lower portion of this formation (the Vinemount Member) is considered a better aquitard. The region draws water from two major zones: the upper fractured weathered portion of the bedrock and the deeper highly fractured porous Gasport Formation. Groundwater samples were collected during the drilling and run through a handheld gas chromatograph as well as submitted to a lab for PHC and VOC analysis. TCE was found up to approximately 24 m within the Eramosa formation.The highest concentrations of TCE (432 µg/L) and cis-1,2-DCE (244 µg/L) were reported from approximately 9 to 12 m. Degradation products were found in the final investigated depth in the Goat Island Formation above the Table 1 Standards. PHC exceedances were also noted, but were noted to be likely related to the natural presence of hydrocarbons in the Guelph and Eramosa Formations.
2015 Annual Groundwater Monitoring Report, Former IMICO Site, 200 Beverly Street, Guelph, Ontario	January 31, 2017	AECOM Canada Limited	The City of Guelph	The 2015 annual monitoring included semi-annual events in September and November with groundwater sampling in November. Groundwater flow in the shallow aquifer was southerly, similar to previous events; deeper groundwater is reported as generally flat with a hydraulic high presented near OW18-II, as previously reported. LNAPL was measured in OW23S between 0.032 to 0.05 m during 2015 and a total of 650 mL of product was purged from the well over two events. Vertical gradients are generally down, with the exception of upwards gradients observed at one or more events for OW9, OW11, OW26, OW07-34, and OW07-36. Groundwater exceedances for inorganics were found for zinc at five wells. Overall, concentrations of chlorinated VOCs were consistent with results from 2011, indicating TCE decreasing in the shallow aquifer. Degradation products were plotted alongside the TCE concentrations plot and show concentrations increasing in the deeper wells as expected because of downward flow and anaerobic degredation of TCE in bedrock. PHC and PAHs were similar to previous years results.
2016 Annual Groundwater Monitoring Report, Former IMICO Site, 200 Beverly Street, Guelph, Ontario	June 26, 2017	AECOM Canada Limited	The City of Guelph	The 2016 annual monitoring included semi-annual events in August and October with groundwater sampling in October. Groundwater flow in the shallow aquifer was southerly similar to previous events; deeper groundwater is reported as generally flat with a hydraulic high presented near OW30D, where groundwater flows in a northeasterly direction. LNAPL was measured in OW23S between 0.04 and 0.02 m during 2016 and approximately 200 millilitres of product was purged from the well over two events. Vertical gradients are generally down, with the exception of upwards gradients observed at one or more events for OW9, OW11, OW26, OW30, OW07-34, OW07-36, and OW13-39. OW27S/D were not sampled, as there was significant damage to the well casing and PVC pipes by road construction on Simcoe Street. Groundwater exceedances for inorganics were found for zinc at three wells. Overall, concentrations of chlorinated VOCs were consistent with results from 2011, indicating TCE decreasing in the shallow aquifer. Degradation products were plotted alongside the TCE concentrations plot and show concentrations increasing in the deeper wells as expected because of downward flow and anaerobic deredation of TCE in bedrock. PAHs were similar to previous years results. PHCs were similar with the exception of OW22S, OW23D, and OW30D, which had an increase in concentrations.

Notes:

[a] Historical data from previous reports have been summarized in Sections 4.1.5.2 for Soil and Section 4.1.5.3 for Groundwater; Data is also presented on Figures 4-2a through 4-2f for soil, and 4-3a through 4-3f for groundwater.

µg/g = microgram(s) per gram
µg/L = microgram(s) per litre
ACM = asbestos-containing material
APEC = area of potential environmental concern
BTEX = benzene, toluene, ethylbenzene, and xylene
cm = centimetre(s)
COC = contaminant of concern
DCE = dichloroethylene
ESA = environmental site assessment
FIP = fire insurance plan
IMICO = International Malleable Iron Company
LNAPL = light nonaqueous phase liquid
m = metre(s)
m^3 = cubic metre(s)
m/yr = metre(s) per year
mbgs = metre(s) below ground surface
MGRA = modified generic risk assessment
MOECC = Ministry of the Environment and Climate Change, formerly the Ministry of the Environment
NAPL = non-aqueous phase liquid
P&R = Proctor & Redfern
PAH = polycyclic aromatic hydrocarbon
PCB = polychlorinated biphenyl
PHC = petroleum hydrocarbons
PTTW = permit to take water
RA = risk assessment
TCA = trichloroethane
TCE = trichloroethylene
TPH = total petroleum hydrocarbons
UST = underground storage tank
VC = vinyl chloride
VOC = volatile organic compound

Table 7.1-1. Current and Past Land Uses for Phase One Property

Phase One Environmental Site Assessment, 200 Beverley Street, Guelph, ON

Year	Name of Owner	Name of Occupant	Inferred Description of Property Use	Inferred Property Use (according to Regulatory Types)	Other Observations (for example, from Aerial Photograph and Fire Insurance Plans) [1]
1997 - present	City of Guelph	No occupant	Vacant	Industrial	Aerials show the Site buildings demolished between 1998 and 2006 and the Site vacant thereafter
1993 - 1997	The Assembly of the Church of the Universe	The Assembly of the Church of the Universe	Unknown	Institutional/ Industrial	Aerials during this time show damage (assumed from fires) to the buildings on Site
1992 - 1993	John H. Long	John H. Long/Unknown	Storage	Industrial	No additional information available for this time period
1913 - 1992	International Malleable Iron Company Limited	International Malleable Iron Company Limited	Iron-jobbing Foundry	Industrial	Aerials, FIPs show industrial use through this time period; previous reports indicate operations ceased in 1989
1834 - 1913	Various	Owner or unknown	Agricultural or Residential	Agricultural or Residential	Private individuals were listed in the Title Search; no aerials were available before 1930, and no FIP coverage was available for the area prior to 1916

Notes:

[1] Additional information was obtained from the City Directories, Title Search, site observations, interviews and aerial photographs documented in this report.

FIP = fire insurance plan

Table 7.3-1. Areas of Potential Concern

Phase One Environmental Site Assessment, 200 Beverley Street, Guelph, Ontario

Areas of Potential Environmental Concern (APEC) ID		Location of APEC	Potentially Contaminating Activity (PCA)[1]		Location of PCA [2]	Contaminants of Potential Concern (based on AP method groups) [3]	Media Potentially Impacted (groundwater and/or soil)
APEC-1	Foundry - A foundry was operated on the site by IMICO from 1913 to 1989 when the plant closed and was abandoned. The foundry operated as an iron-jobbing facility for the production of various metallic forms using malleable and ductile iron (DCS, 2014). Foundry sands were predominantly located in the concrete pits and sumps of the main Foundry building. Foundry sands, sludge materials, and process waste were removed from the site and buildings were demolished in 1999 (Earth Tech, 1999). The P&R investigation also reported that moulding sands and dust collector waste was stored at the north west corner of the building and drained to the truck bay (P&R, 1991).	Central portion of the Site	32	Iron and Steel Manufacturing and Processing	Onsite	VOCs, PHCs, PAHs, ABNs, CPs, metals	Soil and Groundwater
APEC-2	Machine Shop - A machine shop was shown on the 1916 FIP, east of the original foundry. The northern one-third of the Machine Shop was identified for 'Tumbling and Cleaning' operations, inferred to be in association with the adjacent 'Annealing Room' to the north. FIPs prepared in 1929, 1945 and 1960 showed this area changed operations to 'Shipping' and a 'Pattern Shop'.	East end of the Site	34	Metal Fabrication	Onsite	VOCs, PHCs, PAHs, metals	Soil and Groundwater
APEC-3	Annealing - An 'Annealing Room' with four furnaces is shown on the 1916 FIP. A brick chimney is located on the north wall. The 1929 FIP shows nine furnaces with the Annealing Room extended westward with an additional chimney on the north wall within the extended area; the southern portion of the Annealing Room is identified as the 'Tumbling Dep't'. The 1946 FIP shows a structural addition on the east side of the Annealing Room, with two additional furnaces. The 1960 FIP shows further eastward expansion and the addition of a third furnace. Tumbling Dep't operations appear consistent in location and footprint, from 1929 through to 1960. The furnaces are inferred to be coal fired from 1916 through to 1960, based on the nearby coal storage areas shown on the 1946 and 1960 FIPs, and the absence of ASTs or USTs for fuel oil storage on any of the FIPs. The furnace fuel from after 1960 to the end of operations in 1989 is not known, but a period of fuel oil fired operation of the furnaces is suspected; see APEC 7. No information was identified to suggest coal or fuel oil storage within the Annealing Room; however, no information regarding temporary furnace fuel storage, transmission or waste disposal was identified. Dust control equipment is shown on Figure 4 of the 1991 P&R report, on the north side of the Annealing Room.	East end of the Site	32	Iron and Steel Manufacturing and Processing	Onsite	VOCs, PHCs, PAHs, metals	Soil and Groundwater
APEC-4	Sand Storage - The 1916 FIP shows a 'Sand Shed'. The 1929 and 1946 FIPs again show the Sand Shed, plus a second smaller building to the west labelled 'Sand'. The 1960 FIP shows the original 'Sand Shed' as 'Bricks' and the second smaller building to the west labelled as 'Sand & Bricks', and an additional area to the north labeled 'Sand'. No information was identified to if only clean process, spent foundry sands or both were stored in these buildings, therefore the potential storage of spent foundry sand in these buildings is considered. The purpose and types of bricks stored was not identified. The potential for new and used refractory brick and associated process materials is considered possible.	Central portion of the Site	32	Iron and Steel Manufacturing and Processing	Onsite	PAHs, ABNs, CPs, metals	Soil and Groundwater
APEC-5	Galvanizing Building - A small free standing building for 'Galvanizing' was present on the south east portion of the Site as shown on the 1916, 1929 and 1946 FIPs. The Galvanizing building was not shown on the 1960 FIP, with the area occupied by a larger new structure identified as 'Fittings Whse' (warehouse). No information was identified regarding process chemical use and storage, or waste management practices, in association with the galvanizing operations conducted.	Southeast end of the Site	33	Metal Treatment, Coating, Plating and Finishing	Onsite	VOCs, PHCs, PAHs, metals	Soil and Groundwater
APEC-6	Chipping/Grinding Room - A 'Chipping Room' was shown on the FIPs prepared in 1929, 1946 and 1960, located west of the Annealing area. The 1916 FIP shows this as exterior yard area west of the 'Annealing Rm', with a small outbuilding that appears to be connected to the Annealing Room with a linear underground feature. The 1991 P&R report identified this as a 'Trimming and Grinding' area; this information inferred to be based on the interview of historical IMICO employees. 'Dust control equipment' is shown on Figure 4 of the 1991 P&R report, on the exterior west side of the building.	Central portion of the Site	34	Metal Fabrication	Onsite	Metals	Soil and Groundwater
APEC-7	Oil Houses, Boiler House and ASTs - A building is shown on the 1929 FIP to the north of the Foundry and east of the power house with a label "Oil", and an additional building with the same label is shown to the north of this original building on the 1946 FIP. The 1960 FIP shows the north building remaining, but is not labeled as an oil house. The 1916 FIP shows this as empty exterior yard area north of the foundry. The P&R Investigation figures show a boiler house to the east of the power house, and two 45,000-L (10,000 gallon) oil tanks to the east of the building with "no history of leaks or spills" (P&R, 1991). One 45,000-L AST was reported removed in 1998 during demolition activities and had been used to store Bunker C fuel. The AST removed had been located east of the Core Room (Earth Tech, 1999).	Central portion of the Site	28	Gasoline and Associated Products Storage in Fixed Tanks	Onsite	BTEX, PHCs	Soil and Groundwater

Table 7.3-1. Areas of Potential Concern

Phase One Environmental Site Assessment, 200 Beverley Street, Guelph, Ontario

	Areas of Potential Environmental Concern (APEC) ID	Location of APEC	Potentially Contaminating Activity (PCA)[1]		Location of PCA [2]	Contaminants of Potential Concern (based on AP method groups) [3]	Media Potentially Impacted (groundwater and/or soil)
APEC-8	Gasoline UST - As indicated on the 1960 FIP, a gasoline UST is shown north of a small office building, and west of 'scales' at the corner of Kingsmill Avenue and Beverley Street. The area is empty exterior yard area on the 1916 FIP, and the 1929 and 1946 FIPs show the office (labeled as a 'time office'), but does not show the UST. The gasoline use is not known, however it is inferred to be for fueling gasoline-powered equipment/vehicles used at the plant. The 1991 Proctor & Redfern investigation reported that an IMICO employee indicated the UST was removed in the mid-1980s in response to a request from the City due to gasoline vapours in the sewers along Beverley and York Streets. No significant contamination was reported (P&R, 1991).	Southeast end of the Site	28	Gasoline and Associated Products Storage in Fixed Tanks	Onsite	VOC, PHCs, PAHs, metals	Soil and Groundwater
APEC-9	Oil House - A building is shown on the 1929 and 1949 FIP to the south of the Foundry and west of the galvanizing building with a label "Oil". The building/structure is not on 1916 FIP where the area is shown as exterior yard area, and is not present on the 1960 FIP where the area is occupied.	Southeast end of the Site	28	Gasoline and Associated Products Storage in Fixed Tanks	Onsite	BTEX, PHCs	Soil and Groundwater
APEC-10	Machine Shop - A machine shop is shown on the 1929, 1946 and 1960 FIP, east of the original foundry building. The floor is indicated as concrete. Machine shop cuttings were stored on the ground north of the building, and two small ceiling mounted oil tanks were present in the building as noted in the P&R investigation (1991). The area is shown on the 1916 FIP as exterior yard area, with a small unidentified building in the central area of the future machine shop.	East end of the Site	34	Metal Fabrication	Onsite	VOCs, PHCs, PAHs, metals	Soil and Groundwater
APEC-11	Plating/Galvanizing Building - A galvanizing building was present on the Site as shown on the 1946 and 1960 FIP. The previous FIPs (1916 and 1929) show this as exterior yard area. On subsequent site plans (P&R, 1991; Earth Tech 1999), the building was identified as a storage shed and reported as having been used for dip galvanizing before 1975, with rinse water discharged into "dry wells" north of the building (P&R, 1991). Investigations by P&R and Gartner Lee indicated high concentrations of zinc, other metals, and oil & grease. Free product was observed wells (OW01-I, OW20, OW21). The area was excavated to bedrock (ranging from 1.3 to 2.0 mbgs and approximately 9,400 tonnes of contaminated soil and 925 tonnes of contaminated concrete were removed. Soil samples were collected from the final limits of the excavation walls and indicated most locations having zinc and TPH concentrations above the Table A Guidelines. The excavation was backfilled with granular "B" materials. A single sample was collected from the backfill and met the guidelines applicable at the time of the report (Earth Tech, 1999). A well nest (OW22S/D) was installed within the excavation area (the report for this installation was not available and therefore the soil conditions are unknown if analyzed as part of the investigation). Testpits and boreholes installed in the area in 2013 by DCS indicated soils having high zinc and other metal concentrations. Groundwater conditions at OW22S reported free product which was highly weathered with a slight oil/diesel odour (as reported in the summary of the Gartner Lee 2000/2001 investigation in DCS, 2007a). Borehole logs for OW22S/D indicate the presence of fuel/diesel type odour in the fill which extends to approximately 1.5 mbgs; and hydrocarbon odour extending into the underlying bedrock with black staining on fractures. Groundwater sampled from OW22S has not since reported free product, but has had concentrations of PHCs increasing since the annual monitoring at this location began in 2016, up to 850,000 ug/L of F3. Zinc concentrations have widely fluctuated over the years and have exceeded in approximately 25% of the sampling events between 2005 and 2016.	Northeast end of the Site	33	Metal Treatment, Coating, Plating and Finishing	Onsite	VOCs, PHCs, PAHs, metals	Soil and Groundwater
APEC-12	Coal Storage - A coal shed is shown on the 1946 FIP, to the north of the foundry and west of the powerhouse. A larger coal storage area is shown on the 1960 FIP, and the building is extended south to connect with the foundry on subsequent site plans (P&R, 1991; GLL, 1999; Earth Tech 1999) without an indication of its use. The previous FIPs (1916 and 1929) show this area as exterior yard area.	Central portion of the Site	8	Chemical Manufacturing, Processing and Bulk Storage	Onsite	PAHs	Soil and Groundwater
APEC-13	Rail Line - A former rail line was shown onsite north of the buildings on the 1916, 1929 and 1946 FIPs, running east to west, for the full length of the foundry building. On the 1960 FIP, the western portion was shown to have been removed, to accommodate the newly constructed shipping/stock room; the rail siding ended at the eastern side of the building. It is inferred that raw materials and finished products were shipped by rail.	Central to northeast end of the Site	46	Rail Yards, Tracks and Spurs	Onsite	PAHs, metals	Soil and Groundwater
APEC-14	Possible Automobile Storage, Maintenance and Repair - An addition south of the foundry building, on the east side of the offices, is labeled "Auto" on the 1960 FIP. Previous FIPs (1916, 1929, 1946) show this as exterior yard area.	South end of the Site	27	Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation Vehicles	Onsite	VOCs, PHCs, PAHs, metals	Soil and Groundwater
APEC-15	Sand Mixing/Storage - Sand mixing is shown in a building north of the foundry as shown on the 1960 FIP. Previous FIPs (1916, 1929, 1946) show this as exterior yard area, north of the foundry. Subsequent site plans (P&R, 1991; GLL, 1999; Earth Tech 1999) do not have an indication of the buildings use.	Central portion of the Site	8	Chemical Manufacturing, Processing and Bulk Storage	Onsite	PHCs, PAHs, ABNs, CPs, metals	Soil and Groundwater

Table 7.3-1. Areas of Potential Concern

Phase One Environmental Site Assessment, 200 Beverley Street, Guelph, Ontario

	Areas of Potential Environmental Concern (APEC) ID	Location of APEC	Potentially Contaminating Activity (PCA)[1]		Location of PCA [2]	Contaminants of Potential Concern (based on AP method groups) [3]	Media Potentially Impacted (groundwater and/or soil)
APEC-16	Transformers - Transformers are first shown on the 1960 FIP, north of the powerhouse. Previous FIPS (1916, 1929, 1946) show this as exterior yard area north of the power house. Transformers of this era may have contained PCBs.	Central portion of the Site	55	Transformer Manufacturing, Processing and Use	Onsite	PHCs, PCBs	Soil and Groundwater
APEC-17	Capacitor Room - PCB-containing capacitors were present in the centre of the foundry, as first shown on the P&R investigationsite plan, and later remediated as part of the Earth Tech demolition (P&R, 1991; EarthTech, 1999). Activities included removal of a concrete floor, a utility trench located in the eastern section (concrete walls, granular base) that was heavily stained, a subfloor was present in the central section, and a sump located in on the eastern portion of the capacitor room that were all indicated as PCB-impacted and excavated and disposed offsite. The area was excavated to bedrock (1.0 - 1.3 mbgs) to remove concentrations above 5 ug/g. Final samples (composite soil, soil, concrete and bedrock) from the limits of excavation in the capacitor room reported PCB concentrations under 5 ug/g, with the exception of two bedrock samples within the eastern sump area that had concentrations around 10 ug/g. A well (OW25) was installed within the excavation area (the report for this installation was not available and therefore the soil conditions are unknown if analyzed as part of the investigation) and subsequent groundwater monitoring of the area have indicated concentrations of chlorinated VOCs and PHCs (mainly F3) above the applicable potable water criteria (Table 6 Standards) (DCS, 2007b, 2014b; AECOM, 2017a and 2017b).	Central portion of the Site	55	Transformer Manufacturing, Processing and Use	Onsite	PCBs, PHCs	Soil and Groundwater
APEC-18	Coal Storage - A building for coal storage is shown on the 1960 FIP, to the north of the annealing room, with additional 'coal piled' to the west of the building. Previous FIPs (1916, 1929, 1946) show this as exterior yard area to the north of the annealing room. The coal is inferred to be used in the furnaces in the annealing room. Subsequent site plans show this as a storage area (P&R, 1991, DCS, 2007a).	Northeast end of the Site	8	Chemical Manufacturing, Processing and Bulk Storage	Onsite	PAHs	Soil and Groundwater
APEC-19	Coal Storage - A small building for coal storage is shown on the 1960 FIP, east of the time keepers office at the Beverley Street entrance. The building is not present on previous FIPs (1916, 1929, 1946) and is shown as exterior yard area.	Southeast end of the Site	8	Chemical Manufacturing, Processing and Bulk Storage	Onsite	PAHs	Soil and Groundwater
APEC-20	Garage - A garage was shown on the 1946 and 1960 FIP along Stevenson, on the west side of the property. The building is not present on previous FIPs (1916, 1929) and is shown as exterior yard area. The site investigation by P&R (1991) identified visual impacts to the soils south of the garage. Some elevated PCB concentrations were found in soil during subsequent investigations.	West end of the Site	27	Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation Vehicles	Onsite	VOCs, PHCs, PAHs, metals, PCBs	Soil and Groundwater
APEC-21	Coal Storage - The 1960 FIP indicates coal storage south of the garage on the west side of the Site. The building is not present on previous FIPs (1916, 1929) and is shown as exterior yard area, and on the 1946 FIP, the building is not labeled as coal.	West end of the Site	8	Chemical Manufacturing, Processing and Bulk Storage	Onsite	PAHs	Soil and Groundwater
APEC-22	Transformer - A 1200-volt transformer is shown on the 1991 Site Plan (P&R, 1991).	Southwest end of the Site	55	Transformer Manufacturing, Processing and Use	Onsite	PHCs, PCBs	Soil and Groundwater
APEC-23	Paint Shop - First shown on the P&R Site plan, a paint shop was located at the north end of the site, between the shipping building and the storage area (P&R, 1991). Drums were stored against the north wall for materials used in the paint shop. The FIPs show this area as exterior yard area in the early FIPs (1916, 1929, 1946) and empty space between existing buildings in the 1960 FIP.	Northeast end of the Site	39	Paints Manufacturing, Processing and Bulk Storage	Onsite	VOCs, PHCs, PAHs, metals	Soil and Groundwater
APEC-24	PCB Storage Area - An area located at the northeast corner of the finishing and annealing room, with a concrete pad was identified in the Earth Tech investigation as a former PCB Storage area. Concentrations above 50 ppm of PCBs were identified. Previous site maps showed this area as 'storage' (P&R, 1991) or part of the Annealing Room (1946 and 1960 FIPs). During the demolition activities, approximately 250 kg of PCB-containing ash residue from the top of the concrete pad, and the concrete pad itself was removed and taken for offsite disposal (Earth Tech, 1999). Confirmatory samples below the pad were 0.63 and <0.05 ug/g. The soil was later excavated to bedrock as part of the soil remediation in the northeast corner of the property (see APEC-11).	Northeast end of the Site	55	Transformer Manufacturing, Processing and Use	Onsite	PHCs, PCBs	Soil and Groundwater
APEC-25	Drum Storage - Interviews with former employees as part of the P&R investigation identified drum storage activities which occurred along the north property boundary (P&R, 1991). No additional information was provided on the nature of what was stored and whether there was any associated contamination as a result of the materials.	North end of the Site	8	Chemical Manufacturing, Processing and Bulk Storage	Onsite	VOCs, PHCs, PAHs, metals	Soil and Groundwater

Table 7.3-1. Areas of Potential Concern

Phase One Environmental Site Assessment, 200 Beverley Street, Guelph, Ontario

Areas of Potential Environmental Concern (APEC) ID		Location of APEC	Potentially Contaminating Activity (PCA)[1]		Location of PCA [2]	Contaminants of Potential Concern (based on AP method groups) [3]	Media Potentially Impacted (groundwater and/or soil)
APEC-26	Former Substation - A former substation is indicated on the P&R (1991) and Earth Tech (1999) site plans. A sample of transformer oil from the former substation analyzed in the Earth Tech report indicated non-detect concentrations of PCBs. Similarly one location installed during the DCS Phase II ESA (2007) indicated non-detect PCB concentration. Previous site plans (FIPs) show this area as exterior yard areas.	West end of the Site	55	Transformer Manufacturing, Processing and Use	Onsite	PHCs, PCBs	Soil and Groundwater
APEC-27	Former Electrical Shop - A small electrical shop was noted to be on the southwest corner of the foundry (P&R, 1991). This addition was not shown on the FIPs from previous years, and was shown as the exterior yard area west of the foundry.	Southwest end of the Site	34	Metal Fabrication	Onsite	VOCs, PHCs, PAHs, metals	Soil and Groundwater
APEC-28	Waste Oil Storage - Used oil was stored above ground on the southwest end of the foundry as shown on the P&R Site Plan (P&R, 1991).	Southwest end of the Site	28	Gasoline and Associated Products Storage in Fixed Tanks	Onsite	VOCs, PHCs, PAHs, metals	Soil and Groundwater
APEC-29	Fill of Unknown Quality - All areas of the Site have a layer of fill above the native silty sands. Previous investigations have indicated a layer of fill consisting of foundry sands, slag and cinders (up to 1.0 m) was found across the site (P&R, 1991) and the fill to be mix of foundry operation waste such as "coal, clinker, ash, metals and detritus from the former foundry operations" and reworked native from "reworking onsite soils as a result of initial construction and subsequent expansion activities" (DCS, 2007b). The yard areas were additionally noted to have been oiled (presumably engine oil) (P&R, 1991).	Entire Site	30	Importation of Fill Material of Unknown Quality	Onsite	BTEX, PHCs, PAHs, ABNs, CPs, metals, PCBs	Soil and Groundwater
APECs from Offsite PCAs to the North							
APEC-30 (Offsite North)	Rail Lines - Bordering the north side of the Site, rail lines are present (owned by Guelph Rail Line) and have existed since at least the early 1900s. Has historically been indicated as the Canadian Pacific Railway (1916, 1929, 1946, 1960 FIPs and P&R [1991]), Guelph Junction Railway (EarthTech, 1999; DCS, 2007a).	Along Northern Property Boundary	46	Rail Yards, Tracks and Spurs	Offsite	VOCs, PHCs, PAHs, ABNs, CPs, metals	Groundwater
	Paper Manufacturing - Companies at 309 Elizabeth Street have been listed in the Scott's Manufacturing Directory for paper related manufacturing: Trinity Graphics was established in 1977 and 1978 with a plant sizes of 3,000 and 50,000 m^3 for paper bag and coated and treated paper manufacturing, all other converted paper product manufacturing, platemaking and related services; Independent Paper Converters was established in 1978 with a plant size of 56,000 m^3 for manufacturing including paper bag, coated and treated paper, plastic film and sheet. The 1960 FIP indicated gummed paper manufacturing (Top Paper Products).	309 Elizabeth Street	45	Pulp, Paper and Paperboard Manufacturing and Processing	Offsite		Groundwater
	Auto Body Repair Shop - An automobile wrecking and recycling record was listed in the ERIS report for Sutton Auto Collision at 349 Elizabeth Street, which is an autobody repair facility. Additionally Top Gun Auto Painting & Collision is listed at this address from the City Directory.	349 Elizabeth Street	10	Commercial Autobody Shops	Offsite		Groundwater
	Automobile Repair - Two automotive repair shops are listed in the City Directory at 349 Elizabeth Street from approximately 2005.	349 Elizabeth Street	27	Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation Vehicles	Offsite		Groundwater
	Gasoline Station - A private fuel outlet with a 2,250 L liquid fuel double walled AST for gasoline is listed in the ERIS report for Oaks Precast Ind. Div. Standard Ind. at 351 Elizabeth Street with a license issue date of 1990. An additional record indicates a tank capacity of 36,500 L.	351 Elizabeth Street	28	Gasoline and Associated Products Storage in Fixed Tanks	Offsite		Groundwater
	Trucking Company - A general freight trucking company (Polymer Distribution Inc.) is listed at 351 Elizabeth Street.	351 Elizabeth Street	11	Commercial Trucking and Container Terminals	Offsite		Groundwater
	Concrete Products Manufacturing - Lafarge Canada Inc. is listed at 351 Elizabeth Street, with a Scott's Manufacturing directory listing indicating an established date of 1933 and plant size of 50,000 ft^3.	351 Elizabeth Street	12	Concrete, Cement and Lime Manufacturing	Offsite		Groundwater
	Plastic Products Manufacturing - ERIS and the City Directory searches indicate plastic products manufacturing at 53 Victoria Rd S. Scott's Manufacturing directory listings indicate Sterling Creations was established in 1983 with a 5,000 ft^2 plant size, as well as Clear Choice Window Manufacturing established in 1990 with a 1,600 ft^2 plant size.	53 Victoria Rd S	43	Plastics (including Fibreglass) Manufacturing and Processing	Offsite		Groundwater
	Wire/Spring Manufacturing - ERIS searches list records for Guelph Wire Products which was established in 1974, plant size of 4,000 ft^2 and manufactures steel springs, wire springs and miscellaneous fabricated wire products.	53 Victoria Rd S	34	Metal Fabrication	Offsite		Groundwater
	Metal Valve Manufacturing - ERIS searches list records for DeNardis Industrial Sales Ltd. at 61 Victoria Rd S Unit C for metal valve manufacturing, established in 1985, plant size 4000 ft^2.	61 Victoria Rd S	34	Metal Fabrication	Offsite		Groundwater
	Former Spill - Spill records from ERIS indicated a release of diesel fuel in 2005 at 65 Victoria South.	65 Victoria Rd S			Offsite		Groundwater
	Electro-plating company - Holody Electro-Plating Limited is listed at 66 Victoria associated with metal product coating, iron and steel mills and ferro-alloy manufacturing since at 1955, with a plant size of 40,000 ft^2 according to available records from ERIS. The 1960 FIP showed labeled buildings for plating, polishing, and an office.	66 Victoria Rd S	33	Metal Treatment, Coating, Plating and Finishing	Offsite		Groundwater

Table 7.3-1. Areas of Potential Concern

Phase One Environmental Site Assessment, 200 Beverley Street, Guelph, Ontario

	Areas of Potential Environmental Concern (APEC) ID	Location of APEC		Potentially Contaminating Activity (PCA)[1]	Location of PCA [2]	Contaminants of Potential Concern (based on AP method groups) [3]	Media Potentially Impacted (groundwater and/or soil)
	Window and Door Manufacturing - Clear Choice Window Manufacturing Inc. and Richview Doors Ltd are listed in the Scott's Manufacturing Directory; established in 1990, and a 1,600 ft plant size. A spill at 75 Victoria Road South of a polymer emulsion (100lbs) in 2016 was reported.	75 Victoria Rd S	43	Plastics (including Fibreglass) Manufacturing and Processing	Offsite		Groundwater
	Scrap Yard - B&F Scrap Dealers are listed at 100 Victoria Road South, with an automobile wrecking and recycling record in ERIS and listings in the city directory search from 1970 to 2011. A spill was reported at the property of a gasoline and water mixture (quantity not specified) in 2006 from cargo leaking to the ground.	100 Victoria Rd S	49	Salvage Yard, including automobile wrecking	Offsite		Groundwater
APECs from Offsite PCAs to the East							
APEC-31 (Offsite East)	Steel Valve Manufacturing - Guelph Engineering Co. was shown located at 10 Kingsmill Avenue, buildings on the 1960 FIP indicate steel valve manufacturing with a machine shop, pattern shop and oil house. Previous FIPs (1916, 1929 and 1946) show residences in this area.	10 Kingsmill Avenue	32	Iron and Steel Manufacturing and Processing	Offsite	VOCs, PHCs, PAHs, ABNs, CPs, metals, PCBs	Groundwater
	Former Stove Manufacturer/Foundry - Guelph Stove Company was shown at 490 York Road on the 1916, 1929, 1946 and 1960 FIPs. Buildings included a foundry, storage (coke, coal, sand), milling room, pattern shops, plating and buffing, offices, warehouses, steel mounting room & blacksmith, crating, stove mounting, and oil. Transformers are shown on the enamel building. Operations existed until approximately the mid-1960s where the city directory listings indicate Franklin Manufacturing Co (Canada) LTD and then Resco Refrigeration Supplies Co LTD from approximately 1970. The facility became a multi-tenant commercial companies from the 1990s to present.	490 York Road	32	Iron and Steel Manufacturing and Processing	Offsite		Groundwater
	Box Manufacturing - Packing manufacturers are listed at 136 Victoria Road South: Ellis Packing West Inc. listed as a corrugated and solid fibre box manufacturer; and ABCO Box and Carton Ltd. listed as a folding paperboard box manufacturer, established in 1946 with a plant size of 40,000 ft^2. The 1960 FIP shows ABCO Box and Carton Co. Ltd with buildings labeled for office, pattern making, cutting, raw stock, stripping, gluing and finished stock. ABCO was present until approx. 2000 when Ellis Packing West replaced them as listed in the city directory.	136 Victoria Rd S	45	Pulp, Paper and Paperboard Manufacturing and Processing	Offsite		Groundwater
	Potential USTs - On the 1960 FIP, McGregor Sportswear of Canada was shown to have 2 fuel oil USTs (2,500 gal each) on the property at 136 Victoria Rd S.	136 Victoria Rd S	28	Gasoline and Associated Products Storage in Fixed Tanks	Offsite		Groundwater
	Scrap Yard - Joe Brown & Son Ltd, a junk yard, is shown on the 1960 FIP at 150 Victoria; ERIS records include Hendersons Disposal Systems Ltd as the owner, and list the facility as a transfer service from 2000 to 2004, and 2005 as an Ontario numbered company.	150 Victoria Rd S	49	Salvage Yard, including automobile wrecking	Offsite		Groundwater
	Former Fuel Storage Facility - Multiple companies have been listed at 154 Victoria Rd S (Shell Canada Products, Doug Pollock Fuels Ltd, Granger Fuels) as an expired TSSA fuel storage facility with gasoline and diesel. A spill was reported in 1988 due to container overflow of 150 L of gasoline to the gravel surface. The 1946 FIP shows 6 gasoline USTs, and the 1960 FIP shows 13 gasoline USTs and an oil warehouse; both listed as Canadian Oil Companies Ltd.	154 Victoria Rd S	28	Gasoline and Associated Products Storage in Fixed Tanks	Offsite		Groundwater
	Former Paint Application - A cabinet manufacturer was shown on the 1960 FIP, Gilson Manufacturing Co. Ltd. Cabinet Division at 57 Victoria Rd S with buildings labeled for steel storage, tubing room, steel room, washer, dryer, office, paint spray, transformer.	53 Victoria Rd S	39	Paints Manufacturing, Processing and Bulk Storage	Offsite		Groundwater
	Chemical Manufacturer or Distributor - Robert On Guard Products was listed in the chemical facilities records.	490 York Road	8	Chemical Manufacturing, Processing and Bulk Storage	Offsite		Groundwater
	Transformers - The National PCB records list up to 7 transformers on 490 York Road associated with Sherwood Forest Investments (formerly Hamril Investments). The volumes listed total approximately 1,600 L. Transformers (7 total) are shown on the 1960 FIP on the enameling building of Guelph Stove Co. Ltd.	490 York Road	55	Transformer Manufacturing, Processing and Use	Offsite		Groundwater
APECs from Offsite PCAs to the South							
APEC-32 (Offsite South)	Screw Manufacturing - Linread Canada Ltd. is shown on the 1960 FIP as a screw manufacturer, and is listed in ERIS reports as a industrial fastener at 24 Hayes with records until 1998. "Jet" is listed as a manufacturer of metal dies at this location with records between 1993 and 1998. Multiple Scott's Directory listings are reported for this address for machinery/equipment/ industrial fan and fabricated metal tools/product manufacturing (Daltec Industries, Allen Simpson Marketing and Design) with established dates of 1984 and 1975, and records up to 2006. A spill was reported of slurry to the road in 2014.	24 Hayes	34	Metal Fabrication	OffSite	VOCs, PHCs, PAHs, metals	Groundwater
	Former USTs - One gasoline UST is shown on the 1960 FIP on the south side of the building at Traders' Plumbing and Heating Supplies Limited at 150 Stevenson Street South.	150 Stevenson St S	28	Gasoline and Associated Products Storage in Fixed Tanks	OffSite		Groundwater
	Former Transportation Company - The 1960 FIP indicates a transportation company (Direct Winter's Transport) at 101 Beverley and city directories the company was present from the early 1950s to 1960s.	101 Beverley Street	11	Commercial Trucking and Container Terminals	Offsite		Groundwater

Table 7.3-1. Areas of Potential Concern

Phase One Environmental Site Assessment, 200 Beverley Street, Guelph, Ontario

	Areas of Potential Environmental Concern (APEC) ID	Location of APEC		Potentially Contaminating Activity (PCA)[1]	Location of PCA [2]	Contaminants of Potential Concern (based on AP method groups) [3]	Media Potentially Impacted (groundwater and/or soil)
APECs from Offsite PCAs to the West							
APEC-33 (Offsite West)	Window Manufacturing - Clear Choice Window Manufacturing Inc. is listed in the Scott's Manufacturing Directory; established in 1990, and a 1,600 ft plant size.	145 Stevenson St S	43	Plastics (including Fibreglass) Manufacturing and Processing	Offsite	VOCs, PHCs, PAHs, metals	Groundwater
	Metal Treatment - Choice Enterprises is listed in the Scott's Manufacturing Directory; as coating, engraving, heat treating, and allied activities; established in 1998.	147 Stevenson St S	33	Metal Treatment, Coating, Plating and Finishing	Offsite		Groundwater
	Spring Manufacturing - ERIS records indicate heavy gauge spring manufacturing at 60 Johnston Street as Steele Bros. Ltd., the Scott's manufacturing directory record indicates the company was established in 1986 with a plant size of 6,500 ft^2. The 1960 FIP shows the H.I. Thompson Co. of Canada Limited (Aircraft Insulation) with a factory, spring room, spray room, transformer, and cement storage.	60 Johnston Street	34	Metal Fabrication	Offsite		Groundwater
	Former Refractory Facility - Former Foundry Services of Canada (FOSECO) facility operated at 201 Alice Street until approximately the late 1990s, had a known contaminated plume in the shallow groundwater occurring at the bedrock/overburden interface, migrating northward and a groundwater treatment system for toluene (P&R, 1991). A certificate of approval record was issued in 1989 to Foseco for the toluene stripper for groundwater. The 1960 FIP indicates the following buildings: tablet making, lab, shipping, mixing, warehouse, ball mill, elevator, transformer, oil storage, blending, mouldable exothermic feeding compound, incinerator.	201 Alice Street	34	Metal Fabrication	Offsite		Groundwater
	Motor Vehicle Parts Manufacturing - BP Canada Energy Company is listed in ERIS operating at 201 Alice Street.	201 Alice Street	57	Vehicles and Associated Parts Manufacturing	Offsite		Groundwater
	Former Spill - A spill was reported at the corner of Alice and Stevensons Street of 15 L of windshield washer fluid and antifreeze to a catch basin a motor vehicle accident in 2016.	Stevenson and Alice Street	27	Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation Vehicles	Offsite		Groundwater

Notes:

1 PCA – potentially contaminating activity (as defined by O.Reg. 153/04)

2 Refer to Figure 7-1 for PCA locations

3 As noted in the "*Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act* " March 9, 2004, amended as of July 1, 2011.

% = percent

"-" = Unknown or data not readily available for review
< = less than
ug/g = microgram per gram
ug/L = microgram per litre
% = percent
APN = Acid Base Neutral compounds
APEC = Area of Potential Environmental Concern
AST = Aboveground storage tank
BTEX = Benzene, toluene, ethylbenzene, and xylenes

CDL = City Directory Listings
CP = Chlorophenols
ELE = EcoLog ERIS Database Search
FIP = Fire insurance plan
ft = foot
ft^2 = square foot
ft^3 = cubic foot
HER = Historical Environmental Reports
ID = Identification

mbgs = metres below ground surface
kg = kilogram
L = litre
lb = pound
m = metre
m^3 = cubic metres

MOECC = Ontario Ministry of the Environment and Climate Change
offsite = Within Phase One Study area, outside the Phase One Property
onsite = Phase One Property

P&R = Proctor & Redfern

PAH = Polycyclic aromatic hydrocarbon
PCA = Potentially contaminating activity
PCB = Polychlorinated biphenyl
PHC = Petroleum hydrocarbon
UST = Underground storage tank
VOC = Volatile organic compound

Table 7.4-1. Phase One Conceptual Site Model

Phase One Environmental Site Assessment, 200 Beverley Street, Guelph, ON

Phase One CSM Element	Summary
Existing Buildings and Structures	No buildings or structures
Identify Water Bodies in the Phase One Study Area	Waterbodies within the Phase One Study area include a portion of the Hanlon Creek and Mill Creek Swamp located off Site, but in the south/central portion of the Phase One Study Area as shown on Figure 2-1.
Areas of Natural Significance	No identified areas of natural significance are located wholly or partly within the Phase One Study Area.
Presence of Drinking Water Wells	No drinking water wells were identified on the Phase One Property. Thirty water wells are located within the Phase One Study Area as shown on Figure 4-4.
Identify Roads within the Phase One Study Area	Figure 6-1 presents the roadways and land use within the Phase One Study Area.
Adjacent Property Uses	Figure 6-1 presents the current adjacent property use: • To the north: residential, industrial and commercial • To the east: residential, industrial and commercial • To the south: residential, industrial and commercial • To the west: residential
Identify PCAs in the Phase One Study Area	The following PCA types were found in the Phase One Study Area: • 8 – Chemical Manufacturing, Processing and Bulk Storage • 10 - Commercial Autobody Shops • 11 - Commercial Trucking and Container Terminals • 12 - Concrete, Cement and Lime Manufacturing • 27 – Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation Vehicles • 28 – Gasoline and Associated Products Storage in Fixed Tanks • 30 – Importation of Fill Material of Unknown Quality • 32 – Iron and Steel Manufacturing and Processing • 33 – Metal Treatment, Coating, Plating and Finishing • 34 – Metal Fabrication • 37 - Operation of Dry Cleaning Equipment (where chemicals are used) • 39 – Paints Manufacturing, Processing and Bulk Storage • 45 - Pulp, Paper and Paperboard Manufacturing and Processing • 46 – Rail Yard, Tracks and Spurs • 47 – Rubber Manufacturing and Processing • 49 - Salvage Yard, including automobile wrecking • 54 - Textile Manufacturing and Processing • 55 – Transformer Manufacturing, Processing and Use • 57- Vehicles and Associated Parts Manufacturing Table 7.2-1 summarizes the details of the PCAs identified in the Phase One Study area, and locations are shown on Figure 6-1.
Identify APECs	Thirty-three (33) APECs are identified for the Phase One Property.

Table 7.4-1. Phase One Conceptual Site Model

Phase One Environmental Site Assessment, 200 Beverley Street, Guelph, ON

Phase One CSM Element	Summary
COPCs	The COPCs identified within the Phase One Study Area include metals and inorganics, VOCs, PHCs, PAHs, PCBs, ABNs and CPs. This list includes COPCs that are confirmed to be present based on historical investigations. Based on previous reports and contaminant concentrations, there is a potential for free phase product to exist on the Site.
Presence of Underground Utilities	Although utilities have been disconnected on Site, piping and bedding have not been removed and therefore there is a potential for utility corridors to be providing a preferential route of contaminant migration.
Regional/Local Geology	The Site topography varies from approximately 315 and 316.5 masl based on topographic information and previous investigations completed at the Site. The Site and surrounding lands generally slope southeast to the Eramosa River Geology from previous investigations indicate subsurface materials consisting of fill (varying from 0.3 to 3.2 m deep), underlain by native silty fine sand. The approximate bedrock depth based on past investigations on the Site was 2.0 mbgs (elevation of 313.5 masl), and ranged from approximately 0.7 m to 3.4 mbgs (elevation of 312.7 to 315.0 masl). The bedrock was described as dolostone, grey, porous and highly fractured with a rock quality index indicating it is highly weathered and fractured (GLL, 1999). The regional geology indicates the Phase One Study Area consists of "silt to sandy silt matrix, becoming silt to silty clay near Lake Erie, strongly calcareous, moderate to low clast content decreasing southward" (OGS, 2000), and bedrock of the Guelph Formation, consisting of sandstone, shale, dolostone, siltstone (OGS, 1991). The bedrock elevation is approximately 305 masl based on *OGS Preliminary Map P.224, Guelph Area, Southern Ontario, Bedrock Topography Series* (Karrow, 1979).
Regional/Local Hydrogeology	Groundwater levels at the Site have been measured during previous investigations between 2.02 and 4.13 mbgs (310.84 to 316.40 masl) with an inferred groundwater flow direction to the south, toward the Eramosa River.
Uncertainties Affecting the Validity of Phase One CSM	On the basis of the uncertainties presented within the Phase One ESA report, it is possible that a PCA/APEC or land use has not been identified within the individual components of the Phase One ESA. Information was gathered from numerous sources (that is, aerial photographs, City Directories, database searches, historical reports, interviews, and site reconnaissance), which decreases the chance that a major PCA or land use was not identified in this Phase One ESA. Many aspects of the CSM have been previously studied and verified through subsurface investigations (for example, groundwater flow direction); these aspects are not directly affected by the noted uncertainties: • Quality of aerial photographs may not allow some features to be clearly identified, and professional judgment was used to relate the historical features identified in the aerial photographs to present day locations • Municipal addresses are known to change • Information provided by interviewed individuals, could be based on hearsay or personal opinion

Attachment A2
Phase Two ESA Summary

ATTACHMENT A2

Phase Two Environmental Site Assessment

This attachment provides an overview of the site investigation for the CH2M HILL Canada Limited (CH2M) draft Phase Two Environmental Site Assessment (ESA) document for the property identified as the former International Malleable Iron Company (IMICO) foundry facility, in Guelph, Ontario, currently in progress. The Phase Two is based on the current investigation, which began in September 2017, and historic investigations conducted by P&R (1991), Gartner Lee (1999; 2004), Earth Tech (1999), DCS (2007; 2014), AECOM (2012; 2013; 2014; 2015; 2016; 2017), and WSP (2016).

This Phase Two Summary provides an overview for the scope of work and results of the current investigations based on available data up to December 2018. Attachment B provides the Phase Two Conceptual Site Model (CSM), as documented in the draft Phase Two ESA. CH2M is in the process of completing an updated Phase Two ESA for the RA property, which will include additional subsurface investigations currently proposed for the Phase Two Property. The Phase Two ESA with updated analytical results and the finalized Phase Two CSM will be presented as part of a forthcoming risk assessment (RA) submission. The sample and analysis plan for the proposed additional work is provided as Attachment C.

The City of Guelph (City) retained CH2M to provide environmental services for the property located at 200 Beverley Street in Guelph, Ontario, hereafter referred to as the “Phase Two Property” or “Site” (refer to Figure 2-1 [Attachment A1]). The Site is approximately 5.2 hectares in size and is located east of the City’s downtown. The Site currently consists of vacant land historically used for industrial purposes. All onsite buildings have been razed, with concrete floor slabs still in place.

The Site has undergone several subsurface environmental investigations between 1999 and 2018. CH2M has conducted field work to support and update these previous investigations at the Site; to meet current Ontario Regulation (O. Reg.) 153/04 (Ontario Ministry of the Environment, Conservation and Parks [MECP], 2011a), regulatory requirements; and to investigate or further investigate areas of potential environmental concern (APECs) identified during the Phase One ESA (CH2M, 2017). The Phase Two ESA is also being completed to support the future filing of a Record of Site Condition (RSC) for the Site to support the planned redevelopment of the Site.

Proposed Future Land Use

It is CH2M’s understanding that the City of Guelph is considering the property for potential redevelopment of the Site from industrial to one or more of residential, parkland, community, or commercial land use purposes.

Overview of Site Investigation

The Site has undergone several subsurface environmental investigations between 1999 and 2018. The current Phase Two ESA activities on the Site were completed between September 2017 and December 2018. Additional minor sampling and delineation activities are pending. The proposed scope of work is included in an sampling analysis plan (SAP) (Attachment C). Phase Two ESA activities on the Phase Two Property consisted of soil borings, test pits, and installation of groundwater monitoring wells. Analytical data from a total of 134 investigative locations advanced previously across the Site as part of historical Phase Two ESA investigations were considered reliable for use in the current Phase Two ESA. An additional 89 investigative locations, 32 boreholes and test pits, and 57 monitoring wells, were advanced as part of the Phase Two ESA investigation in 2017 and 2018. Analytical data from a total of 158 soil sampling locations and 93 groundwater sampling locations were used for the evaluation of contaminants of concern COCs as part of the Phase Two ESA.

The purpose of the Phase Two investigations were to support and update previous studies; to meet current O. Reg. 153/04, as amended (MECP, 2011a), regulatory requirements; to investigate or further investigate areas of potential environmental concern (APECs) identified during the Phase One ESA (CH2M, 2017); and to provide data to support future remedial activities or an RA that will need to be conducted prior to site redevelopment. In addition, the report is intended to support the eventual filing of an RSC and future redevelopment of the Phase Two Property.

During the Phase One ESA, CH2M identified areas where potentially contaminating activities (PCAs) have occurred on the Phase Two Property and on lands within 250 m of the Phase Two Property. PCAs occurring on the Phase Two Property were subsequently carried through the investigation as APECs, as required by O. Reg. 153/04, as amended. When offsite PCAs were identified as having the potential to impact the Phase Two Property, they were also carried through the investigation as APECs.

As summarized in the Phase One ESA (CH2M, 2017), 33 APECs were identified on the Phase Two Property, of which 29 were attributable to onsite PCAs and 4 were attributable to offsite PCAs (located within 250 m of the Phase Two Property). These APECs and PCAs were the focus of the Phase Two ESA activities. Figure 4-1 (Attachment B) shows the APECs identified in the Phase One ESA for the Phase Two Property, as well as the historical and recent Phase Two ESA borehole and monitoring well locations.

The principal objective of the Phase Two ESA is to enable the assessment and updating of current site conditions (considering previous findings and Site work), to identify general and current subsurface impacts that will need to be managed during site redevelopment. The Phase Two ESA included multiple soil and groundwater site investigations, as follows:

- Review of historical reports for previous subsurface investigations. A total of 106 boreholes, test pits, and confirmatory samples, and 38 monitoring wells were advanced or installed as a part of the historical investigations, resulting in 172 historical soil samples considered reliable for use in the Phase Two ESA. Groundwater samples were collected in 2007, and 2011 to 2016 by AECOM as part of an annual groundwater monitoring program, resulting in 186 historical groundwater samples that were considered reliable for use in the Phase Two ESA.
- Drilling 30 boreholes, and advanced 20 test pits for the collection of selected soil samples analyzed for COCs to address data gaps identified while reviewing the current and historical data, and to assess and determine subsurface stratigraphy. Boreholes and test pits were advanced as follows:
  - October 2017: 16 boreholes were advanced (BH17-200 through BH17-203, and MW17-100S, MW17-101D, MW17-102D, MW17-103D, MW17-104D, MW17-105D, MW17-106D, MW17-107S, MW17-108S, MW17-109S, MW17-110S, and MW17-111S) to depths of 0.89 to 3.2 metres below ground surface (mbgs).
  - October 2017: 9 test pits were advanced (TP17-300 through TP17-308) to depths of 1.22 to 2.59 mbgs.
  - June-July 2018: 14 boreholes were advanced (BH18-204 through BH18-208, and MW18-117S, MW18-120D, MW18-121S, MW18-122D, MW18-123D, MW18-124S, MW18-125S, MW18-126D, and MW18-129D) to depths of 2.29 to 3.66 mbgs.
  - July 2018: 11 test pits were advanced (TP18-309 through TP18-319) to depths of 1.21 to 2.89 mbgs.
- Installing 57 groundwater monitoring wells, and sampled from an additional 36 historical monitoring well locations, as follows:
  - September 2017: Sampled 26 existing monitoring wells (OW02, OW03-I, OW03-II, OW07-31, OW07-32, OW07-33, OW07-34D, OW07-34S, OW-07-37, OW07-38S, OW11-I, OW11-II, OW12, OW13-39D, OW13-39S, OW15, OW16, OW17, OW19, OW22D, OW22S, OW23D, OW24D, OW24S, OW25, and OW31).

  - October 2017: 17 monitoring wells were installed to depths ranging from 3.66 to 15.29 mbgs. Thirteen wells were installed in the overburden and bedrock contact zone: MW17-100S, MW17-101S, MW17-103S, MW17-104S, MW17-104D, MW17-105S, MW17-106S, MW17-106D, MW17-107S, MW17-108S, MW17-109S, MW17-110S, and MW17-111S. Screen depths ranged from 1.22-3.66 mbgs to 7.01-8.53 mbgs. Four wells were installed in the Eramosa Formation bedrock unit: MW17-101D, MW17-102D, MW17-103D, and MW17-105D. Screen depths ranged from 6.3-7.82 mbgs to 13.76-15.29 mbgs. Groundwater samples were collected in October and November 2017.
  - March 2018: sampled from 12 existing monitoring wells (MW17-101D, MW17-108S, OW07-31, OW07-33, OW09-II, OW11-II, OW12, OW13, OW14, OW19, OW22S, and OW23S).
  - April 2018: Sampled from five existing monitoring wells (MW17-101D, OW07-33, OW09-II, OW11-II, OW22S).
  - July 2018: Sampled from two existing monitoring wells (MW17-100S, MW17-104D).
  - July 2018: 27 monitoring wells were installed to depths ranging from 4.04 to 20.32 mbgs. Fourteen wells were installed in the overburden and bedrock contact zone : MW18-112S, MW18-113S, MW18-114S, MW18-115S, MW18-116S, MW18-117S, MW18-118S, MW18-119S, MW18-123S, MW18-124S, MW18-125S, MW18-121S, MW18-127S, and MW18-131S. Screen depths ranged from 2.51-4.03 mbgs to 4.26-5.79 mbgs. Thirteen wells were installed in the Eramosa Formation bedrock unit: MW18-107D, MW18-112D, MW19-116D, MW18-120D, MW18-121D, MW18-122D, MW18-123D, MW18-126D, MW18-128D, MW18-129D, MW18-130D, MW18-132D, and MW18-133D. Screen depths ranged from 6.4-9.49 mbgs to 12.44-20.32 mbgs. Groundwater samples were collected in July and August 2018.
  - October 2018: Sampled from seven existing monitoring wells (MW18-128D, MW18-130D, MW18-131S, MW18-132D, MW18-133D, OW25, and OW31).
  - November-December 2018: 13 monitoring wells were installed to depths ranging from 4.27 to 25.32 mbgs. Two wells were installed in the overburden and bedrock contact zone (MW18-134S and MW18-135S). Screen depths ranged from 2.74-4.27 mbgs to 9.75-11.28 mbgs. Eleven wells were screened in the Eramosa Formation (MW18-105G, MW18-112G, MW18-113D, MW18-114D, MW18-115D, MW18-119D, MW18-122G, MW18-134D, MW18-135D, MW18-136D, and MW18-136G). Screen depths ranged from 4.27-5.79 to 23.8-25.32. Groundwater samples were collected from all newly-installed wells and two existing wells were resampled (MW17-102D and MW18-112D).

- Collecting groundwater levels using an oil/water interface probe from the recently installed wells to determine groundwater elevations and to determine whether free-phase product was present.
- Conducted single-well hydraulic tests on 14 monitoring wells to improve the understanding of hydraulic properties of the subsurface materials across the Phase Two Property.
- Determining the applicable SCS.
- Surveying newly installed boreholes and new and existing monitoring wells, to a geodetic benchmark.

Figure 6-1 (Attachment B) shows the locations of the borings and wells, advanced as part of this Phase Two ESA, as well as during historical investigations. Environmental studies were conducted at the Site in the past, and the historical results were used as a screening method to focus the current Phase Two ESA work. Where reliable, as evaluated through a data quality evaluation (DQE), the historical results were used to supplement the Phase Two ESA results. In general, the historical data used are considered valid for inclusion in this Phase Two ESA.

Quality Assurance and Quality Control

Soil and groundwater sampling was preformed by CH2M staff with experience in intrusive field investigation techniques and with the COCs encountered at the Phase Two Property, under the guidance of the Qualified Person for ESAs according to MECP (O. Reg. 153/04) (QPESA). CH2M collected soil and groundwater samples in accordance with the standard operating procedures (SOPs) and field forms, which were developed in accordance with O. Reg. 153/04, as amended (MECP, 2011a).

The following sample packaging storage and transportation procedures were followed during the investigation:

1. Reviewed the project sampling plan to verify that samples for the required chemical parameters were collected and submitted for analysis.
2. Verified that the samples listed in the chain of custody (CoC) form were included in the sample shipment, and that the correct analysis was requested.
3. Included one laboratory-prepared trip blank in each cooler containing volatile organics (VOCs, BTEX, and PHC F1) samples.
4. Dispersed ice throughout the cooler to surround the sample bottles and to maintain a proper temperature of less than 10 degrees Celsius (°C) throughout the trip to the laboratory. Sample containers were packed upright, never lying on their sides, and at least one third of the cooler space was taken up by ice.
5. Placed a copy of the original CoC form in a resealable plastic bag in the cooler.
6. Kept a copy of the CoC form for the project records.
7. Samples marked “HOLD” were analyzed within the required holding time and holding temperature, if analyzed.

Quality assurance (QA)/quality control (QC) samples were collected as required by O. Reg. 153/04, as amended (MECP, 2011a).

Duplicate soil and groundwater samples were collected at a frequency of one duplicate for each 10 samples submitted. Duplicate soil samples were collected by vertically splitting core samples into two equal volumes prior to placing them in the appropriate sample containers. Duplicate groundwater samples were submitted ‘blind’ to the laboratory, and field staff documented in the field books each duplicate sample location.

Trip blanks were collected for coolers containing samples being submitted for volatile analysis at a frequency of one per day, regardless of the number of samples. Dedicated sampling equipment was used for groundwater sampling.

Samples were analyzed by ALS Laboratory Group (ALS), a laboratory accredited by the Canadian Association for Laboratory Accreditation Inc. ALS, and subcontractor laboratories overseen by ALS, performed the chemical analysis in compliance with the MECP, Laboratory Services Branch, *Protocol for Analytical Methods Used in the Assessment of Properties under Past XV.1 of the Environmental Protection Act,* as amended (MECP, 2011b).

CH2M received soil and groundwater certificates of analysis from ALS electronically to reduce the possibility of transcription errors. The analyses were compiled into a database. The automation of data transfers from laboratory instruments to laboratory information management systems (LIMSs) also reduced the possibility of transcription errors. The results reported by ALS were quality-checked

internally by a project chemist before being uploaded to the database. Analytical results were reviewed and validated by the project chemist.

The data review and validation performed by the project chemist are documented in the DQE reports provided in the Phase Two ESA. The DQE assessed the quality of the analytical results for the samples submitted in batches with the Phase Two Property investigation samples.

The goals of the DQE were to demonstrate that a sufficient number of representative samples were collected, and that the resulting analytical data can be used to support the decision-making process. Based on the data validation findings, all CH2M data are valid and can be used for making project decisions with the limitations described in the DQE.

In consultation with the project chemist, the QP_{ESA} concluded that the data met the data quality objectives, the decision-making was not affected, and the overall objectives of the investigation and assessment were met.

Applicable Site Condition Standards

O. Reg. 153/04 (MECP, 2011a) under Part XV.1 of the *Environmental Protection Act* addresses the assessment, cleanup, and filing of an RSC for brownfield sites in Ontario and is applicable to the Phase Two Property. CH2M evaluated the Site based on a number of criteria to decide which of the generic SCS provided in the *Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act* (MECP, 2011c)*,* were applicable for a comparison of soil and groundwater results from the Phase Two ESA investigation.

The items in Table 2-3 were considered during the selection of the SCS, as outlined in O. Reg. 153/04, as amended (MECP, 2011a).

The special conditions for environmentally sensitive areas under Section 41 of O. Reg. 153/04 are potentially applicable to the Phase Two Property, as soil pH was found to range from 6.6 to 10.64 based on 91 soil samples. As discussed in Table 2-3, with the exception of two samples, the remainder of the soil samples were found to have a pH value within the Ministry's acceptable range (that is, a pH value in surface soil between 5 and 9, or a pH value in subsurface soil between 5 and 11). The soil from one borehole was determined to be "isolated fill" as concrete foundations were encountered both above and below the soil layer, isolating it from the overburden soils at the Site. For this reason, the soil pH from this sample was not considered representative of Site soils and was removed from consideration in determining soil pH at the Site. Therefore, the maximum pH concentration in soil is 9.45. A proposed sampling program is included in Attachment C to address the remaining pH value through the approved averaging techniques outlined in O. Reg 153/04 and to determine if the Table 1 SCS are potentially applicable or not. Based on the overall available pH data for the Site as noted above, it is currently assumed that, as a whole, pH will be confirmed within the acceptable range; therefore, Table 1 will not be applicable. The CSM and associated Phase Two report will be revised accordingly once the additional pH data is available, but currently assumes the Table 6 SCS is applicable.

The special conditions for land within 30 metres of a water body under Section 43.1 of O. Reg. 153/04 do not apply to the Phase Two Property; however, as bedrock has been encountered in the past at less than 2 metres below ground surface (DCS, 2014), the special condition for shallow soil properties cited under Section 43.1 of O. Reg. 153/04 applies to the Phase Two Property.

The Phase Two Property, and adjacent properties within 100 m are serviced by a municipal water source. As the groundwater in the vicinity of the Property does and will serve as a raw water supply for a drinking water system, the potable groundwater condition was applied. Based on this information, the *Table 6: Generic Site Condition Standards for Shallow Soils in a Potable Groundwater Condition* for coarse-grained soil and residential/parkland/institutional property use (Table 6 SCS) was applied to the Site.

Additional Data Screening

As part of the Phase Two ESA, a thorough review of the soil and groundwater results was conducted as part of the screening and identification of COCs. Select soil and groundwater results, such as elevated laboratory reported detection limits or historical groundwater results where more recent data were available, were determined to not be representative of Site conditions. At the discretion of the QPESA for the Site, these data points have been excluded from the analytical database. The rationale for the removal of each of the data points is presented in Table 6-7b (soil) and Table 6-10b (groundwater).

Phase Two Environmental Site Assessment Results and Conclusions

Soil environmental conditions were characterized based on evaluation of historical samples, in addition to the recent investigations conducted for the Phase Two ESA.

Soil conditions were characterized using the Phase Two ESA sampling and reliable historical data, comprising 307 soil samples from 157 locations across the Phase Two Property. Refer to Figure 4-1 (Attachment B) for sample locations. The Phase Two Property was found to be generally impacted with the following parameters:

- Metals
- Petroleum hydrocarbons (PHCs)
- Volatile organic compounds (VOCs)

These types of impacts are consistent with the historical and industrial land use of the Phase Two Property, which included:

- Former Foundry (APEC-1)
- Machine Shop (APEC-2, APEC-12)
- Annealing Room (APEC-3)
- Sand Storage (APEC-4, APEC-15)
- Plating and Galvanizing (APEC-5, APEC-11)
- Chipping and Grinding (APEC-6)
- Former USTs (APEC-8)
- Former Rail Line (APEC-13)
- Former Auto Repair and Garage (APEC-14, APEC-20)
- Coal Storage (APEC-21)
- Paint Shop (APEC-23)
- Drum Storage (APEC-25)
- Former Electrical Shop (APEC-27)
- Waste Oil Storage (APEC-28)
- Unknown Fill Quality (APEC-29)

Localized soil impacts from polycyclic aromatic hydrocarbons (PAHs), benzene, toluene, ethylbenzene, and xylenes (BTEX), and polychlorinated biphenyls (PCBs)were also identified in limited areas at the Phase Two Property. The presence of these parameters is consistent with the historical and industrial land use of the Site, including the use and storage of PCBs (APECs 16, 17, 22, 24, and 26).

Soil Exceedances of the Table 6 Site Condition Standards

The following soil quality summary is provided for the soil samples that exceeded the Table 6 SCS:

- Concentrations of metals in soil greater than the Table 6 SCS soil were identified in 143 samples (of 222) from 95 locations to a depth of 2.9 mbgs. Soil exceedances for metals were widespread across the Phase Two Property.
- Concentrations of PAHs in soil greater than the Table 6 SCS in 28 samples (of 112) from 20 locations, and were found along the western border, in the south-central area, and the eastern third of the Site. PAH exceedances were identified to a depth of 2.13 mbgs.
- Concentration of PHCs in soil greater than the Table 6 SCS in a total of 28 samples (of 122) from 22 locations. Exceedances were found to be localized to three areas along the western border, in the south-central area, and the eastern third of the Site. PHC exceedances were identified to a depth of 3.2 mbgs.
- Concentrations of BTEX in soil greater than the Table 6 SCS in a total of 3 soil samples (of 120) from 2 locations in the central and western areas of the Site. BTEX exceedances were identified to a depth of 1.22 mbgs.
- Concentrations of PCBs in soil greater than the Table 6 SCS in 6 samples (of 72) from 5 locations in three different areas to a depth of 1.3 mbgs.
- Concentrations of VOCs (specifically trichlorethylene) in soil greater than the Table 6 SCS in a total of 7 samples (of 100) from 5 locations within two areas along the southern and eastern borders of the Site. VOC exceedances were identified to a depth of 2.44 mbgs.
- Inorganics (that is, sodium adsorption ratio, electrical conductivity, and cyanide) were not detected at concentrations greater than the Table 6 SCS.
- Acid, base, and neutrals (ABNs), chlorophenols (CPs), and organochlorine pesticides (OCPs) were not detected at concentrations greater than the Table 6 SCS; however, reporting limits (RLs) were raised for some parameters resulting in RL exceedances of the Table 6 SCS.

Refer to the CSM for additional details (Attachment B) regarding soil quality and delineation.

Groundwater Exceedances of the Table 6 Site Condition Standards

Groundwater across the Phase Two Property was evaluated using data from 93 permanent monitoring wells screened in the overburden and bedrock contact zone, the competent Eramosa Formation bedrock unit, or the Goat Island Formation bedrock unit. Groundwater within the overburden and contact zone aquifer unit was identified to be generally impacted with VOCs, with localized impacts of metals (arsenic, lead, and zinc), BTEX, PAHs, and PHCs. Groundwater within the competent Eramosa Formation bedrock unit was identified to be generally impacted with VOCs, with localized impacts of metals (arsenic, lead, and zinc), benzene, and PHCs (F2 and F3). One well is installed in the deep Goat Island Formation aquifer unit and was found to be impacted with cis-1,2-dichloroethene.

The following groundwater quality summary is provided for the groundwater samples exceeding the Table 6 SCS:

- Concentrations of VOCs in groundwater were greater than the Table 6 SCS in 155 samples (of 259) in 52 locations. Exceedances of chloroethenes (specifically, 1,1-dichloroethene; cis-1,2-dichloroethene; tetrachloroethene; trans-1,2-dichloroethene; trichloroethylene; and vinyl chloride) were found to be

spread throughout the Site (mainly to the south and east) at all depth intervals. A total of 152 samples (of 258) from 50 locations had exceedances of the Table 6 SCS for chloroethenes. Exceedances of chloroethanes (specifically, 1,1,1-trichloroethane and 1,1-dichloroethane) were found to be localized to the southwestern area of the Phase Two Property primarily in the overburden and bedrock contact zone. One well screened within the competent Eramosa Formation aquifer (MW18-122D) had an exceedance of 1,1-dichloroethane.

- Concentrations of metals (primarily arsenic, lead, and zinc) in groundwater were greater than the Table 6 SCS in 71 samples (of 248) from 22 locations. Arsenic exceedances were localized to the north-central area of the Site. Lead exceedances were localized to OW09-II and OW07-33, however OW07-33 has had subsequent sampling results less than the Table 6 SCS. Many of the zinc exceedances were located on the eastern third of the Phase Two Property.
- Concentrations of BTEX in groundwater were greater than the Table 6 SCS in 56 samples (of 271) from 17 locations. Of these samples, concentrations of benzene were elevated in 55 samples from 16 locations, and exceedances of ethylbenzene were identified in 3 samples from 3 locations. Exceedances were localized to the eastern third of the Site and the south-central area along the southern boundary.
- Concentrations of PAHs in groundwater were greater than the Table 6 SCS in 24 samples (of 189) from 8 locations. Exceedances were localized to the eastern third, the north-central, and south-central portions of the Phase Two Property. All exceedances were found in wells screened in the overburden and contact zone aquifer; no PAHs impacts were reported in wells screened in the Eramosa Formation bedrock unit or the Goat Island bedrock unit.
- Concentrations of PHCs in groundwater were greater than the Table 6 SCS in 26 samples (of 207) from 8 locations. Light nonaqueous phase liquid (LNAPL) was observed at OW23S, MW17-108S, and MW18-135S. Exceedances were localized to the eastern third and the south-central area of the Phase Two Property which are limited to the overburden and contact zone aquifer. Two locations screened in the Eramosa Formation bedrock unit (OW18-II and MW23D) have generally have PHC concentrations less than the Table 6 SCS, with isolated exceedances occurring in 2015 and 2016. PHC concentrations have meet the Table 6 SCS in the most recent sampling events at these locations.
- Of the 25 samples analyzed in groundwater for PCBs, one location, OW26S, had an exceedance of the Table 6 SCS in 2010. Subsequent samples collected in 2011 and 2017 met the Table 6 SCS for PCBs; therefore, PCBs are not considered a groundwater COC for the Site.
- Inorganics (that is, sodium, chloride, and cyanide) were not detected at concentrations greater than the Table 6 SCS.
- ABNs were not detected at concentrations greater than the Table 6 SCS in 52 samples; however, reporting limits (RLs) were raised for 1,1'-biphenyl at OW23S resulting an RL exceedance of the Table 6 SCS.
- CPs and OCPs were not detected at concentrations above the method detection limits, and, therefore, did not exceed the Table 6 SCS.

Refer to the CSM for additional details (Attachment B) regarding groundwater quality and delineation.

A2 Tables

Table 2-3. Items Considered for Site Condition Standards Selection

Phase Two Environmental Site Assessment, 200 Beverley Street, Guelph, ON

Condition	Evaluation
Land use	The current land use is industrial, and the proposed future land use may include residential/parkland and commercial, provided an RSC acknowledged by the MECP is obtained.
Potable or non-potable groundwater	The Site and adjacent properties within 100 m are serviced by a municipal water source. As the groundwater in the vicinity of the Property does and will serve as a raw water supply for a drinking water system, the potable groundwater condition will be applied.
Proximity to surface water body	The Phase Two Property is not located within 30 m of a water body.
Proximity to areas of natural significance or environmentally sensitive areas	The Site is not considered to be within the proximity of an environmentally sensitive area based on the information reviewed as part of the Phase One ESA (CH2M, 2017).
Depth to bedrock	A property is considered a shallow soil property if one-third or more of the area consists of soil depths of 2 mbgs or less, excluding non-soil surface treatment (that is, asphalt, concrete, or aggregate) (MECP, 2011).The depth to bedrock is considered to be less than 2 m, and shallow soil was observed on one-third or more of the Phase Two Property.
pH of soil	Based on the results of the CH2M and historical investigations comprised of 91 analyses for pH, soil pH was found to range from 6.6 to 10.64. Two soil samples collected at BH17-204 and MW17-100S were measured with a pH value outside of the MECP's acceptable upper limit of 9 for surface soils. A review of the borehole logs from these locations indicated that concrete rubble or dust was likely present in the submitted samples which had pH values of 9.45 and 10.64. The soil from BH17-204 was determined to be "isolated fill" as concrete foundations were encountered both above and below the soil layer, isolating it from the overburden soils at the Site. For this reason, the soil pH from this sample was not considered representative of Site soils and was removed from consideration in determining soil pH at the Site. Therefore, the maximum pH concentration in soil is 9.45 from MW17-100s. All other pH values collected during the CH2M and historical investigations were within the MECP's acceptable range. A proposed sampling program is included in Attachment C, to address the remaining elevated pH value through the approved averaging techniques outlined in O. Reg. 153/04.
Soil texture	For this evaluation, due to the extensive presence of heterogeneous fill materials across the Site, the standards for coarse-grained soils were used to be conservative.

Table 6-7b. Rationale for the Removal of Soil COCs

Phase Two Environmental Site Assessment, 200 Beverley Street, Guelph, Ontario

Parameter Group	Parameter(s)	Category	Detail/Sample(s)	Rationale
ABN	1,1'-Biphenyl 1,2,4-Trichlorobenzene 2,4 & 2,6-Dinitrotoluene 3,3'-Dichlorobenzidine 4-Chloroaniline Bis (2-chloroethyl) ether Diethylphthalate Dimethylphthalate	Parameters with existing SCS but RL exceedances only	Two surface samples (original and field duplicate) collected at TP17-300 in 2017 (Lab report L2003037)	The laboratory report indicates adjusted detection limits due to sample matrix effects (i.e., chemical interference, colour, and turbidity), preventing the determination of the presence or absence of the parameters (greater or less than regular detection limits), which may be due to the nature of the fill materials. Concentrations of these ABNs have not been detected elsewhere on the Site, including the 11 other locations where ABNs were analyzed as a COPC and RLs met the SCS. Additionally, a sample collected from a deeper interval at TP17-300 did not have raised RLs and met the SCS. Based on the available information, these parameters were determined to likely not be present at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, were not considered to be COCs for the Site.
ABN	2,4 & 2,6-Dinitrotoluene 3,3'-Dichlorobenzidine Dimethylphthalate	Parameters with existing SCS but RL exceedances only	Six surface samples from 1991 (lab report 91-4281/P&R_E.O.90K2)	Parameters were run as part of older BNA laboratory scans alongside VOCs and PAHs, and were not targeted COCs. Historical laboratory RLs may not have had capabilities to meet current SCS. Concentrations of these ABNs have not been detected elsewhere on the Site, including the 11 locations where ABNs were analyzed as a COPC and RLs met the SCS. Based on the available information, these parameters were determined to likely not be present at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, were not considered to be COCs for the Site.
ABN	2,4-Dinitrophenol	Parameters with existing SCS but RL exceedances only	Seven surface samples from three locations (MW17-105D, TP17-300 and TP17-301) in 2017, including 2 duplicates (lab report L2003037).	Lab indicated matrix effects as the reason for an RL increase, which may be due to the nature of the fill materials. No detected concentrations of 2,4-dinitrophenol have been reported at the Site, including the 9 other locations where ABNs were analyzed as a COPC and RLs met the SCS. Additionally, a sample collected from a deeper interval at MW17-105D did not have raised RLs and met the SCS. Based on the available information, this parameter was determined to likely not be present at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, was not considered to be a COC for the Site.
CP	2,4-Dichlorophenol Pentachlorophenol	Parameters with existing SCS but RL exceedances only	Seven surface samples from three locations (MW17-105D, TP17-300 and TP17-301) in 2017, including 2 duplicates (lab report L2003037).	Lab indicated matrix effects as the reason for an RL increase, which may be due to the nature of the fill materials. No detected concentrations of 2,4-dichlorophenol and pentachlorophenol have been reported at the Site, including the 9 other locations where ABNs were analyzed as a COPC and RLs met the SCS. Additionally, a sample collected from a deeper interval at MW17-105D did not have raised RLs and met the SCS. Based on the available information, these parameters were determined to likely not be present at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, were not considered to be COCs for the Site.
CHEMISTRY	Phosphorus	Parameters with no Table 6 SCS but exceeds the OTR value	Two samples from TP13-11 (TP11-6 and DUP2) in 2013 (Lab report B3K9090)	Two of 43 samples analyzed for phosphorus were above the OTR value of 1635 µg/g. The remaining 41 samples had concentrations of phosphorus below the OTR value. Samples were from 1991, 2007 and 2013 as phosphorus was analyzed as part of the historical laboratory metal suites; it was not targeted as a COC. As phosphorus is considered a nutrient and is not a COPC associated with any APEC on Site, and at the discretion of the QPESA, phosphorus is not considered to be a COC for the Site.
METALS	Chromium, Hexavalent (Cr6+)	Parameters with existing SCS but RL exceedances only	24 RL exceedances from 1991 (Lab reports P&R_E.O.90K26, 91-4543/P&R_E.O.90K2, 91-4281/P&R_E.O.90K2, 91-4543/91-4281)	All 24 samples collected in 1991 for hexavalent chromium had RL exceedances. Historical laboratory RLs may not have had capabilities to meet current SCS. Recent sampling conducted in 2007, 2017, and 2018 do not show concentrations detected on the Site above the SCS (65 results with non detect concentrations below the SCS and 6 samples with detected concentrations below the SCS). Based on the available information, this parameter was determined to likely not be present at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, was not considered to be a COC for the Site.
METALS	Cyanide	Parameters with existing SCS but RL exceedances only	All historical samples (five from 1991 and 20 from 2007) (Lab reports 91-281/P&R_E.O.90K2, P&R_E.O.90K26, 91-4281, 07T209831, 07T211735)	All samples analyzed for cyanide in 1991 and 2007 had RL exceedances. Historical laboratory RLs may not have had capabilities to meet current SCS. Recent sampling conducted in 2017 and 2018 have 51 results with nondetect concentrations below the SCS. No concentrations of cyanide have been detected at the Site. Based on the available information, this parameter was determined to likely not be present at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, was not considered to be a COC for the Site.
METALS	Bismuth	Parameters with no Table 6 SCS and no OTR value	12 samples from 2013 (Lab report B3K9090)	Samples collected as part of historical testpitting activities in 2013 included a full metals scan including bismuth. All other metals without an SCS had an OTR value to compare concentrations except for bismuth. Concentrations ranged from non detect values to 150 µg/g. Bismuth was not a targeted COC. Based on the available information, and at the discretion of the QPESA, bismuth is not considered to be a COC for the Site.
METALS	Calcium	Parameters with no Table 6 SCS but detected concentrations above the OTR value	20 samples from 18 locations collected between 2007 and 2013.	20 of a total of 43 samples from between 2007 and 2013 had results with detected concentrations greater than the OTR value of 53,508 µg/g. Calcium was analyzed as part of the historical laboratory metal suites and was not targeted as a COC. As the bedrock in the region is limestone and dolostone which typically abundant with calcium and magnesium, it is likely that soils in the region would also contain naturally elevated calcium concentrations. As calcium is considered a naturally occurring element and not a COPC associated with any APECs on Site, and at the discretion of the QPESA, calcium is not considered to be a COC for the Site.

Table 6-7b. Rationale for the Removal of Soil COCs

Phase Two Environmental Site Assessment, 200 Beverley Street, Guelph, Ontario

Parameter Group	Parameter(s)	Category	Detail/Sample(s)	Rationale
METALS	Iron	Parameters with no Table 6 SCS but detected concentrations above the OTR value	7 samples from 1991, 1 sample from 2007, and 1 sample from 2013	9 of a total of 43 samples had detected concentrations exceeding the OTR value of 37808 µg/g. The remaining 36 samples all had detected concentrations below the OTR value. Iron was analyzed as part of the historical laboratory metal suites and was not targeted as a COC. As iron is considered a naturally occurring element and is not a COPC associated with any APECs on Site, and at the discretion of the QPESA, iron is not considered to be a COC for the Site.
METALS	Magnesium	Parameters with no Table 6 SCS but detected concentrations above the OTR value	9 samples from 1991, 4 samples from 2007, and 6 samples from 2013	19 of a total of 43 samples had results with detected concentrations greater than the OTR value of 17,400 µg/g. The remaining 24 samples had detected concentrations below the OTR value. Magnesium was analyzed as part of the historical laboratory metal suites and was not targeted as a COC. As the bedrock in the region is limestone and dolostone which typically abundant with calcium and magnesium, it is likely that soils in the region would also contain naturally elevated magnesium concentrations. As magnesium is considered a naturally occurring element and not a COPC associated with any APECs on Site, and at the discretion of the QPESA, magnesium is not considered to be a COC for the Site.
METALS	Sodium	Parameters with no Table 6 SCS but detected concentrations above the OTR value	6 samples from 1991, and 4 samples from 2013	10 of a total of 43 samples had detected concentrations greater than the OTR value of 215 µg/g. 29 of the remaining 33 samples had detected concentrations of sodium below the OTR value, and 4 samples had non detected concentrations of sodium. Sodium was analyzed as part of the historical laboratory metal suites, and current methods analyze Sodium risks using SAR analysis. All SAR results are below the SCS. Based on the available information, including SAR results below the SCS, at the discretion of the QPESA, sodium is not considered to be a COC for the Site.
METALS	Strontium	Parameters with no Table 6 SCS but detected concentrations above the OTR value	7 samples, 2 from 1991 and 5 from 2013	7 of a total of 43 samples had detected concentrations greater than the OTR value of 87.5 µg/g, with a maximum of 190 µg/g. The remaining 36 samples had detected concentrations of strontium below the OTR value. Strontium was analyzed as part of the historical laboratory metal suites and was not targeted as a COC. As strontium is considered a naturally occurring element and is not a COPC associated with any APEC on Site, and at the discretion of the QPESA, strontium is not considered to be a COC for the Site.
OCP	Hexachlorobutadiene Hexachloroethane	Parameters with existing SCS but RL exceedances only	6 historical samples from 1991 with RL exceedances in soil.	All samples analyzed for hexachlorobutadiene and hexachloroethane in 1991 had RL above the SCS. Historical laboratory RLs may not have had capabilities to meet current SCS. These individual OCP parameters (including hexachlorobenzene and hexachloropentadiene) were run as part of older BNA laboratory scans alongside VOCs and PAHs, and were not targeted COCs. OCPs are not considered to be a COPC on Site, and therefore were not analyzed in the 2017/2018 environmental investigations. Based on the available information, at the discretion of the QPESA, these parameters are not considered to be COCs for the Site.
VOC	1,1,2,2-Tetrachloroethane	Parameters with existing SCS but RL exceedances only	One sample from MW17-108S in 2017 (2.74 to 2.9 mbgs) (Lab report L2007635)	One sample of 100 analyzed contained an RL exceedance. Laboratory report indicated adjusted detection limits due to co-eluting interferences (i.e., interfering peaks on the VOC method) preventing the determination of the presence or absence of the VOC analytes (greater or less than regular detection limits). The remaining 99 samples, including one sample collected at a deeper interval at the same location, had non detected concentrations of this parameter which met the SCS. Based on the available information, this parameter was determined to likely not be present at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, were not considered to be a COC for the Site.
VOC	Bromomethane Vinyl Chloride	Parameters with existing SCS but RL exceedances only	One sample from BH07-67 in 2007 (Lab report 07T209831)	One sample of 100 contained RL exceedances for the noted VOCs. Laboratory report indicated adjusted detection limits due to co-eluting interferences (i.e., interfering peaks on the VOC method) preventing the determination of the presence or absence of the VOC analytes (greater or less than regular detection limits). The remaining 99 samples, including one sample collected at a deeper interval at the same location, had non detected concentrations of these parameters. Additionally, for vinyl chloride, the occurrence of the raised RL is at a location 150m away from the closest detections of a potential parent compound (trichloroethylene) which was detected in two locations on Site in soil (at a max of 1 µg/g). All other locations and chlorinated parameters have not been detected in soil on Site. Based on the available information, these parameters were determined to likely not be present at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, were not considered to be a COC for the Site.
VOC	Dichloromethane	Parameters with existing SCS but RL exceedances only	MW17-107S-0.5-2 RL exceedance in soil (Lab report L2007635)	One sample of 100 contained RL exceedances for the noted VOCs. Laboratory report indicated adjusted detection limits due to co-eluting interferences (i.e., interfering peaks on the VOC method) preventing the determination of the presence or absence of the VOC analytes (greater or less than regular detection limits). The remaining 99 samples had non detected concentrations of this parameter. Based on the available information, this parameter was determined to likely not be present at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, were not considered to be a COC for the Site.

Table 6-7b. Rationale for the Removal of Soil COCs

Phase Two Environmental Site Assessment, 200 Beverley Street, Guelph, Ontario

Parameter Group	Parameter(s)	Category	Detail/Sample(s)	Rationale

Notes:

The rationale for exclusion of COCs listed in this table is based on the data collected as part of the ESA and only applies to this ESA.

µg/g = microgram per gram
ABN = acid, base, and neutral compound
APEC = area of potential environmental concern
COC = contaminant of concern
COPC = contaminant of potenical concern
CP = chlorophenol
ESA = Environmental Site Assessment
mbgs = metre(s) below ground surface
RL = laboratory reporting limit
MECP = Ontario Ministry of the Environment, Conservation and Parks
No. = number
OCP = organochlorine pesticide
PAH = polycyclic aromatic hydrocarbon
PCA = potentially contaminating activity
PCB = polychlorinated biphenyl
PHC = petroleum hydrocarbon
QPESA = MECP Qualified Person for Environmental Site Assessment
RSC = Record of Site Condition
SCS = Site Condition Standards
VOC = volatile organic compound

Table 6-10b. Rationale for the Removal of Groundwater COCs

200 Beverley Street, Guelph, Ontario

Parameter Group	Parameter	Category	Sample(s)	Comment/Rationale
ABN	1,1'-Biphenyl	Parameters with existing SCS but RL exceedances only	OW23S RL exceedance in 2014 (Lab report B4J8984 from Maxxam)	1,1-Biphenyl was run as part of a historical PAH laboratory scan, and was not a targeted as a COC for the area. No detected concentrations of 1,1'-biphenyl have been reported at the Site. The raised RL is likely due to LNAPL interference, as there has been consistent measurement of free product in this well. The remaining 44 locations where 1,1-biphenyl was analyzed did not report detected concentrations and RLs met the SCS. Based on the available information, this parameter was determined to likely not be present at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, was not considered to be a COC for the Phase Two Property.
BTEX	Benzene Ethylbenzene	Parameters with existing SCS, one exceedance and subsequent samples meeting SCS	OW22S exceedance in 2016, subsequent two events in 2017 and 2018 meet SCS	Benzene was measured at 1.1 µg/L and toluene at 7.1 µg/L in 2016 at OW22S. Historical analyses from seven sampling events and two sampling events in 2017 and 2018 at this location met the SCS of 0.5 and 2.4 µg/L, respectively. Based on the available information, these parameters were determined to likely not be present at OW22S at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, were not carried through for the dataset for the Risk Assessment. The parameters were retained as a COCs for the Phase Two Property based on other locations exceeding the SCS.
BTEX	Benzene Ethylbenzene	Parameters with existing SCS and both RL and detected exceedances	OW24D RL exceedances in 2010, 2011, 2012, 2014, and 2015.	The VOC parameters noted had RLs exceeding the SCS at OW24D from samples collected between 2010 and 2015. Laboratory reports indicated that detection limits were adjusted as the sample required dilution due to high concentrations of other target analytes (review indicated PHC F1 and chlorinated VOCs were up to 5,400 µg/L). Samples collected in 2017 and 2018 from OW24D had non-detect concentrations reported with RLs meeting the SCS. Based on the available information, these parameters were determined to likely not be present at OW24D at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, were not carried through for the dataset for the Risk Assessment. The parameters were retained as a COCs for the Phase Two Property based on other locations exceeding the SCS.
BTEX	Toluene Xylenes	Parameters with existing SCS but RL exceedances only	OW24D RL exceedances in 2010, 2011, 2012, 2014, and 2015.	Groundwater samples from OW24D had raised RLs for six events between 2010 and 2015. Toluene RLs exceeded the SCS. All raised xylene RLs met the SCS. Laboratory reports indicated that detection limits were adjusted as the sample required dilution due to high concentrations of other target analytes (review indicated PHC F1 and chlorinated VOCs were up to 5,400 µg/L). Samples from this location taken in 2016 and 2017 did not have raised RLs which met the SCS. Toluene and xylenes met the SCS at all other locations on the Phase Two Property. Based on the available information these parameters were determined to likely not be present at OW24D at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, these parameters were not considered to be COCs for the Phase Two Property.
CHEMISTRY	Alkalinity, Bicarbonate (as CaCO3), Alkalinity, Total (as CaCO3), Calcium, Fluoride, Iron, Manganese, Potassium	Parameters with no Table 6 SCS but exceeds the PGMIS value	All samples analyzed (range from 2012 to 2016)	Chemistry parameters (pH, conductivity, alkalinity, specific conductance) and major ions (fluoride, chloride, nitrate, nitrite, bromide, phosphate, sulfate, calcium, potassium, manganese, sodium) were introduced into the annual groundwater monitoring program in 2010 and analyzed for until 2016. Iron was included in analytical suites in 2012 to 2014 and 2016. Alkalinity (both bicarbonate and total) exceeded the PGMIS value of 55,000 µg/L in all 134 samples and ranged from 250,000 to 550,000 µg/L. Calcium exceeded the PGMIS value of 431,000 µg/L in one of 134 samples with a concentration of 440,000 µg/L. Fluoride exceeded the PGMIS value of 2090 µg/L in 11 of 77 samples with concentrations up to 3,900 µg/L. Iron exceeded the PGMIS value of 4090 µg/L in 7 of 58 samples with concentrations up to 8900 µg/L. Manganese exceeded the PGMIS value of 717 µg/L in 4 of 58 samples with concentrations up to 1200 µg/L. Potassium exceeded the PGMIS value of 20,700 µg/L in one of 134 samples with a concentration of 30,600 µg/L. Rationale was not provided for the analyses of these parameters, as they were not required under the MOE Provincial Order that the annual groundwater monitoring was conducted under. Parameters analyzed were those typically collected for monitoring geochemical conditions in groundwater for potential remediation options or the occurrence of degradation or attenuation of contaminants. As these parameters were not identified as COPCs on the Site or associated with an APEC on the Site, at the discretion of the QPESA, they were not considered to be COCs.

Table 6-10b. Rationale for the Removal of Groundwater COCs

200 Beverley Street, Guelph, Ontario

Parameter Group	Parameter	Category	Sample(s)	Comment/Rationale
CHEMISTRY	Ammonia, Electrical Conductivity, Specific conductance, Bromide	Parameters with no Table 6 SCS or PGMIS value, but have detected concentrations	All samples analyzed (range from 2012 to 2016)	Chemistry parameters (pH, conductivity, alkalinity, specific conductance) and major ions (fluoride, chloride, nitrate, nitrite, bromide, phosphate, sulfate, calcium, potassium, manganese, sodium) were introduced into the annual groundwater monitoring program in 2010 and analyzed for until 2016. Ammonia was included in the analytical suites from 2012 to 2014. Ammonia had detected concentrations in 41 of 57 samples collected with concentrations up to 1,750 µg/L. Bromide had detected concentrations in one of 77 samples collected with a concentration of 1,000 µg/L (at the detection limit). Electrical conductivity ranged from 0.5 to 2.0 mS/cm. Specific conductance ranged from 500 to 1,800 umhos/cm. Rationale was not provided for the analyses of these parameters, as they were not required under the MOE Provincial Order that the annual groundwater monitoring was conducted under. Parameters analyzed were those typically collected for monitoring geochemical conditions in groundwater for potential remediation options or the occurrence of degradation or attenuation of contaminants. As these parameters were not identified as COPCs on the Site or associated with an APEC on the Site, at the discretion of the QPESA, they were not considered to be COCs.
CHEMISTRY/METALS	Silica (as SIO2), Sulfur, Cesium (Cs), Lithium, Rubidium (Rd), Silicon, Tin	Parameters with no Table 6 SCS or PGMIS value, but have detected concentrations	One sample from OW31 from September 2016 (Lab report L1830739)	A full metals suite was run for the groundwater sampling completed in 2016 at OW31. A number of parameters did not have SCS values or PGMIS values to compare concentrations. Detected concentrations can occur naturally, however background concentrations for these parameters in groundwater have not been documented in Ontario. As these parameters were not identified as COPCs on the Site or associated with an APEC on the Site, at the discretion of the QPESA, they were not considered to be COCs.
METALS	Antimony	Parameters with existing SCS, one exceedance and subsequent samples meeting SCS	MW18-114D exceedance in December 2018, subsequent event in December 2018 meets SCS	Antimony was measured at a concentration of 6.2 µg/L in December 2018 at the newly installed MW18-114D. Antimony was not detected at concentrations greater than the SCS in the shallower MW18-114S nested with MW18-114D. A subsequent sample event in December 2018 had a concentration less than the SCS at 1.54 µg/L. A second sampling event is planned to confirm this result. All other samples in groundwater (100 samples) on the Phase Two Property met the SCS. Based on the available information, this parameter was determined to likely not be present at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, was not considered to be a COC for the Phase Two Property.
METALS	Arsenic	Parameters with existing SCS, one exceedance and subsequent samples meeting SCS	MW17-101D exceedance in 2017, subsequent two events in 2018 meet SCS	Arsenic was measured at 44.8 µg/L in 2017 at MW17-101D. Subsequent two sampling events in 2018 are significantly below the SCS of 25 µg/L, at 6.87 and 6.19 µg/L. Based on the available information, this parameter was determined to likely not be present at concentrations exceeding the SCS at this location; however was carried through as a COC due to detected concentrations exceeding the SCS at another location on the Phase Two Property.
METALS	Cobalt	Parameters with existing SCS, one exceedance and subsequent samples meeting SCS	OW11-II exceedance in 2017, subsequent two events in 2018 meet SCS	Cobalt was measured at 5.79/5.74 µg/L in 2017 at OW11-II. No historical analyses at this location analyzed for cobalt. Subsequent two sampling events in 2018 are less than the SCS of 3.8 µg/L, at 1.36 and <0.10 µg/L. All other samples in groundwater (90 samples) on the Phase Two Property met the SCS. Based on the available information, this parameter was determined to likely not be present at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, was not considered to be a COC for the Phase Two Property.
METALS	Lead	Parameters with existing SCS, one exceedance and subsequent samples meeting SCS	OW07-33 exceedance in 2017, subsequent two events in 2018 meet SCS	Lead was measured at 15/15.6 µg/L in 2017 at OW07-33. A sample collected in 2007 met the SCS of 10 µg/L with a concentration of 4.07 µg/L along with two subsequent sampling events in 2018, at 8.9 and 7.37/7.68 µg/L. Based on the available information, this parameter was determined to likely not be present at concentrations exceeding the SCS at this location; however was carried through as a COC due to detected concentrations exceeding the SCS at another location on the Phase Two Property.
METALS	Uranium	Parameters with existing SCS, one exceedance and subsequent samples meeting SCS	OW22S exceedance in 2017, subsequent two events in 2018 meet SCS	Uranium was measured at 25.9 µg/L in 2017 at OW22S. No historical analyses at this location analyzed for uranium. Subsequent two sampling events in 2018 were less than the SCS of 20 µg/L , at 7.24 and 6.05 µg/L. All other samples in groundwater (84 samples) on the Phase Two Property met the SCS. Based on the available information, this parameter was determined to likely not be present at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, was not considered to be a COC for the Phase Two Property.

Table 6-10b. Rationale for the Removal of Groundwater COCs

200 Beverley Street, Guelph, Ontario

Parameter Group	Parameter	Category	Sample(s)	Comment/Rationale
METALS	Zinc	Parameters with existing SCS, one exceedance and subsequent samples meeting SCS	OW26S exceedance in 2012, subsequent three events meet SCS; OW12 exceedance in 2010, subsequent three events meet SCS.	Zinc was measured at concentrations of 900 µg/L and 910 µg/L at OW26S and OW12, respectively. Historical analyses at these locations had zinc concentrations less than the SCS. Three subsequent sampling events at each location (in 2013, 2014, and 2017 for OW26S; and in 2011 [two samples] and 2017 for OW12) had concentrations of zinc less than the SCS. Based on the available information, this parameter was determined to likely not be present at concentrations exceeding the SCS at these locations; however, was carried through as a COC due to detected concentrations exceeding the SCS at another location on the Phase Two Property.
PAH	Acenaphthylene	Parameters with existing SCS but RL exceedances only	OW23S and OW22S with RL exceedances from 2012 to 2016.	Groundwater samples from OW23S (5 samples) and OW22S (1 sample) had raised RLs for up to five events between 2012 and 2016. Laboratory reports noted that detection limits were adjusted as the sample required dilution due to the nature of the sample matrix. The raised RL at OW23S is likely due to LNAPL interference, as there has been consistent measurement of free product in this well. Samples taken at OW23S (parent and duplicate) in 2018 reported detected concentrations less than the SCS. All other samples collected at OW22S met the SCS (2012 to 2015, and 2018). The remaining 170 samples collected from other locations on the Site had concentrations less than the SCS (7 samples) or non detected concentrations, with RLs meeting the SCS of 1 µg/L. Based on the available information, this parameter was determined to likely not be present at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, was not considered to be COCs for the Phase Two Property.
PAH	Benzo(g,h,i)perylene Dibenzo(a,h)anthracene Indeno(1,2,3-Cd)Pyrene	Parameters with existing SCS but RL exceedances only	8 samples from 3 locations (OW22S, OW23S, OW25) with RL exceedances of the SCS from between 2011 to 2016.	Groundwater samples from OW23S (5 samples), OW22S (2 samples) and OW25 (one sample) had raised RLs for up to five events between 2011 and 2016. Some of the laboratory reports noted that detection limits were adjusted as the sample required dilution due to the nature of the sample matrix, and it is likely that all 8 samples required dilution, causing the detection limits to be adjusted accordingly. The raised RL at OW23S is likely due to LNAPL interference, as there has been consistent measurement of free product in this well. Samples taken at OW23S in 2018 reported detected concentrations less than the SCS. All other samples collected at OW22S (2013 to 2015, and 2018) and OW25 (2010 to 2017) met the SCS. The remaining 160 samples collected from other locations on the Site had concentrations less than the SCS (6 samples) or non detect concentrations with RLs meeting the SCS of 0.2 µg/L. Based on the available information, these parameters were determined to likely not be present at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, were not considered to be COCs for the Phase Two Property.
PCB	PCBs, Total	Parameters with existing SCS, one exceedance and subsequent samples meeting SCS	OW26S exceedance in 2010, subsequent two events in 2018 meet SCS	PCBs were measured at 1.27 µg/L in 2010 at OW26S. Subsequent sampling events in 2011, 2017 and 2018 and were reported with non-detect concentrations, and RLs less than the SCS of 0.20 µg/L. All other samples in groundwater (24 samples) on the Phase Two Property met the SCS. Based on the available information, this parameter was determined to likely not be present at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, was not considered to be COCs for the Phase Two Property.
PHCs	PHC F2	Parameters with existing SCS, one exceedance and subsequent samples meeting SCS	OW18-II exceedance in 2015, subsequent two events meet SCS	PHC F2 was measured at 210 µg/L in 2015 at OW18-II in November 2015. Six previous sampling events (2010, 2011 [two samples], 2012, 2013, and 2014) and two subsequent sampling events (2016 and 2017) reported concentrations less than the SCS. Based on the available information, this parameter was determined to likely not be present at concentrations exceeding the SCS at this location; however was carried through as a COC due to detected concentrations exceeding the SCS at another location on the Phase Two Property.
SVOC	Benzo(e)pyrene	Parameters with no Table 6 SCS or PGMIS value, but have detected concentrations	1 sample from OW22S with a detected concentration in 2013	One of 15 samples (only analyzed in 2013) had a detected concentration of 0.065 µg/L of benzo(e)pyrene. Benzo(e)pyrene was run as part of a historical PAH laboratory scan, and was not a targeted as a COC for the area. The remaining 14 locations where benzo(e)pyrene was analyzed did not report detected concentrations. As this parameter was not identified as COPCs on the Site or associated with an APEC on the Site, at the discretion of the QPESA, it was not considered to be COCs for the Phase Two Property.

Table 6-10b. Rationale for the Removal of Groundwater COCs

200 Beverley Street, Guelph, Ontario

Parameter Group	Parameter	Category	Sample(s)	Comment/Rationale
VOC	1,1,1,2-Tetrachloroethane 1,1,2,2-Tetrachloroethane 1,1,2-Trichloroethane 1,2-Dibromoethane 1,2-Dichlorobenzene 1,2-Dichloroethane 1,2-Dichloropropane 1,3-Dichloropropene 1,4-Dichlorobenzene Bromoform Bromomethane Carbon tetrachloride Styrene	Parameters with existing SCS but RL exceedances only	All samples with RL exceedances between 2010 and 2015	VOC parameters noted had RL exceedances in a number of samples between 2010 and 2015. All locations were resampled in 2017 and 2018 and had reported non-detect concentrations with RLs meeting the SCS. No other locations reported exceedances of the SCS for these parameters. Based on the available information, these parameters were determined to likely not be present at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, were not considered to be COCs for the Phase Two Property.
VOC	1,3-Dichlorobenzene 2-Butanone Acetone Chlorobenzene	Parameters with existing SCS but RL exceedances only	OW24D RL exceedances in 2015	One sample collected at OW24D had RL exceedances for each of the noted VOCs in 2015. All other samples collected from this location between 2010 and 2018 (seven events) reported non detect concentrations with RLs meeting the SCS. All other samples collected on the Phase Two Property had non detected concentrations of the noted VOCs, with the exception of 2 samples that had detected concentrations of acetone less than the SCS. Laboratory reports indicated that detection limits were adjusted as the sample required dilution due to high concentrations of other target analytes. Based on the available information, these parameters were determined to likely not be present at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, were not considered to be COCs for the Phase Two Property.
VOC	4-Methyl-2-Pentanone Chlorodibromomethane Bromodichloromethane Dichloromethane Methyl tert-butyl ether (MTBE)	Parameters with existing SCS but RL exceedances only	OW24D RL exceedances of the SCS in 2010, 2011, 2012, 2014, and 2015.	6 samples collected from OW24D had RL exceedances for each of the noted VOCs between 2010 and 2015. Samples from 2016 and 2017 reported non detect concentrations with RLs meeting the SCS. The remaining samples on the Phase Two Property also had non detected concentrations of the noted VOCs less than the SCS. Laboratory reports indicated that detection limits were adjusted as the sample required dilution due to high concentrations of other target analytes. Based on the available information, these parameters were determined to likely not be present at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, were not considered to be COCs for the Phase Two Property.
VOC	1,1,1-Trichloroethane 1,1-Dichloroethane	Parameters with existing SCS and both RL and detected exceedances	Samples from OW24D with RL exceedances between 2010 and 2015	VOC parameters noted had RLs exceeding the SCS at OW24D from samples collected between 2010 and 2015. Detected exceedances were noted elsewhere on the property: 1,1,1-trichloroethane exceeded the SCS at OW12; 1,1-dichloroethane exceeded the SCS at OW26S; both more than 200 metres away (downgradient) on the western portion of the property. Samples collected in 2017 and 2018 from OW24D had non-detect concentrations reported with RLs meeting the SCS. Based on the available information, these parameters were determined to likely not be present at OW24D at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, the elevated RLs were not carried through for the dataset for the Risk Assessment. The parameters were retained as a COCs for the Phase Two Property based on other locations exceeding the SCS.
VOC	n-Hexane Tetrachloroethene	Parameters with existing SCS and both RL and detected exceedances	Samples with RL exceedances between 2010 and 2015	N-hexane had noted RLs exceeding the SCS from several samples collected between 2010 and 2015. Detected exceedances were only noted at MW17-105S for n-hexane and OW19 and MW17-107S for tetrachloroethene. Locations with RLs only exceeding the SCS had samples meeting the SCS in two or more other sampling events. Based on the available information, these parameters were determined to likely not be present at concentrations exceeding the SCS at the locations with the elevated RLs; therefore at the discretion of the QPESA, the elevated RLs were not carried through for the dataset for the Risk Assessment. These parameters were retained as a COC for the Phase Two Property based on other locations exceeding the SCS.
VOC	1,1,2,2-Tetrachloroethane 1,1,2-Trichloroethane 1,2-Dibromoethane	Parameters with existing SCS but RL exceedances only	Two samples from OW22S has RL exceedances of the SCS in 2017 and 2018.	These VOCs had elevated RLs in two samples collected in 2017 and 2018. Both the laboratory reports noted that the detection limits were adjusted due to "to interference from volatile hydrocarbons on VOC method. Chromatographic elution of interfering peaks in the same region as test analytes prevents a determination of whether VOC analyte is present or absent (above/below regular detection limits)." The RLs for these VOCs met the SCS in three prior sampling events at this location. Based on the available information, these parameters were determined to likely not be present at OW22S at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, were not considered to be COCs for the Phase Two Property.

Table 6-10b. Rationale for the Removal of Groundwater COCs

200 Beverley Street, Guelph, Ontario

Parameter Group	Parameter	Category	Sample(s)	Comment/Rationale
VOC	Chloroform	Parameters with existing SCS but RL exceedances only	14 samples from 5 locations had RL exceedances of the SCS from 2010 to 2015.	14 of 232 samples analyzed for chloroform had RL exceedances of the SCS. 200 of the remaining 218 samples had non detected concentrations below the SCS, 8 had detected concentrations below the SCS. Some of the laboratory reports noted that detection limits were adjusted as the sample required dilution due to high concentrations of other target analytes. Due to the presence of high concentrations of VOCs on the Site, it is likely that the samples required dilution, causing the detection limits to be adjusted accordingly. Based on the available information, this parameter was determined to likely not be present at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, was not considered to be a COC for the Phase Two Property.
VOC	Chloroform	Parameter with "introduced" exceedance	1 sample from MW18-112G had a detected exceedance of the SCS from December 2018.	The initial groundwater sample collected on November 22, 2018 from MW18-112D after drilling/bedrock coring, purging, and well development had a concentration of 5.8 µg/L greater than the SCS of 2 µg/L. The source of the chloroform exceedance was believed to be related to the municipal water that was used during the bedrock coring process. Two samples, one from the water truck and one from the water truck hose that was used during the coring activities were analyzed for VOCs. All VOCs were non detect in these samples apart from bromodichloromethane (12.5 to 12.9 µg/L), dibromochloromethane (11.5 to 11.8 µg/L), and chloroform (9.8 to 10.1 µg/L). These analytes are trihalomethanes that are typically present in municipally-treated water. Two subsequent groundwater samples were collected on November 29 and December 3, 2019 with non detect concentrations of chloroform less than the SCS. Based on the available information, this parameter was determined to likely not be present at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, was not considered to be a COC for the Phase Two Property.

Notes:

The rationale for exclusion of COCs listed in this table is based on the data collected as part of the ESA and only applies to this ESA.

µg/L = micrograms per gram
ABN = acid, base, and neutral compound
APEC = area of potential environmental concern
COC = contaminant of concern
COPC = contaminant of potenical concern
CP = chlorophenol
ESA = Environmental Site Assessment
mbgs = metre(s) below ground surface
RL = laboratory reporting limit
MECP = Ontario Ministry of the Environment, Conservation and Parks
No. = number
OCP = organochlorine pesticide
PAH = polycyclic aromatic hydrocarbon
PCA = potentially contaminating activity
PCB = polychlorinated biphenyl
PHC = petroleum hydrocarbon
QPESA = MECP Qualified Person for Environmental Site Assessment
RSC = Record of Site Condition
SCS = Site Condition Standards
VOC = volatile organic compound

Attachment B
Phase Two Conceptual Site Model

Phase Two Conceptual Site Model

Based on recent and historical Phase Two Environmental Site Assessment (ESA) work completed at 200 Beverley Street (Phase Two Property or Site) in Guelph, Ontario, a Phase Two CSM is provided and discussed in this attachment, as required under Ontario Regulation (O. Reg.) 153/04 (MECP, 2011a). The Site is located east of downtown Guelph, Ontario, and is approximately 5.2 hectares (ha) in size. The Site currently consists of vacant land historically used for industrial purposes. All onsite buildings have been razed, with concrete floor slabs still in place. Further details regarding the Phase Two Property are provided in Attachments A1 and A2. The location of the Phase Two Property is shown on Figure 2-1 (Attachment A1), and a more detailed Site Plan is shown on Figure 2-2 (Attachment A1).

Potentially Contaminating Activities

The Phase One ESA (CH2M, 2017) identified 77 potentially contaminating activities (PCAs) resulting in 33 areas of potential environmental concern (APECs). The following PCAs were identified during the Phase One ESA (CH2M, 2017) on the Phase Two Property, and resulted in an APEC:

- 8 – Chemical Manufacturing, Processing, and Bulk Storage
- 27 – Garages and Maintenance and Repair of Railcars, Marine Vehicles, and Aviation Vehicles
- 28 – Gasoline and Associated Products Storage in Fixed Tanks
- 30 – Importation of Fill Material of Unknown Quality
- 32 – Iron and Steel Manufacturing and Processing
- 33 – Metal Treatment, Coating, Plating and Finishing
- 34 – Metal Fabrication
- 39 – Paints Manufacturing, Processing or Bulk Storage
- 46 – Rail Yard, Tracks, and Spurs
- 55 – Transformer Manufacturing, Processing and Use

The following PCAs were identified during the Phase One ESA (CH2M, 2017) outside the Phase Two Property, but within the Phase One Study Area:

- 8 – Chemical Manufacturing, Processing, and Bulk Storage
- 10 – Commercial Autobody Shops
- 11 – Commercial Trucking and Container Terminals
- 12 – Concrete, Cement and Lime Manufacturing
- 27 – Garages and Maintenance and Repair of Railcars, Marine Vehicles, and Aviation Vehicles
- 28 – Gasoline and Associated Products Storage in Fixed Tanks
- 33 – Metal Treatment, Coating, Plating and Finishing
- 34 – Metal Fabrication
- 39 – Paints Manufacturing, Processing or Bulk Storage
- 43 – Plastics (including Fiberglass) Manufacturing and Processing
- 45 – Pulp, Paper and Paperboard Manufacturing and Processing
- 46 – Rail Yard, Tracks, and Spurs
- 49 – Salvage Yard, including Automobile Wrecking
- 55 – Transformer Manufacturing, Processing and Use
- 57 – Vehicles and Associated Parts Manufacturing

Areas of Potential Environmental Concern

As indicated, the Phase One ESA (CH2M, 2017) identified several PCAs that resulted in APECs for the Phase Two ESA. As summarized from the Phase One ESA, 33 APECs were identified on the Site, with

29 attributable to onsite PCAs, and 4 APECs attributable to offsite PCAs located within 250 metres (m) of the Phase Two Property.

The following APECs were identified for the Phase Two Property:

1) Foundry - A foundry was operated on the site by IMICO from 1913 to 1989 when the plant closed and was abandoned. The foundry operated as an iron-jobbing facility for the production of various metallic forms using malleable and ductile iron (DCS, 2014). Foundry sands were predominantly located in the concrete pits and sumps of the main Foundry building. Foundry sands, sludge materials, and process waste were removed from the site and buildings were demolished in 1999 (Earth Tech, 1999). The P&R investigation also reported that moulding sands and dust collector waste was stored at the north west corner of the building and drained to the truck bay (P&R, 1991).

2) Machine Shop - A machine shop was shown on the 1916 FIP, east of the original foundry. The northern one-third of the Machine Shop was identified for 'Tumbling and Cleaning' operations, inferred to be in association with the adjacent 'Annealing Room' to the north. FIPs prepared in 1929, 1945 and 1960 showed this area changed operations to 'Shipping' and a 'Pattern Shop'.

3) Annealing - An 'Annealing Room' with four furnaces is shown on the 1916 FIP. A brick chimney is located on the north wall. The 1929 FIP shows nine furnaces with the Annealing Room extended westward with an additional chimney on the north wall within the extended area; the southern portion of the Annealing Room is identified as the 'Tumbling Dep't'. The 1946 FIP shows a structural addition on the east side of the Annealing Room, with two additional furnaces. The 1960 FIP shows further eastward expansion and the addition of a third furnace. Tumbling Dep't operations appear consistent in location and footprint, from 1929 through to 1960. The furnaces are inferred to be coal fired from 1916 through to 1960, based on the nearby coal storage areas shown on the 1946 and 1960 FIPs, and the absence of ASTs or USTs for fuel oil storage on any of the FIPs. The furnace fuel from after 1960 to the end of operations in 1989 is not known, but a period of fuel oil fired operation of the furnaces is suspected; see APEC 7. No information was identified to suggest coal or fuel oil storage within the Annealing Room; however, no information regarding temporary furnace fuel storage, transmission or waste disposal was identified. Dust control equipment is shown on Figure 4 of the 1991 P&R report, on the north side of the Annealing Room.

4) Sand Storage - The 1916 FIP shows a 'Sand Shed'. The 1929 and 1946 FIPs again show the Sand Shed, plus a second smaller building to the west labelled 'Sand'. The 1960 FIP shows the original 'Sand Shed' as 'Bricks' and the second smaller building to the west labelled as 'Sand & Bricks', and an additional area to the north labeled 'Sand'. No information was identified to if only clean process, spent foundry sands or both were stored in these buildings, therefore the potential storage of spent foundry sand in these buildings is considered. The purpose and types of bricks stored was not identified. The potential for new and used refractory brick and associated process materials is considered possible.

5) Galvanizing Building - A small free-standing building for 'Galvanizing' was present on the south east portion of the Site as shown on the 1916, 1929 and 1946 FIPs. The Galvanizing building was not shown on the 1960 FIP, with the area occupied by a larger new structure identified as 'Fittings Whse' (warehouse). No information was identified regarding process chemical use and storage, or waste management practices, in association with the galvanizing operations conducted.

6) Chipping/Grinding Room - A 'Chipping Room' was shown on the FIPs prepared in 1929, 1946 and 1960, located west of the Annealing area. The 1916 FIP shows this as exterior yard area west of the 'Annealing Rm', with a small outbuilding that appears to be connected to the Annealing

Room with a linear underground feature. The 1991 P&R report identified this as a 'Trimming and Grinding' area; this information inferred to be based on the interview of historical IMICO employees. 'Dust control equipment' is shown on Figure 4 of the 1991 P&R report, on the exterior west side of the building.

7) Oil Houses, Boiler House and ASTs - A building is shown on the 1929 FIP to the north of the Foundry and east of the power house with a label "Oil", and an additional building with the same label is shown to the north of this original building on the 1946 FIP. The 1960 FIP shows the north building remaining, but is not labeled as an oil house. The 1916 FIP shows this as empty exterior yard area north of the foundry. The P&R Investigation figures show a boiler house to the east of the power house, and two 45,000-L (10,000 gallon) oil tanks to the east of the building with "no history of leaks or spills" (P&R, 1991). One 45,000-L AST was reported removed in 1998 during demolition activities and had been used to store Bunker C fuel. The AST removed had been located east of the Core Room (Earth Tech, 1999).

8) Gasoline UST - As indicated on the 1960 FIP, a gasoline UST is shown north of a small office building, and west of 'scales' at the corner of Kingsmill Avenue and Beverley Street. The area is empty exterior yard area on the 1916 FIP, and the 1929 and 1946 FIPs show the office (labeled as a 'time office'), but does not show the UST. The gasoline use is not known, however it is inferred to be for fueling gasoline-powered equipment/vehicles used at the plant. The 1991 Proctor & Redfern investigation reported that an IMICO employee indicated the UST was removed in the mid-1980s in response to a request from the City due to gasoline vapours in the sewers along Beverley and York Streets. No significant contamination was reported (P&R, 1991).

9) Oil House - A building is shown on the 1929 and 1949 FIP to the south of the Foundry and west of the galvanizing building with a label "Oil". The building/structure is not on 1916 FIP where the area is shown as exterior yard area, and is not present on the 1960 FIP where the area is occupied.

10) Machine Shop - A machine shop is shown on the 1929, 1946 and 1960 FIP, east of the original foundry building. The floor is indicated as concrete. Machine shop cuttings were stored on the ground north of the building, and two small ceiling mounted oil tanks were present in the building as noted in the P&R investigation (1991). The area is shown on the 1916 FIP as exterior yard area, with a small unidentified building in the central area of the future machine shop.

11) Plating/Galvanizing Building - A galvanizing building was present on the Site as shown on the 1946 and 1960 FIP. The previous FIPs (1916 and 1929) show this as exterior yard area. On subsequent site plans (P&R, 1991; Earth Tech 1999), the building was identified as a storage shed and reported as having been used for dip galvanizing before 1975, with rinse water discharged into "dry wells" north of the building (P&R, 1991). Investigations by P&R and Gartner Lee indicated high concentrations of zinc, other metals, and oil & grease. Free product was observed wells (OW01-I, OW20, OW21). The area was excavated to bedrock (ranging from 1.3 to 2.0 mbgs and approximately 9,400 tonnes of contaminated soil and 925 tonnes of contaminated concrete were removed. Soil samples were collected from the final limits of the excavation walls and indicated most locations having zinc and TPH concentrations above the Table A Guidelines. The excavation was backfilled with granular "B" materials. A single sample was collected from the backfill and met the guidelines applicable at the time of the report (Earth Tech, 1999). A well nest (OW22S/D) was installed within the excavation area (the report for this installation was not available and therefore the soil conditions are unknown if analyzed as part of the investigation). Testpits and boreholes installed in the area in 2013 by DCS indicated soils having high zinc and other metal concentrations. Groundwater conditions at OW22S reported free product which was highly weathered with a slight oil/diesel odour (as reported in the summary of the Gartner Lee 2000/2001 investigation in DCS, 2007a). Borehole logs for OW22S/D indicate the presence

of fuel/diesel type odour in the fill which extends to approximately 1.5 mbgs; and hydrocarbon odour extending into the underlying bedrock with black staining on fractures. Groundwater sampled from OW22S has not since reported free product, but has had concentrations of PHCs increasing since the annual monitoring at this location began in 2016, up to 850,000 µg/L of F3. Zinc concentrations have widely fluctuated over the years and have exceeded in approximately 25% of the sampling events between 2005 and 2016.

12) Coal Storage - A coal shed is shown on the 1946 FIP, to the north of the foundry and west of the powerhouse. A larger coal storage area is shown on the 1960 FIP, and the building is extended south to connect with the foundry on subsequent site plans (P&R, 1991; GLL, 1999; Earth Tech 1999) without an indication of its use. The previous FIPs (1916 and 1929) show this area as exterior yard area.

13) Rail Line - A former rail line was shown onsite north of the buildings on the 1916, 1929 and 1946 FIPs, running east to west, for the full length of the foundry building. On the 1960 FIP, the western portion was shown to have been removed, to accommodate the newly constructed shipping/stock room; the rail siding ended at the eastern side of the building. It is inferred that raw materials and finished products were shipped by rail.

14) Possible Automobile Storage, Maintenance and Repair - An addition south of the foundry building, on the east side of the offices, is labeled "Auto" on the 1960 FIP. Previous FIPs (1916, 1929, 1946) show this as exterior yard area.

15) Sand Mixing/Storage - Sand mixing is shown in a building north of the foundry as shown on the 1960 FIP. Previous FIPs (1916, 1929, 1946) show this as exterior yard area, north of the foundry. Subsequent site plans (P&R, 1991; GLL, 1999; Earth Tech 1999) do not have an indication of the buildings use.

16) Transformers - Transformers are first shown on the 1960 FIP, north of the powerhouse. Previous FIPS (1916, 1929, 1946) show this as exterior yard area north of the power house. Transformers of this era may have contained PCBs.

17) Capacitor Room - PCB-containing capacitors were present in the centre of the foundry, as first shown on the P&R investigationsite plan, and later remediated as part of the Earth Tech demolition (P&R, 1991; EarthTech, 1999). Activities included removal of a concrete floor, a utility trench located in the eastern section (concrete walls, granular base) that was heavily stained, a subfloor was present in the central section, and a sump located in on the eastern portion of the capacitor room that were all indicated as PCB-impacted and excavated and disposed offsite. The area was excavated to bedrock (1.0 - 1.3 mbgs) to remove concentrations above 5 µg/g. Final samples (composite soil, soil, concrete and bedrock) from the limits of excavation in the capacitor room reported PCB concentrations under 5 µg/g, with the exception of two bedrock samples within the eastern sump area that had concentrations around 10 µg/g. A well (OW25) was installed within the excavation area (the report for this installation was not available and therefore the soil conditions are unknown if analyzed as part of the investigation) and subsequent groundwater monitoring of the area have indicated concentrations of chlorinated VOCs and PHCs (mainly F3) above the applicable potable water criteria (Table 6 Standards) (DCS, 2007b, 2014b; AECOM, 2017a and 2017b).

18) Coal Storage - A building for coal storage is shown on the 1960 FIP, to the north of the annealing room, with additional 'coal piled' to the west of the building. Previous FIPs (1916, 1929, 1946) show this as exterior yard area to the north of the annealing room. The coal is inferred to be used in the furnaces in the annealing room. Subsequent site plans show this as a storage area (P&R, 1991, DCS, 2007a).

19) Coal Storage - A small building for coal storage is shown on the 1960 FIP, east of the time keepers office at the Beverley Street entrance. The building is not present on previous FIPs (1916, 1929, 1946) and is shown as exterior yard area.

20) Garage - A garage was shown on the 1946 and 1960 FIP along Stevenson, on the west side of the property. The building is not present on previous FIPs (1916, 1929) and is shown as exterior yard area. The site investigation by P&R (1991) identified visual impacts to the soils south of the garage. Some elevated PCB concentrations were found in soil during subsequent investigations.

21) Coal Storage - The 1960 FIP indicates coal storage south of the garage on the west side of the Site. The building is not present on previous FIPs (1916, 1929) and is shown as exterior yard area, and on the 1946 FIP, the building is not labeled as coal.

22) Transformer - A 1200-volt transformer is shown on the 1991 Site Plan (P&R, 1991).

23) Paint Shop - First shown on the P&R Site plan, a paint shop was located at the north end of the site, between the shipping building and the storage area (P&R, 1991). Drums were stored against the north wall for materials used in the paint shop. The FIPs show this area as exterior yard area in the early FIPs (1916, 1929, 1946) and empty space between existing buildings in the 1960 FIP.

24) PCB Storage Area - An area located at the northeast corner of the finishing and annealing room, with a concrete pad was identified in the Earth Tech investigation as a former PCB Storage area. Concentrations above 50 ppm of PCBs were identified. Previous site maps showed this area as 'storage' (P&R, 1991) or part of the Annealing Room (1946 and 1960 FIPs). During the demolition activities, approximately 250 kg of PCB-containing ash residue from the top of the concrete pad, and the concrete pad itself was removed and taken for offsite disposal (Earth Tech, 1999). Confirmatory samples below the pad were 0.63 and <0.05 ug/g. The soil was later excavated to bedrock as part of the soil remediation in the northeast corner of the property (see APEC-11).

25) Drum Storage - Interviews with former employees as part of the P&R investigation identified drum storage activities which occurred along the north property boundary (P&R, 1991). No additional information was provided on the nature of what was stored and whether there was any associated contamination as a result of the materials.

26) Former Substation - A former substation is indicated on the P&R (1991) and Earth Tech (1999) site plans. A sample of transformer oil from the former substation analyzed in the Earth Tech report indicated non-detect concentrations of PCBs. Similarly, one location installed during the DCS Phase II ESA (2007) indicated non-detect PCB concentration. Previous site plans (FIPs) show this area as exterior yard areas.

27) Former Electrical Shop - A small electrical shop was noted to be on the southwest corner of the foundry (P&R, 1991). This addition was not shown on the FIPs from previous years, and was shown as the exterior yard area west of the foundry.

28) Waste Oil Storage - Used oil was stored above ground on the southwest end of the foundry as shown on the P&R Site Plan (P&R, 1991).

29) Fill of Unknown Quality - All areas of the Site have a layer of fill above the native silty sands. Previous investigations have indicated a layer of fill consisting of foundry sands, slag and cinders (up to 1.0 m) was found across the site (P&R, 1991) and the fill to be mix of foundry operation waste such as "coal, clinker, ash, metals and detritus from the former foundry operations" and reworked native from "reworking onsite soils as a result of initial construction and subsequent expansion activities" (DCS, 2007b). The yard areas were additionally noted to have been oiled (presumably engine oil) (P&R, 1991).

30) Potential Offsite Impacts from the North – Historical and current operations on properties to the north have the potential to impact the Phase Two Property, including the following:

- Rail lines
- Paper manufacturing
- Auto body repair shop
- Automobile repair
- Gasoline station
- Trucking company
- Concrete products manufacturing
- Wire/spring manufacturing
- Metal valve manufacturing
- Former spill
- Electroplating company
- Window and door manufacturing
- Scrap yard

31) Potential Offsite Impacts from the East – Historical and current operations on properties to the east have the potential to impact the Phase Two Property, including the following:

- Steel valve manufacturing
- Former stove manufacturer/foundry
- Box manufacturing
- Potential USTs
- Scrap yard
- Former fuel storage facility
- Former pain application
- Chemical manufacturer or distributor
- Transformers

32) Potential Offsite Impacts from the South – Historical and current operations on properties to the south have the potential to impact the Phase Two Property, including the following:

- Screw manufacturing
- Former USTs
- Former transportation company

33) 33) Potential Offsite Impacts from the West – Historical and current operations on properties to the west have the potential to impact the Phase Two Property, including the following:

- Window manufacturing
- Metal treatment
- Spring manufacturing
- Former refractory facility
- Motor vehicle parts manufacturing
- Former spill

Table 6-4 describes the APECs and associated PCAs. Figure 4-1 presents the location of the APECs on the Phase Two Property along with the locations of boreholes, test pits, and monitoring wells advanced as part of the Phase Two ESA investigations. As summarized in Table 6 4, the APECs occurring on the Phase Two Property have been thoroughly investigated for all associated contaminants of concern (COCs). Additional investigations were initiated in November 2018, the sampling and analysis plan (SAP) for this work is included as Attachment C.

Subsurface Structures and Utilities

Some concrete foundations, slabs and footings from the former buildings are present on Site, below grade, along with associated building demolition debris (for example, crushed concrete, industrial fill). Although utilities have been disconnected on Site, piping and bedding have not been removed and, therefore, there is a potential for utility corridors to act as preferential route of contaminant migration. The specific locations of former utility corridors are not known. Former building outlines are shown on Figure 2-2 (Attachment A1).

Physical Setting

Stratigraphy

The geology at the Phase Two Property was investigated through historical investigations and the 169 sampling locations (that is, boreholes, monitoring wells, and test pits) advanced as part of the Phase Two ESA activities and historical investigations. The geology beneath the site characterized during the Phase Two field investigations is summarized in Exhibit 1.

Exhibit 1: Site Stratigraphy

Geologic Unit	Description/ Bedrock Member	Approximate Thickness (m)	Lithology
Fill		0.1 to 4.3	Dark brown to black silty sands (like foundry sand) with black ash, brick, cinders, metal and wood debris
Silty Fine Sand		0 to 3.0	Silty fine sand
Guelph Formation		1.7 to 5.8	Dolostone: Medium to thickly bedded crinoidal grainstones and wackestones with reefal complexes
Eramosa Formation	Stone Road Member		Cream coloured coarsely crystalline dolostone
	Reformatory Quarry Member	6.4 to 9.6	Light brown to cream, thinly to thickly bedded, coarsely crystalline dolostone
	Vinemount Member	6.4 to 9.6	Dark grey to black, thin bedded, finely crystalline dolostone with shaley beds
Goat Island Formation		> 8.5	Medium to ash grey, chert-rich, finely crystalline dolostone

Notes:

m = metre

> = greater than

The Guelph, Eramosa, and Goat Island Formations underlie the Phase Two Property and the top of bedrock surface was encountered at depths ranging from approximately 1.0 m to 3.4 metres below ground surface (mbgs) (approximately 312.6 to 314.6 metres above sea level [masl]). The upper few metres of bedrock in the area are highly weathered and fractured, and the bedrock becomes increasingly more competent and less fractured with depth below surface.

Seven geologic cross sections were generated to illustrate the stratigraphy beneath the Site. The cross-section locations are shown on Figure 6-1 and cross sections A-A' through G-G' are presented on Figures 6-1a through 6-1g, respectively.

During the Phase Two ESA, the fill, native silty fine sands and all units of the bedrock from the Guelph Formation to the Goat Island Formation (Exhibit 1) were investigated. Monitoring wells were

instrumented in the upper sands and fractured Guelph Formation and Stone Road Member bedrock to characterize the water table, and monitoring wells were also installed in the Reformatory Quarry and Vinemount Members of the Eramosa Formation, to characterize the lower bedrock beneath the site. The deepest well onsite extends approximately 33 mbgs (OW31) into the top of the Goat Island Formation.

Hydrogeological Characteristics

The Phase Two Property is located in the City of Guelph, within the Speed River Subwatershed of the Grand River Watershed. Regional topography (Figure 3-1) is characterized by broad and oblong drumlins (hills) with gentle slopes, with poorly drained till plain valley that are part of the Guelph Drumlin Field (Chapman and Putnam, 1984). The property area lies at an elevation of approximately 315.5 masl, with a topographic high of approximately 316.5 masl at OW13, which lies in the southeastern portion of the site (Figure 6-1).

On a regional scale, groundwater flows from areas north of the city to the south towards Cambridge. Within the City, groundwater flow is influenced by groundwater pumping from municipal water supply wells, as well as creek and rivers, including the Speed and Eramosa Rivers. The site lies approximately 0.5 kilometres (km) north of the Eramosa River, and 1.1 km east of the Speed River, and flow in both rivers is supported by groundwater discharge. The nearest municipal wells to the Site include the Clythe Creek Well (approximately 2.5 km northeast of the Site), the Water Street Well (approximately 2.5 km southwest of the Site), and the Park and Emma Wells (approximately 2 km north/ northwest of the Site). Review of the Permit to Take Water database identified 4 Permits to Take Water within one kilometer of the Site, which include an industrial water user north of the Site, remediation wells east of the Site, and dewatering and commercial uses located south-southeast of the Site.

Hydrostratigraphic Units: To evaluate groundwater flow directions onsite, the geologic units beneath the site were subdivided into the following three hydrostratigraphic units.

- *Overburden and bedrock contact zone*. This unit is characterized by wells completed in the Guelph Formation, and the Stone Road Member of the Eramosa Formation. This hydrostratigraphic unit acts as a local and regional groundwater aquifer with groundwater flow in the upper fractured bedrock influenced by secondary porosity features, such as fractures and solution enhanced vugs and cavities.
- *Eramosa Formation.* Reformatory Quarry and Vinemount Members. Based on review of onsite drill core and our regional understanding of the bedrock formations in the area, the Reformatory Quarry and Vinemount Members of the Eramosa Formation are notably less fractured, and more competent than the overlying Guelph Formation and Stone Road Member of the Eramosa Formation, and they act as a regional aquitard.
- *Goat Island Formation*. The Goat Island Formation is interpreted on a regional scale to act as a regional aquifer beneath the City of Guelph; however, in some areas, the upper member of the Goat Island Formation (Ancaster Member) contains low permeability shaley beds that have similar hydrogeologic properties of the overlying Vinemount Member, and acts as a local aquitard. To be conservative, we have assumed the Goat Island Formation bedrock beneath the site behaves as an aquifer and lies in contact with the underlying Gasport Formation aquifer, which is the City of Guelph's primary water supply aquifer.

The characterization of the hydrostratigraphic units was based on data collected from 93 locations across the Site, which included 36 wells installed in previous investigations, and 57 wells drilled and instrumented in the current investigation between August 2017 and December 2018. The current investigation also included drilling of 10 boreholes and digging of 20 test pits that assessed the nature of the subsurface from ground surface to a maximum depth of approximately 25 mbgs.

Of the 93 monitoring wells onsite, 56 wells are completed in the uppermost hydrostratigraphic unit (Overburden and bedrock contact zone), 36 in the middle hydrostratigraphic unit (Competent Eramosa Formation) and one in the Goat Island Formation.

Approximate Depth to Bedrock

Depth to bedrock onsite ranges from 1.0 to 3.4 mbgs. The elevation at the top of bedrock is deepest onsite at MW18-127S (312.6 masl) in the central portion of the site and rises to a high of 314.6 masl at OW23D in the eastern portion of the site where the bedrock rises slightly (less than 2 m) in comparison to the bedrock surface observed in the surrounding wells.

Approximate Depth to Water Table

The measured depth to water table collected in August 2018 ranged from 2.6 to 4.8 mbgs (312.5 to 313.3 masl) for wells screened in the overburden and contact zone unit. Depth to water in December 2018 was comparable, ranging from 2.2 to 4.6 mbgs (312.7 to 313.8 masl). Water level measurements have been collected in onsite monitoring wells since 2010, and aside from seasonal variability, the depth to water table elevation has remained consistent across the site throughout this period. Considering 22 water level events (2010 to 2018), the depth to groundwater ranged from 0.93 to 4.97 mbgs, with an average of 2.82 mbgs.

Water table elevations collected in August and December of 2018 were mapped and are illustrated on Figures 6-2a and 6-2b, respectively. Within the overburden and contact zone aquifer unit, groundwater flows from a high in the northeastern portion of the Site, to lower water level elevations in the southern and southwestern portions of the site (Figures 6-2a and 6-2b). Horizontal hydraulic conductivity values estimated from slug tests conducted in monitoring wells screened in this upper hydrostratigraphic unit yielded averaged values of 2.4 x 10-5 metres per second (m/s). The average horizontal hydraulic gradients within this unit were estimated to range from 0.006 to 0.027 m/m in August and December 2018, which together with the estimated horizontal geometric mean, and a porosity value in the fractured rock of 0.10 yielded a horizontal velocity that ranged from 42 to 200 metres per year (m/yr).

The water level elevations observed in the ***competent Eramosa Formation bedrock unit*** beneath the Site in August and December of 2018 were mapped and are illustrated on Figures 6-2c and 6-2d, respectively. Groundwater level elevations were observed to be highest in the western portions of the site near MW18-120D and decrease slightly (approximately 0.2 m) to the east to a low elevation at OW13-39D (Figure 6-2c and 6-2d). A representative horizontal hydraulic conductivity value of 4×10^{-8} m/s was estimated from a slug test result conducted on a monitoring well screened in the Vinemount Member. This estimate is consistent with the understanding that the Vinemount Member of the Eramosa Formation is a regional aquitard.

Assuming a horizontal hydraulic gradient between 0.0003 and 0.009 m/m, a porosity value of 0.05 and a geometric mean hydraulic conductivity value of 3×10^{-5} m/s, groundwater in this lower bedrock unit was calculated to move horizontally at a velocity of less than 1 m/yr through this aquitard unit.

Within the Goat Island Formation bedrock unit, horizontal hydraulic conductivity values estimated from hydraulic tests conducted in June 2018 in OW31, screened across this unit, was estimated to be 3.8×10^{-7} m/s. As only two wells are screened across the Goat Island Formation, groundwater flow directions and gradients were not characterized for this unit.

Vertical gradients were calculated onsite using twenty nested monitoring wells present on the Site. Downward gradients were noted at all wells across the Site on multiple occasions, except MW18-112S and MW18-112D. In August and December 2018, the well pair exhibited a slight (4 and 3 cm) upward (negative) gradient.

Within the upper aquifer, groundwater flow onsite is conceptualized to flow from the north to the south and southwest towards the Eramosa River, a groundwater discharge location. Drill cores collected from

the Site also showed that horizontal fractures were most common in the upper portions of the bedrock and decreased with depth. The combination of the predominant horizontal fracturing onsite, and the nearby (500 m) Eramosa River groundwater discharge location lead to the horizontal gradients beneath the Site.

Applicable Site Condition Standards

O. Reg. 153/04 (MECP, 2011a) under Part XV.1 of the Environmental Protection Act addresses the assessment, cleanup, and filing of an RSC for brownfield sites in Ontario and is applicable to the Phase Two Property. CH2M evaluated the Site based on a number of criteria to decide which of the generic SCS provided in the Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act (MECP, 2011c), were applicable for a comparison of soil and groundwater results from the Phase Two ESA investigation.

The items in Table 2-3 (Attachment A2) were considered during the selection of the SCS, as outlined in O. Reg. 153/04, as amended (MECP, 2011a).

The special conditions for environmentally sensitive areas under Section 41 of O. Reg. 153/04 are potentially applicable to the Phase Two Property, as soil pH was found to range from 6.6 to 10.64 based on 91 soil samples. As discussed in Table 2-3, with the exception of two samples, the remainder of the soil samples were found to have a pH value within the Ministry's acceptable range (that is, a pH value in surface soil between 5 and 9, or a pH value in subsurface soil between 5 and 11). One of these soil samples with elevated pH has been classified as "isolated fill" and is not considered to be representative of soil conditions at the Site. At this location, concrete foundations were noted to be present both above and below the sample, essentially isolating this fill from other overburden soils. As such, this pH result was not considered further for the determination of pH at the Phase Two Property. A proposed sampling program is included in Attachment C to address the remaining single elevated pH value in soil through the approved averaging techniques outlined in O. Reg 153/04 and to determine if the Table 1 Standards are potentially applicable or not. Based on the overall available pH data for the Site as noted above, it is currently assumed that, as a whole, pH will be confirmed within the acceptable range; therefore, the Table 1 Standards will not be applicable. The CSM and associated Phase Two report will be revised accordingly once the additional data is available, but currently assumes the Table 6 SCS is applicable.

The special conditions for land within 30 metres of a water body under Section 43.1 of O. Reg. 153/04 do not apply to the Phase Two Property; however, as bedrock has been encountered at less than 2 metres below ground surface (DCS, 2014), the special condition for shallow soil properties cited under Section 43.1 of O. Reg. 153/04 applies to the Phase Two Property.

The Phase Two Property, and adjacent properties within 100 m are serviced by a municipal water source. However, as the groundwater in the vicinity of the Property does and will serve as a raw water supply for a drinking water system, a potable groundwater condition was applied. Based on this information, the Table 6: Generic Site Condition Standards for Shallow Soils in a Potable Groundwater Condition for coarse-grained soil and residential/parkland/institutional property use (Table 6 SCS) was applied to the Site.

Imported Soil

Fill was found to be present across the Phase Two Property and extending from ground surface to a depth of approximately 0.1 to 3.1 mbgs (typically 316.3 to 313.4 masl). The fill materials were defined as coarse, and predominantly comprised of dark brown to black silty sands (like foundry sand) with black ash, brick, cinders, metal and wood debris. The depth of the fill materials ranged from 0.15 m at OW6 to 3.1 m at OW31 in the eastern portion of the Site. As discussed in the Phase One ESA (CH2M, 2017), two remedial excavations historically occurred at the Phase Two Property. An area in the northeast corner of

the Site (associated with the former galvanizing/plating building) was excavated to bedrock in 1999 and backfilled with granular 'B' material (Earth Tech, 1999) (Figure 6-1). The former capacitator room area in the south-central potion of the Site was also remediated for polychlorinated biphenyls (PCBs) as part of the Earth Tech (1999) demolition activities. Granular "B" material was used to backfill this excavation along with former pits and sumps across the Site.

Locations of Proposed Buildings and Structures

All buildings onsite have been razed; however, the majority of the concrete floors, foundations and footings of historical buildings remain in place. The approximate locations of the former buildings are show on Figure 2-2 (Attachment A1). Historically, approximately 23 buildings were present onsite.

The Site is proposed to be redeveloped for a combination of one or more of residential, parkland, commercial, and community land uses. The configuration of the buildings associated with the proposed redevelopment is not known at this time.

Contaminants Exceeding Applicable Site Condition Standards in Soil

Soil environmental conditions were characterized based on evaluation of historical samples, in addition to the recent investigations conducted for the Phase Two ESA. A total of 158 soil sampling locations and 307 soil samples were used to characterize the soil and identify COCs. Additional Phase Two activities are proposed at select locations at the Phase Two Property (Sampling and Analysis Plan provided in Attachment C), specifically for VOCs and pH. As previously stated, a finalized Phase Two CSM will be produced following the conclusion of this work and will be included in the RA submission. A summary of the soil analytical results is provided in this attachment as Table 6-5.

Soils on the Phase Two Property were found to be generally impacted with elevated soil concentrations of metals and petroleum hydrocarbons (PHCs). These types of activities are consistent with the historical, industrial nature of the Phase Two Property including:

- Former Foundry (APEC-1)
- Machine Shop (APEC-2, APEC-12)
- Annealing Room (APEC-3)
- Sand Storage (APEC-4, APEC-15)
- Plating and Galvanizing (APEC-5, APEC-11)
- Chipping and Grinding (APEC-6)
- Former USTs (APEC-8)
- Former Rail Line (APEC-13)
- Former Auto Repair and Garage (APEC-14, APEC-20)
- Coal Storage (APEC-21)
- Paint Shop (APEC-23)
- Drum Storage (APEC-25)
- Former Electrical Shop (APEC-27)
- Waste Oil Storage (APEC-28)
- Unknown Fill Quality (APEC-29)

Localized soil impacts from polycyclic aromatic hydrocarbons (PAHs), benzene, toluene, ethylbenzene, and xylenes (BTEX), volatile organic compounds (VOCs), and polychlorinated biphenyls (PCBs) were also identified in limited areas of the Phase Two Property. The presence of these parameters is consistent with the historical and industrial land use of the Site, including the use and storage of PCBs (APECs 16, 17, 22, 24, and 26).

The analytical results of the investigation are summarized in Table 6-5 along with a comparison to the Table 6 SCS (MECP, 2011). Figures 6-3 through 6-11 present the soil concentrations exceeding the Table

6 SCS by analytical group. Where there are exceedances of the Table 6 SCS, at least one cross-section presenting the inferred vertical extent of soil impacts by analytical group, has been prepared and follow the plan view figure. Maximum concentrations of each detected parameter have been provided in Table 6-6, and are shown in red text on the respective plan view and cross-sectional figures. COCs in soil have been identified in Table 6-7c.

The following subsections present a description of the soil conditions for each analytical group investigated.

Metals and Inorganics

Exceedances of the Table 6 SCS in soil for metals were widespread across the Site, with the majority of samples having detected exceedances for lead and zinc. These impacts are consistent with the historical use of the Site as a foundry (APEC-1), with associated machine shop uses (APECs 2 and 10), annealing uses (APEC-3), galvanizing uses (APECs 4 and 11), imported fill (APEC-29), and sand storage (APEC-4). Lead was detected at concentrations greater than the Table 6 SCS in 71 samples. Detected exceedances of lead greater than 5,000 µg/g were localized to the area surrounding BH07-65, near the western boundary of the site within APEC-26 (Former Substation). Zinc was detected in concentrations greater than the Table 6 SCS in 131 samples. Detected exceedances of zinc greater than 5,000 µg/g were found in 10 samples, with 6 of those at concentrations greater than 10,000 µg/g. These locations were localized to areas on the southeastern corner of the Site, all within APEC-5 (Galvanizing Building), with the exception of TP13-09 which is located 6 m west of the APEC boundary. The maximum zinc concentration of 67,200 µg/g occurred at MW17-108S. Overall, zinc was generally seen to increase in concentration with increasing depth, indicating that elevated zinc concentrations may also be attributable to naturally occurring zinc levels in the till or the bedrock below. Metals impacts were horizontally delineated by the Site's boundaries. Vertically, metals impacts were found in both the upper fill and deeper native silt overburden units, including at the contact with the shallow bedrock surface. The results of the soil investigation for metals are shown in plan view on Figure 6-3 (Part 1 and 2) and in cross-section view on Figures 6-3a through 6-3f.

Inorganic parameters, including cyanide, electrical conductivity (EC), and sodium adsorption ratio (SAR), were not detected at concentrations greater than the Table 6 SCS in the 93 samples analyzed from 67 locations. The results of the soil investigation for inorganics are shown in plan view on Figure 6-4.

Benzene, Toluene, Ethylbenzene, Xylenes (BTEX)

Concentrations of BTEX (specifically, benzene, ethylbenzene, and xylenes) in soil greater than the Table 6 SCS occurred in 3 samples from 2 locations of the 120 samples analyzed from 78 locations. Exceedances were localized to two areas of the Site. The first area, is along the western boundary within APECs for a former garage (APEC-20) and coal storage (APEC-21). Concentrations of benzene, ethylbenzene, and xylenes of 0.26, 4.1, and 3.9 µg/g, respectively were measured at BH07-66. Another exceedance occurred in the south-central area of the site within APECs for a former foundry (APEC-1) and unknown fill quality (APEC-29), with a concentration of benzene of 0.23 µg/g (duplicate sample concentration of 0.25 µg/g) at TP13-11. Neither of these locations had deeper samples collected due to the presence of shallow bedrock. The results of the soil investigation for BTEX are shown in plan view on Figure 6-5 and in cross-section view on Figures 6-5a and 6-5b.

Petroleum Hydrocarbons (PHCs)

PHC concentrations were found greater than the Table 6 SCS in 28 samples from 22 locations of the 122 samples analyzed from 85 locations. Exceedances of the Table 6 SCS for PHCs in soil were localized to three general areas. The west near the boundary of the Site including areas of APECs for former garage (APEC-20), extending north to include BH07-68, west towards APEC-25 and APEC-13 for drum storage and former rail lines, respectively, including MW18-117S, and south towards APEC-26 for a former substation to include TP18-312. The central southern area of the Site including areas of APECs for

former foundry (APEC-1), sand mixing and storage (APEC-15), oil house (APEC-7), transformers (APEC-16, APEC-22), PCB capacitors (APEC-17), former waste oil storage (APEC-28), and unknown fill quality (APEC-29). The eastern third of the Site including areas of APECs for a former machine shop (APEC-2, APEC-10), oil house (APEC-9), annealing room (APEC-3), galvanizing (APEC-5), and plating (APEC-11). No PHC F1 exceedances were identified. The maximum concentrations for F2 of 3,600 µg/g at BH07-46 and for F3 of 23,000 µg/g at BH07-40 are both located in the northwestern corner of the Site, within and downgradient of the area historically remediated (for metals and PHC impacts). The maximum concentration for F4 was 7,300 µg/g at BH07-67, within an APEC for a former garage (APEC-20). Five samples from four locations analyzed for PHCs exhibited concentrations greater than the MECP Free Phase Threshold values (MECP, 2011b) for F3 (BH07-40, BH07-41, BH07-67, and MW17-108S), and one sample had concentrations greater than the free phase threshold for F4 (BH07-67). Vertically, PHC impacts were found in both the upper fill and deeper native silt overburden units, including at the contact with the shallow bedrock surface. The results of the soil investigation for PHCs are shown in plan view on Figure 6-6 and in cross-section view on Figures 6-6a through 6-6e.

Polycyclic Aromatic Hydrocarbons (PAHs)

Concentrations of PAHs in soil greater than the Table 6 SCS occurred in 28 samples from 20 locations of the 112 samples analyzed from 80 locations. PAHs impacts (including all O. Reg. 153/04-regulated PAHs analytes) in soil were localized to three general areas. To the west, near the boundary of the Site, within APECs -20 and -21 for a former garage and coal storage, respectively, including BH07-68 just north of the APEC boundary. The south-central area of the Site including APECs for the former foundry (APEC-1), sand storage (APEC-4, APEC-15), coal storage (APEC-12), rail lines (APEC-13), former waste oil storage (APEC-28), and unknown fill quality (APEC-29). The eastern third of the Site including areas of APECs for coal storage (APEC-18, APEC-19), paint shop (APEC-23), former rail line (APEC-13), machine shop (APEC-2, APEC-10), and former UST (APEC-8).

The maximum concentrations of the majority of PAH analytes were located at OW07-34D, at a maximum depth of 1.22 mbgs, located within APECs for the former foundry (APEC-1) and for fill of unknown quality (APEC-29). Concentrations of PAHs at this location were consistently one or two orders of magnitude greater than other detected exceedances on the Phase Two Property. Borehole logs indicate that the material sampled at this location for PAHs was the upper fill materials. Deeper samples (that is, greater than 1.22 mbgs) collected just above the bedrock surface at nearby TP18-315 and MW17-102D also had concentrations of PAHs greater than the Table 6 SCS, however fewer analytes had exceedances and the reported concentrations were lower than at OW07-34D. Vertically, the PAHs impacts were primarily located in the fill, with decreasing concentrations in the deeper native silt overburden unit. The results of the soil investigation for PAHs are shown in plan view on Figure 6-7 and in cross-section view on Figures 6-7a through 6-7c.

Volatile Organic Compounds (VOCs)

Exceedances of VOCs occurred in 7 samples from 5 locations of the 100 samples analyzed from 67 locations. Trichloroethylene (TCE) was the only parameter detected at concentrations greater than the Table 6 SCS of 0.061 µg/g. Exceedances of the Table 6 SCS for VOCs were localized to two areas of the Phase Two Property: the eastern boundary including areas of APECs for a machine shop (APEC-10), and galvanizing (APEC-5), and towards the southwest corner of the Site including areas of APECs for a former foundry (APEC-1). The maximum TCE concentration of 1 µg/g was detected at OW13-39S,at a depth of 2.29 to 2.52 mbgs along the eastern property boundary. In this area, BH18-204 had a shallow soil sample (1.52-2.13 mbgs) that exceeded the SCS for TCE, and a deeper sample (3.04-3.65 mbgs) met the Table 6 SCS, however, there was no deeper sample collected at OW13-39S. MW17-102D in the southwest area of the Site had an exceedance at a depth of 0.15 to 0.3 mbgs, which is vertically delineated by a deeper sample collected from 1.83 to 2.13 mbgs that met Table 6 SCS. Additional horizontal and vertical delineation of the TCE impacts in soil in each impacted area are proposed (refer

to Attachment C). The results of the soil investigation for VOCs are shown in plan view on Figure 6-8 and in cross-section view on Figures 6-8a through 6-8c.

Chlorophenols (CPs)

CPs were not detected at concentrations greater than the Table 6 SCS in the 22 samples analyzed from 12 locations. CPs were potentially associated with the former foundry (APEC-1), sand storage and mixing (APEC-4; APEC-15), fill of unknown quality (APEC-29), offsite rail lines (APEC-30), and offsite steel valve manufacturing (APEC-31). As CPs did not have any detected concentrations at the Phase Two Property, they are not considered COCs for the Site. The results of the soil investigation for CPs are shown in plan view on Figure 6-9.

Polychlorinated Biphenyls (PCBs)

Concentrations of PCBs in soil greater than the Table 6 SCS occurred in 6 samples from 5 locations of the 72 samples analyzed from 53 locations. PCB exceedances were localized to three general areas: near the western boundary within APECs for a former garage (APEC-20) and unknown fill quality (APEC-29); to the east within APECs for a former machine shop (APEC-2, APEC-10) and unknown fill quality (APEC-29); and in the south-central area of the Site with APECs for former PCB capacitors (APEC-17) and unknown fill quality (APEC-29). The maximum PCB concentration of 1.65 µg/g occurred in the western area at the surface in TP17-300. An adjacent location, BH07-67 had a sample from 0.05 to 0.91 mbgs with a concentration of 1.5 µg/g for total PCBs. The maximum concentration at TP17-300 was vertically delineated by a deeper sample from 0.3 to 0.61 mbgs that meets the Table 6 SCS. The exceedance at BH07-67 was delineated by a deeper sample at 1.22 to 1.37 mbgs with concentrations of PCBs less than the SCS. Other areas of PCB contamination at SS-41 and TP17-306 in the south-central portion of the Site did not have deeper samples as they were collected right above the bedrock. Shallow PCB impacts at TP13-08 in the eastern area were vertically delineated by deeper samples collected from TP18-316 and BH07-52. The results of the soil investigation for PCBs are shown in plan view on Figure 6-10 and in cross-section view on Figures 6-10a and 6-10b.

Acid, Base, and Neutral Compounds (ABNs)

ABNs were not detected at concentrations greater than the Table 6 SCS in the 73 sampes analyzed from 52 locations. ABNs were potentially associated with the former foundry (APEC-1), sand storage and mixing (APEC-4; APEC-15), fill of unknown quality (APEC-29), offsite rail lines (APEC-30), and offsite steel valve manufacturing (APEC-31). As ABNs did not have any detected concentrations at the Phase Two Property, they are not considered COCs for the Site. The results of the soil investigation for ABNs are shown in plan view on Figure 6-11.

Contaminants Exceeding Applicable Site Condition Standards in Groundwater

Groundwater across the Phase Two Property was evaluated via 93 groundwater monitoring wells screened in the overburden and bedrock contact zone, the Eramosa Formation, or the Goat Island Formation. Additional Phase Two groundwater sampling activities are proposed at select existing monitoring wells (Attachment C). As previously stated, a finalized Phase Two CSM will be produced following the conclusion of this work and will be included in the RA submission. A summary table of groundwater analytical results is provided in this attachment as Table 6-8.

Three hundred and thirty-one groundwater samples were collected from 93 locations across the Phase Two Property. Groundwater was generally found to be impacted with chlorinated VOCs (specifically, chloroethenes), with localized impacts of chloroethanes, BTEX, metals, PAHs, and PHCs.

The analytical results of the investigation are summarized on Table 6-8 along with a comparison to the Table 6 SCS (MECP, 2011). Figures 6-12 through 6-20 present the groundwater concentrations exceeding the Table 6 SCS by analytical group. Where there are exceedances of the Table 6 SCS, at least one cross-

section presenting the inferred vertical extent of groundwater impacts by analytical group, has been prepared and follow the plan view figure. Maximum concentrations of each detected parameter have been provided in Table 6-9 and shown in red text on the respective plan view and cross-sectional figures. COCs in groundwater are identified in Table 6-10c.

Metals and Inorganics

Concentrations of metals in groundwater greater than the Table 6 SCS were observed in 71 samples from 22 locations of the 248 samples analyzed from 72 locations. Exceedances were primarily for arsenic, lead, and zinc. Isolated exceedances of antimony, cobalt, and uranium occurred in single sampling events, but the results were not reproduced in subsequent sampling events. Therefore, these analytes were not considered groundwater COCs. The distribution of metals impacts in groundwater is smaller in area than the distribution of impacts in soil, but the impacts generally correspond geographically and are consistent with the wide-spread historical use of the Site as a foundry (APEC-1).

Arsenic exceedances in groundwater were localized to the north-central area of the Site within APECs for drum storage (APEC-25), unknown fill quality (APEC-29), and offsite PCAs (APEC-30). Two exceedances of the Table 6 SCS for arsenic occurred in the upper overburden and bedrock contact zone (MW17-112S, OW07-31) and one exceedance occurred in the Eramosa Formation (Reformatory Quarry) unit (MW18-112D). Arsenic impacts were vertically delineated by MW18-112G, which was installed deeper than MW18-112D within the Eramosa Formation (Vinemount).

Lead exceedances were localized to one location (OW09-II) in the northeast portion of the Site, including APECs for coal storage (APEC-19), unknown fill quality (APEC-29), and offsite PCAs to the south (APEC-31). OW09-II is screened within the Eramosa Formation (Reformatory Quarry) unit and the lead impacts were vertically delineated by MW18-129D, which was installed deeper within the same unit.

Zinc exceedances were localized to the eastern third of the Site and the central portion of the Site (OW07-32, OW07-37). APECs in these locations include a former machine shop (APEC-10), plating (APEC-11), sand mixing and storage (APEC-15), unknown fill quality (APEC-29), and offsite PCAs (APEC-31). Impacts of zinc were generally limited to the upper overburden and bedrock contact zone (fifty-three samples from 13 locations had exceedances of the Table 6 SCS for zinc). Only three samples from one location (OW18-II) had exceedances within the Eramosa Formation (Reformatory Quarry) unit. In the central portion of the Site, MW18-116D provides vertical delineation of the shallow groundwater impacts. In the eastern portion of the Site, several wells provide vertical delineation for the shallow groundwater impacts, including MW18-130D, MW18-132D, OW13-39D, OW22D, MW18-133D, MW18-129D, and OW31.

The results of the groundwater investigation for metals are shown in plan view on Figure 6-12 and in cross-section view on Figures 6-12a through 6-12d.

Inorganic parameters, including chloride, cyanide, sodium were not detected at concentrations greater than the Table 6 SCS in the 225 samples analyzed from 65 locations. The results of the groundwater investigation for inorganics are shown in plan view on Figure 6-13.

BTEX

Concentrations of BTEX (specifically, benzene and ethylbenzene) in groundwater greater than the Table 6 SCS occurred in 56 samples from 17 locations of the 271 samples analyzed from 87 locations. Exceedances were found to be localized to two areas of the Site: the eastern third and the south-central area along the southern boundary of the Phase Two Property. These areas had APECs related to a former foundry (APEC-1) and unknown fill quality (APEC-29) in the south-central area, and former machine shops (APEC-2, APEC-10), annealing room (APEC-3), former UST (APEC-8), oil house (APEC-9), plating (APEC-11), and offsite PCAs to the east (APEC-31) for the eastern third of the Site. The distribution of BTEX impacts in groundwater is larger in area than the distribution of impacts in soil and

generally do not overlap. This pattern may indicate migration away from historical remediated soil sources (for example, in the northeast corner of the Site) with groundwater flow, the presence of offsite sources, or both.

Maximum detected concentrations for benzene and ethylbenzene both occurred at MW17-105S, in the upper overburden and bedrock contact unit in the eastern portion of the Site. MW17-105D, nested with MW17-105S but screened within the Eramosa Formation (Reformatory Quarry/ Vinemount) unit also had exceedances of the Table 6 SCS for benzene, but had non-detected results for ethylbenzene. The benzene concentrations were an order-of-magnitude lower in the deeper unit compared the upper unit. Monitoring well (MW18-105G) was installed deeper than MW17-105D for vertical delineation, with non-detected concentrations of BTEX reported. The BTEX impacts in the eastern area were vertically delineated by several monitoring wells including MW18-105G, MW18-128D, MW18-133D, and OW31. The results of the groundwater investigation for BTEX are shown in plan view on Figure 6-14 and in cross-section view on Figures 6-14a through 6-14d.

PHCs

Concentrations of PHCs (PHC F1 to F4) in groundwater were greater than the Table 6 SCS in 26 samples from 8 locations of the 207 samples analyzed from 61 locations. PHC impacts in groundwater are localized to two areas of the Phase Two Property: the eastern third of the Site with APECs for a former annealing room (APEC-3), machine shop (APEC-10), unknown fill quality (APEC-29), and offsite PCAs to the east (APEC-31), and the south-central area of the Site with APECs for a former foundry (APEC-1), PCB capacitors (APEC-17), and unknown fill quality (APEC-29). The locations of PHC impacts in groundwater are geographically similar to two of the three areas where PHCs in soil were identified. This pattern suggests that the groundwater impacts are a result of onsite soil sources, with some dispersion away from soil sources via groundwater flow. Maximum concentrations of F2, F3, and F4 occurred at OW22S, located near the northeastern corner of the Phase Two Property within the footprint of the area historically remediated (for metals and PHC impacts). The maximum concentration of PHC F1 occurred at OW24D, located in the southeast corner of the Site. PHC impacts in groundwater in the eastern portion of the Site were vertically delineated by several monitoring wells including OW22D, OW13-39D, MW17-104D, MW18-128D, MW18-135D, and OW31. Light nonaqueous phase product (LNAPL) has been measured within OW23S, MW17-108S, and MW18-135S (all screened within the overburden and bedrock contact zone aquifer unit) on various occasions. The shallow PHC impacts in the south-central portion of the Site at OW25 were vertically delineated by MW18-126D. The results of the groundwater investigation for PHCs are shown in plan view on Figure 6-15 and in cross-section view on Figures 6-15a through 6-15e.

PAHs

Concentrations of PAHs in groundwater were greater than the Table 6 SCS in 24 samples from 8 locations of the 189 samples from 54 locations. Exceedances of PAHs in groundwater were generally localized to three areas of the Property: the eastern third with APECs for former annealing room (APEC-3), plating (APEC-11), machine shop (APEC-10), unknown fill quality (APEC-29), and offsite PCAs to the north (APEC-30); the centre with APECs for sand storage (APEC-4), and unknown fill quality (APEC-29); and the south-central area with APECs for former foundry (APEC-1), and unknown fill quality (APEC-29). The distribution of PAHs impacts in groundwater is comparable in area to the distribution of impacts in soil, but the impacts do not overlap in all cases. The historical remedial activities in the northeast corner of the Site (for metals and PHCs) may have removed a soil source of PAHs, as PAHs are absent in soil in this area, but the largest region of PAHs impacts in groundwater are located within and adjacent to the excavation footprint.

The majority of detected exceedances and maximum concentrations for PAHs occurred at OW22S and OW23S, both screened in the upper overburden and bedrock contact. Both of these locations have nested deeper wells installed in the Eramosa Formation (Reformatory Quarry) unit that have samples

meeting the SCS for the parameters that exceeded in the shallow aquifer unit (OW22D for OW22S and OW23D for OW23S). Additional vertical delineation in the eastern portion of the Site is provided by OW13-39D and MW18-135D. The PAHs impacts located in the centre and south-central areas of Site, have either been vertically delineated (OW03-I by OW03-II), or have had subsequent samples meeting the Table 6 SCS (OW25). The results of the groundwater investigation for PAHs are shown in plan view on Figure 6-16 and in cross-section view on Figures 6-16a through 6-16d.

Volatile Organic Compounds (VOCs)

VOCs were found at concentrations greater than the Table 6 SCS in 155 samples from 52 wells of the 259 samples analyzed from 87 locations across the Phase Two Property. VOC impacts were present across the entire Site. The distribution of VOC impacts in groundwater is larger in area than the distribution of VOC impacts in soil, indicating migration away from soil sources with groundwater flow. Soil VOC concentrations suggestive of on-site chlorinated VOC source areas were not identified. Chlorinated VOC impacted groundwater may originate or be amplified by the presence of offsite sources (for example, offsite manufacturing activities [APEC-31, APEC-32, APEC-33]). While onsite APECs associated with historical VOC use have been identified, for example, the operation of a foundry (APEC-1), machine/electrical shops (APEC-2, APEC-10, APEC-27), galvanizing activities (APEC-5, APEC-11), most of the VOC impacts in groundwater in the Eramosa Formation or deeper are believed to originate from offsite sources. The following subsections discuss the distribution of chloroethenes (specifically, 1,1-dichloroethene; cis-1,2-dichloroethene [cis-1,2-DCE]; tetrachloroethene; trans-1,2-dichloroethene; trichloroethylene [TCE]; and vinyl chloride) and chloroethanes (1,1,1-trichloroethane and 1,1-dichloroethane) in groundwater. The results of the groundwater investigation for VOCs are shown in plan view on Figure 6-17 (Part 1 and 2) and in cross-section view on Figures 6-17a through 6-3e.

Chloroethenes

Chloroethenes in groundwater were found at various depths throughout the Site. Of the 50 wells screened in the upper overburden and bedrock contact zone and sampled for chloroethenes, 21 had concentrations greater than the Table 6 SCS. These shallower impacts are generally located in the southwestern portion and eastern corner of the Site. Of the 36 wells screened in the Eramosa Formation (Reformatory Quarry/ Vinemount) unit and sampled for chloroethenes, 28 had concentrations greater than the Table 6 SCS. These deeper impacts are widespread across the Site, including the northwestern portion of the site where shallow groundwater impacts were not observed. The only well screened in the Goat Island Formation (OW31) had low-level detections of cis-1,2-dichloroethene (1.88 µg/L to 2.01 µg/L compared to a SCS of 1.6 µg/L), with all other chloroethenes reported as nondetect. The maximum concentrations of the majority of the chloroethenes were found in OW24D, which is located in the extreme southeastern corner of the property, adjacent to an area of known increasing groundwater concentrations off Site, therefore implying a source area off Site in an easterly direction. Vertical delineation of impacts has been achieved for 1,1-dichloroethene and trans-1,2-dichloroethene (MW18-128D and OW31), TCE (MW17-103D, OW07-34D, MW18-123D, and OW31), and vinyl chloride (MW18-128D, MW18-133D, MW18-136D, MW18-105G, and OW31). Concentrations of these COCs are generally highest adjacent to the eastern property boundary (near OW13-39S/D and OW24D) and decrease with both depth and distance from this area. Vertical delineation was not achieved for cis-1,2-dichloroethene, as uniform concentrations were encountered in almost every monitoring well installed with screens between 10.28 and 25.32 mbgs. cis-1,2-Dichloroethene concentrations in 15 monitoring wells in this zone ranged from 1.23 to 5.36 µg/L (average of 2.4 µg/L), which is similar to the concentrations measured in OW31, screened from 28.9 to 33.32 mbgs in the Goat Island Formation. Further efforts to vertically delineate cis-1,2-DCE, deeper into the Goat Island formation were not considered warranted as:

- The concentration of cis-1,2-DCE in the deepest hydrostratigraphic unit, the Goat Island Formation, does not appear to be the result of chlorinated VOC impacts derived from the upper

hydrostratigraphic unit. That is, where maximum chlorinated VOC parent compounds were identified, elevated concentrations of cis-1,2-DCE were not observed. This is evident in the area near OW31 where elevated concentrations of TCE were identified in the Stone Road and Reformatory Quarry Members of the Eramosa Formation. At this location TCE was not identified in the lower Goat Island Formation in OW31; however, approximately 2 µg/L of cis-1,2-DCE was identified;

- The concentration of cis-1,2-DCE at OW31 could be the result of downward migration in that area, however as previously noted, cis-1,2-DCE was identified from 1.23 to 5.36 µg/L in the lower hydrostratigraphic units (Vinemount Member and Goat Island Formation), across the area of the Site, including areas that are hydraulically up and cross-gradient of the shallow groundwater flow paths where elevated chlorinated VOCs in higher hydrostratigraphic units are observed. The concentration of cis-1,2-DCE at OW31 ranged from 1.88 to 2.01 µg/L (in the Goat Island Formation) was consistent with the concentration of cis-1,2-DCE, noted in other wells screened across the Goat Island and Vinemount Member across the site where concentrations ranged from 1.23 to 5.36 µg/L;
- The consistent concentration of cis-1,2-DCE identified in the Goat Island Formation and the Vinemount Member, a regional aquitard, implies that impact to the Goat Island Formation may be widespread, and is interpreted to be sourced from an area upgradient of the Site.
- It is also noted that the Site lies within the two-year Wellhead Protection Area (WHPA-B) for several of the City of Guelph's municipal water supply wells. Phase Two activities included characterization of the COCs to a depth of approximately 25 to 30 mbgs, but characterization did not extend into the underlying municipal production aquifer (Gasport Formation) that is estimated to lie approximately 40 to 50 mbgs. As previously discussed within the Hydrogeological Characteristics section, the Goat Island and Gasport Formation are understood to be hydraulically connected to one another, with the Gasport Formation serving as the principal municipal aquifer. Water quality data in the City's Membro, Park and Emma Wells were observed to have low concentrations of TCE and cis 1,2-DCE in 2017 (City of Guelph, 2018). The average detected concentrations of cis-1,2 DCE in the City's water supply in 2017 was 1.8 µg/L (0.00178 mg/L), similar to the observed concentrations on Site (City of Guelph, 2018).

These factors suggest there is a broad area of low concentration cis-1,2-DCE just greater than the Table 6 SCS beneath the Vinemount Member of the Eramosa Formation, a regional aquitard, including on Site. The data does not support the conclusion that chlorinated VOC impacts identified on Site are materially contributing to the observed elevated concentrations of cis-1,2-DCE.

Chloroethanes

Chlorethanes were found at concentrations greater than the Table 6 SCS in 9 samples from 8 locations. These impacts appear to be localized to the southwestern area of the Phase Two Property, with APECs for a former foundry (APEC-1), oil house (APEC-7), electrical shop (APEC-27), waste oil storage (APEC-28), unknown fill quality (APEC-29), and offsite PCAs to the south and west (APEC-32, APEC-33). The chloroethane impacts are primarily located in the upper overburden and bedrock contact zone in this area, with deeper impacts only observed in two monitoring wells within the Eramosa Formation (Reformatory Quarry) unit. Vertical delineation of chloroethane impacts are provided by the following monitoring wells which have concentrations of chloroethanes less than the Table 6 SCS: MW18-122G, MW18-120D, MW18-119D, MW18-116D, MW18-123D, MW18-126D, MW17-102D, and OW26D.

CPs

CPs were not detected at concentrations greater than the Table 6 SCS in the 11 samples analyzed from 9 locations. All RLs met the Table 6 SCS. As CPs did not have any detected concentrations at the Phase Two Property, they are not considered COCs for the Site. The results of the groundwater investigation for CPs are shown in plan view on Figure 6-18.

PCBs

PCBs were analyzed in 25 groundwater samples from 17 locations with concentrations reported greater than the Table 6 SCS at one location, OW26S, in 2010. Subsequent sampling events in 2011 and 2017 at this location reported nondetect concentrations and RLs below the SCS of 0.20 µg/L. All other samples for PCBs in groundwater on the Phase Two Property were nondetect with RLs which met the Table 6 SCS. APECs associated with PCBs include transformer use (APEC-16 and APEC-22), a garage (APEC-20), former capacitor room (APEC-17), former substation (APEC-29), PCB storage area (APEC-24), and fill of unknown quality (APEC-29). Remediation for PCBs occurred for the former capacitor room (APEC-17) where concentrations of PCBs in soil less than 5 µg/g were left in place. These residual soil impacts do not appear to be having an impact on groundwater, based on nondetect results of PCBs in the monitoring wells immediately downgradient of this APEC. The results of the groundwater investigation for PCBs are shown in plan view on Figure 6-19.

ABNs

ABNs were analyzed in 52 samples from 27 locations and were not detected in concentrations greater than the Table 6 SCS; however, one sample at OW23S had a raised RL for 1,1'-biphenyl that was greater than the Table 6 SCS. As all other samples on the Phase Two Property did not have detected concentrations of this parameter, and the laboratory noted dilution was required due to concentrations of other parameters, namely PAHs and PHCs in the sample, 1,1'-biphenyl is not considered a COC for the Phase Two Property. The results of the groundwater investigation for PCBs are shown in plan view on Figure 6-20.

Climatic or Meteorological Conditions Affecting Contaminant Distribution

Climatic or meteorological conditions that may have influenced the distribution and migration of COCs at the Phase Two Property include temporal fluctuations in groundwater levels. No atypical weather events that would be expected to influence COC transport are known to have occurred during the investigation of the Phase Two Property.

Soil Vapour Intrusion

Vapour intrusion was not evaluated as part of the Phase Two ESA because there are currently no existing buildings on the Phase Two Property. Details regarding the location or construction details of future buildings, or where subsurface utilities will be installed are not known at this time. Based on the results of the Phase Two ESA, volatile COCs are present in soil and groundwater at concentrations greater than the Table 6 SCS. Therefore, an assessment of the potential for vapour intrusion into future buildings should be further investigated as part of a Risk Assessment for the Phase Two Property or when detailed redevelopment plans become available.

Contaminant Pathways and Receptors

Figures E-1 and E-3 (Attachment E) present the human health and ecological contaminant pathway and receptor models, respectively, based on current and potential future Site conditions. The Site could be redeveloped for a mix of one or more of residential, commercial, parkland or community land use in the future. The models present preliminary assessments of the exposure pathways that should be further investigated, should a Risk Assessment be conducted for the Phase Two Property.

These figures identify the following:

1. **Release mechanisms** – The Phase Two Property became impacted as a result of historical operations at the Site (refer to the discussion on PCAs and APECs) where COCs were released to the ground (for example, via a spill or leak) or where impacted soil was imported to the Site and placed as fill.

2. **Contaminant transport pathways** – COCs released to soil may adsorb to soil or infiltrate deeper into the soil column. COCs in soil may also desorb and leach to groundwater or migrate vertically to the water table. COCs in soil can also be transported in the following ways: they can become airborne via wind or traffic erosion, eroded by overland water flow, be taken up by vegetation planted in the soil, or volatilize to outdoor air or indoor enclosed spaces. COCs in groundwater can be transported via vertical or horizontal groundwater flow, volatilization to outdoor air or indoor enclosed spaces, and uptake by vegetation.
3. **Human and ecological receptors located on, in, or under the Phase Two Property** – Receptors currently present or expected to be present in the future at the Phase Two Property include:
   - Human Receptors – residents, visitors, indoor workers, outdoor workers, construction workers, and utility workers.
   - Ecological Receptors - soil organisms, terrestrial plants, birds, and mammals
4. **Receptor exposure points** – COCs can be contacted directly in soil or groundwater and indirectly in outdoor and indoor air.
5. **Routes of exposure** – The primary routes of exposure by receptor type include:
   - Human Receptors
     - Direct contact with either soil or groundwater (incidental ingestion and dermal contact)
     - Inhalation of particulates (dust)
     - Inhalation of volatiles originating from a soil or groundwater source (indoor and outdoor air)
     - Ingestion of garden produce
   - Ecological Receptors
     - Direct contact with either soil or groundwater (ingestion and dermal)
     - Terrestrial plant root uptake from either soil or groundwater
     - Ingestion via terrestrial biota and prey

Proposed Future Land Use

The proposed land uses of the Phase Two Property includes residential and parkland uses. The proposed locations of any proposed buildings were unknown at the time this report was written.

Table 6-4. APEC Disposition Table
200 Beverley Street, Guelph, Ontario

Areas of Potential Environmental Concern (APEC)		PCA [a.]		COCs (based on AP method groups [b,c])	Location Associated with APEC Area	Location Type	List of Parameter Groups tested (soil) [b.]	List of Parameter Groups Tested (GW) [b.]	List of Parameters above Table 6 (soil) [d.]	List of Parameters above Table 6 (GW) [d.]	Comments
APEC-1	Foundry - A foundry was operated on the site by IMICO from 1913 to 1989 when the plant closed and was abandoned. The foundry operated as an iron-jobbing facility for the production of various metallic forms using malleable and ductile iron (DCS, 2014). Foundry sands were predominantly located in the concrete pits and sumps of the main Foundry building. Foundry sands, sludge materials, and process waste were removed from the site and buildings were demolished in 1999 (Earth Tech, 1999). The P&R investigation also reported that moulding sands and dust collector waste was stored at the north west corner of the building and drained to the truck bay (P&R, 1991).	32	Iron and Steel Manufacturing and Processing	VOCs, PHCs, PAHs, ABNs, CPs, Metals	7	TP	ABNs, Metals**, PAHs, CN-, CrVI, EC, Hg, pH	-	None	-	Current or historical sampling activities, or both, have captured the COCs in soil and groundwater. APEC-2	Machine Shop - A machine shop was shown on the 1916 FIP, east of the original foundry. The northern one-third of the Machine Shop was identified for 'Tumbling and Cleaning' operations, inferred to be in association with the adjacent 'Annealing Room' to the north. FIPs prepared in 1929, 1945 and 1960 showed this area changed operations to 'Shipping' and a 'Pattern Shop'.	34	Metal Fabrication	VOCs, PHCs, PAHs, metals	BH07-47	BH	Metals**, PAHs, PCBs, VOCs	-	Metals (Cd, Pb, Zn)	-	Current or historical sampling activities, or both, have captured the COCs in soil and groundwater. APEC-3	Annealing - An 'Annealing Room' with four furnaces is shown on the 1916 FIP. A brick chimney is located on the north wall. The 1929 FIP shows nine furnaces with the Annealing Room extended westward with an additional chimney on the north wall within the extended area; the southern portion of the Annealing Room is identified as the 'Tumbling Dep't'. The 1946 FIP shows a structural addition on the east side of the Annealing Room, with two additional furnaces. The 1960 FIP shows further eastward expansion and the addition of a third furnace. Tumbling Dep't operations appear consistent in location and footprint, from 1929 through to 1960. The furnaces are inferred to be coal fired from 1916 through to 1960, based on the nearby coal storage areas shown on the 1946 and 1960 FIPs, and the absence of ASTs or USTs for fuel oil storage on any of the FIPs. The furnace fuel from after 1960 to the end of operations in 1989 is not known, but a period of fuel oil fired operation of the furnaces is suspected; see APEC 7. No information was identified to suggest coal or fuel oil storage within the Annealing Room; however, no information regarding temporary furnace fuel storage, transmission or waste disposal was identified. Dust control equipment is shown on Figure 4 of the 1991 P&R report, on the north side of the Annealing Room.	32	Iron and Steel Manufacturing and Processing	VOCs, PHCs, PAHs, metals	BH07-46	BH	Metals**, PAHs, PCBs, VOCs	-	Metals (Cd, Pb, Zn)	-	Current or historical sampling activities, or both, have captured the COCs in soil and groundwater. APEC-4	Sand Storage - The 1916 FIP shows a 'Sand Shed'. The 1929 and 1946 FIPs again show the Sand Shed, plus a second smaller building to the west labelled 'Sand'. The 1960 FIP shows the original 'Sand Shed' as 'Bricks' and the second smaller building to the west labelled as 'Sand & Bricks', and an additional area to the north labeled 'Sand'. No information was identified to if only clean process, spent foundry sands or both were stored in these buildings, therefore the potential storage of spent foundry sand in these buildings is considered. The purpose and types of bricks stored was not identified. The potential for new and used refractory brick and associated process materials is considered possible.	32	Iron and Steel Manufacturing and Processing	PAHs, ABNs, CPs, metals	BH07-58	BH	Metals**, PAHs, PCBs, VOCs	-	None	-	Current or historical sampling activities, or both, have captured the COCs in soil and groundwater. Table 6 Standards exceedances in soils included metals, and PAHs. Table 6 Standards exceedances in groundwater included PAHs. Sampling has captured the COCs, and the APEC has been addressed.

200 Beverley Street, Guelph, Ontario

Areas of Potential Environmental Concern (APEC)		PCA [a.]		COCs (based on AP method groups [b,c])	Location Associated with APEC Area	Location Type	List of Parameter Groups tested (soil) [b.]	List of Parameter Groups Tested (GW) [b.]	List of Parameters above Table 6 (soil) [d.]	List of Parameters above Table 6 (GW) [d.]	Comments
APEC-5	Galvanizing Building - A small free standing building for 'Galvanizing' was present on the south east portion of the Site as shown on the 1916, 1929 and 1946 FIPs. The Galvanizing building was not shown on the 1960 FIP, with the area occupied by a larger new structure identified as 'Fittings Whse' (warehouse). No information was identified regarding process chemical use and storage, or waste management practices, in association with the galvanizing operations conducted.	33	Metal Treatment, Coating, Plating and Finishing	VOCs, PHCs, PAHs, metals	BH18-207	BH	Metals, Chemistry, PHC, pH	-	Metals (Cd, Pb, Zn)	None	Current or historical sampling activities, or both, have captured the COCs in soil and groundwater. Table 6 Standards exceedances in soils included metals, and PHCs. No Table 6 Standards exceedances in groundwater were identified. Sampling has captured the COCs, and the APEC has been addressed.
					MW17-108S	MW	Metals, ABN, BTEX, CP, Chemistry, PAH, PHC, VOC, EC, pH, SAR, B-HWS, CrVI, Hg	Metals, BTEX, Chemistry, PAH, PHC, VOC, Cl, CrVI, CN-, Hg, EC, pH	Metals (Cd, Cu, Pb, Zn) PHCs (F2, F3)	None

					TP18-310	TP	Metals, Chemistry, PHC, pH	-	Metals (Cd, Pb, Zn)	-	
APEC-6	Chipping/Grinding Room - A 'Chipping Room' was shown on the FIPs prepared in 1929, 1946 and 1960, located west of the Annealing area. The 1916 FIP shows this as exterior yard area west of the 'Annealing Rm', with a small outbuilding that appears to be connected to the Annealing Room with a linear underground feature. The 1991 P&R report identified this as a 'Trimming and Grinding' area; this information inferred to be based on the interview of historical IMICO employees. 'Dust control equipment' is shown on Figure 4 of the 1991 P&R report, on the exterior west side of the building.	34	Metal Fabrication	Metals	BH18-208	BH	Metals, Chemistry, PAH, pH	-	Metals (Cd, Pb, Zn)	None	Current or historical sampling activities, or both, have captured the COCs in soil and groundwater. Table 6 Standards exceedances in soils included metals. No Table 6 Standards exceedances in groundwater were identified. Sampling has captured the COCs, and the APEC has been addressed.
					MW17-100S	MW	Metals, BTEX, Chemistry, PHC, VOC, EC, pH, SAR, B-HWS, CrVI, Hg	Metals, BTEX, Chemistry, PAH, PHC, VOC, Cl, CrVI, CN-, Hg, EC, pH	Metals (V, Zn)	None	
APEC-7	Oil Houses, Boiler House and ASTs - A building is shown on the 1929 FIP to the north of the Foundry and east of the power house with a label "Oil", and an additional building with the same label is shown to the north of this original building on the 1946 FIP. The 1960 FIP shows the north building remaining, but is not labeled as an oil house. The 1916 FIP shows this as empty exterior yard area north of the foundry. The P&R Investigation figures show a boiler house to the east of the power house, and two 45,000-L (10,000 gallon) oil tanks to the east of the building with "no history of leaks or spills" (P&R, 1991). One 45,000-L AST was reported removed in 1998 during demolition activities and had been used to store Bunker C fuel. The AST removed had been located east of the Core Room (Earth Tech, 1999).	28	Gasoline and Associated Products Storage in Fixed Tanks	BTEX, PHCs	BH07-56	BH	Metals**, PAHs, PCBs, VOCs	-	Metals (Sb, Cd, Cu, Pb, Zn), PAHs (B(a)P, FLT)	-	Current or historical sampling activities, or both, have captured the COCs in soil and groundwater. Table 6 Standards exceedances in soils included metals and PAHs. Table 6 Standards exceednaces in groundwater included metals and VOCs. Sampling has captured the COCs, and the APEC has been addressed.
					JS15	TP	ABNs, Metals**, PAHs, PCBs, CN-, CrVI, Hg	-	None	-	
					MW17-103D	MW	Metals, ABN, BTEX, CP, Chemistry, PAH, PHC, VOC, EC, pH, SAR, B-HWS, CrVI, Hg	BTEX, VOC	Metals (Cd, Zn) PAHs (B(a)A, B(a)P, B(b)F, DB(ah)A, I(123-cd)P)	None

					TP13-04	TP	Metals, PAHs, PCBs, PHCs, VOCs, Hg	-	None	-	
APEC-8	Gasoline UST - As indicated on the 1960 FIP, a gasoline UST is shown north of a small office building, and west of 'scales' at the corner of Kingsmill Avenue and Beverley Street. The area is empty exterior yard area on the 1916 FIP, and the 1929 and 1946 FIPs show the office (labeled as a 'time office'), but does not show the UST. The gasoline use is not known, however it is inferred to be for fueling gasoline-powered equipment/vehicles used at the plant. The 1991 Proctor & Redfern investigation reported that an IMICO employee indicated the UST was removed in the mid-1980s in response to a request from the City due to gasoline vapours in the sewers along Beverley and York Streets. No significant contamination was reported (P&R, 1991).	28	Gasoline and Associated Products Storage in Fixed Tanks	VOC, PHCs, PAHs, metals	B	TP	Metals**, CrVI, EC, pH	-	Metals (Pb, Zn)	-	Current or historical sampling activities, or both, have captured the COCs in soil and groundwater. Table 6 Standards exceedances in soils included metals and PAHs. Table 6 Standards exceednaces in groundwater included BTEX and VOCs. Sampling has captured the COCs, and the APEC has been addressed.

APEC-10	Machine Shop - A machine shop is shown on the 1929, 1946 and 1960 FIP, east of the original foundry building. The floor is indicated as concrete. Machine shop cuttings were stored on the ground north of the building, and two small ceiling mounted oil tanks were present in the building as noted in the P&R investigation (1991). The area is shown on the 1916 FIP as exterior yard area, with a small unidentified building in the central area of the future machine shop.	34	Metal Fabrication	VOCs, PHCs, PAHs, metals	BH07-40	BH	Metals**, PAHs, PCBs, VOCs, CN-, CrVI, EC, Hg, pH, SAR	-	Metals (Cd, Pb, Zn)	-	Current or historical sampling activities, or both, have captured the COCs in soil and groundwater. Table 6-4. APEC Disposition Table
200 Beverley Street, Guelph, Ontario

Areas of Potential Environmental Concern (APEC)		PCA [a.]		COCs (based on AP method groups [b,c])	Location Associated with APEC Area	Location Type	List of Parameter Groups tested (soil) [b.]	List of Parameter Groups Tested (GW) [b.]	List of Parameters above Table 6 (soil) [d.]	List of Parameters above Table 6 (GW) [d.]	Comments
APEC-11	Plating/Galvanizing Building - A galvanizing building was present on the Site as shown on the 1946 and 1960 FIP. The previous FIPs (1916 and 1929) show this as exterior yard area. On subsequent site plans (P&R, 1991; Earth Tech 1999), the building was identified as a storage shed and reported as having been used for dip galvanizing before 1975, with rinse water discharged into "dry wells" north of the building (P&R, 1991). Investigations by P&R and Gartner Lee indicated high concentrations of zinc, other metals, and oil & grease. Free product was observed wells (OW01-I, OW20, OW21). The area was excavated to bedrock (ranging from 1.3 to 2.0 mbgs and approximately 9,400 tonnes of contaminated soil and 925 tonnes of contaminated concrete were removed. Soil samples were collected from the final limits of the excavation walls and indicated most locations having zinc and TPH concentrations above the Table A Guidelines. The excavation was backfilled with granular "B" materials. A single sample was collected from the backfill and met the guidelines applicable at the time of the report (Earth Tech, 1999). A well nest (OW22S/D) was installed within the excavation area (the report for this installation was not available and therefore the soil conditions are unknown if analyzed as part of the investigation). Testpits and boreholes installed in the area in 2013 by DCS indicated soils having high zinc and other metal concentrations. Groundwater conditions at OW22S reported free product which was highly weathered with a slight oil/diesel odour (as reported in the summary of the Gartner Lee 2000/2001 investigation in DCS, 2007a). Borehole logs for OW22S/D indicate the presence of fuel/diesel type odour in the fill which extends to approximately 1.5 mbgs; and hydrocarbon odour extending into the underlying bedrock with black staining on fractures. Groundwater sampled from OW22S has not since reported free product, but has had concentrations of PHCs increasing since the annual monitoring at this location began in 2016, up to 850,000 ug/L of F3. Zinc concentrations have widely fluctuated over the years and have exceeded in approximately 25% of the sampling events between 2005 and 2016.	33	Metal Treatment, Coating, Plating and Finishing	VOCs, PHCs, PAHs, metals	BH07-42	BH	Metals**, PCBs, VOCs, CN-, CrVI, EC, Hg, pH, SAR	-	Metals (Cd, Pb, Zn)	-	Current or historical sampling activities, or both, have captured the COCs in soil and groundwater. APEC-16	Transformers - Transformers are first shown on the 1960 FIP, north of the powerhouse. Previous FIPS (1916, 1929, 1946) show this as exterior yard area north of the power house. Transformers of this era may have contained PCBs.	55	Transformer Manufacturing, Processing and Use	PHCs, PCBs	OW07-32	MW	Metals**, PAHs, PCBs, VOCs, CN-, CrVI, EC, Hg, pH, SAR	Metals, ABN, BTEX, Chemistry, PAH, PHC, VOC, Cl, CrVI, CN-, Hg, EC, pH	PAHs (B(a)A, B(a)P, DahA, FLT, I(123-cd)P)	Metals (Zn) VOCs (TCE)	Current or historical sampling activities, or both, have captured the COCs in soil and groundwater. Table 6 Standards exceedances in soils included metals and PAHs. Table 6 Standards exceedances in groundwater included metals and VOCs. Sampling has captured the COCs, and the APEC has been addressed.
					TP13-03	TP	Metals, PAHs, PCBs, PHCs, VOCs, Hg	-	Metals (Zn)	-	
APEC-17	Capacitor Room - PCB-containing capacitors were present in the centre of the foundry, as first shown on the P&R investigationsite plan, and later remediated as part of the Earth Tech demolition (P&R, 1991; EarthTech, 1999). Activities included removal of a concrete floor, a utility trench located in the eastern section (concrete walls, granular base) that was heavily stained, a subfloor was present in the central section, and a sump located in on the eastern portion of the capacitor room that were all indicated as PCB-impacted and excavated and disposed offsite. The area was excavated to bedrock (1.0 - 1.3 mbgs) to remove concentrations above 5 ug/g. Final samples (composite soil, soil, concrete and bedrock) from the limits of excavation in the capacitor room reported PCB concentrations under 5 ug/g, with the exception of two bedrock samples within the eastern sump area that had concentrations around 10 ug/g. A well (OW25) was installed within the excavation area (the report for this installation was not available and therefore the soil conditions are unknown if analyzed as part of the investigation) and subsequent groundwater monitoring of the area have indicated concentrations of chlorinated VOCs and PHCs (mainly F3) above the applicable potable water criteria (Table 6 Standards) (DCS, 2007b, 2014b; AECOM, 2017a and 2017b).	55	Transformer Manufacturing, Processing and Use	PCBs, PHCs	C11	CH	Metals**, PCBs	-	Metals (Co,)	-	Current or historical sampling activities, or both, have captured the COCs in soil and groundwater. Table 6 Standards exceedances in soils included metals, PAHs, and PCBs. Table 6 Standards exceedances in groundwater included PAHs, PHCs, and VOCs. Sampling has captured the COCs, and the APEC has been addressed.

APEC-23	Paint Shop - First shown on the P&R Site plan, a paint shop was located at the north end of the site, between the shipping building and the storage area (P&R, 1991). Drums were stored against the north wall for materials used in the paint shop. The FIPs show this area as exterior yard area in the early FIPs (1916, 1929, 1946) and empty space between existing buildings in the 1960 FIP.	39	Paints Manufacturing, Processing and Bulk Storage	VOCs, PHCs, PAHs, metals	12SE10	TP	Metals**, CrVI, Hg	-	Metals (Cu, Mo, Zn)	-	Current or historical sampling activities, or both, have captured the COCs in soil and groundwater. APEC-24	PCB Storage Area - An area located at the northeast corner of the finishing and annealing room, with a concrete pad was identified in the Earth Tech investigation as a former PCB Storage area. Concentrations above 50 ppm of PCBs were identified. Previous site maps showed this area as 'storage' (P&R, 1991) or part of the Annealing Room (1946 and 1960 FIPs). During the demolition activities, approximately 250 kg of PCB-containing ash residue from the top of the concrete pad, and the concrete pad itself was removed and taken for offsite disposal (Earth Tech, 1999). Confirmatory samples below the pad were 0.63 and <0.05 ug/g. The soil was later excavated to bedrock as part of the soil remediation in the northeast corner of the property (see APEC-11).	55	Transformer Manufacturing, Processing and Use	PHCs, PCBs	BH07-46	BH	Metals**, PAHs, PCBs, VOCs	-	Metals (Cd, Pb, Zn)	-	Current or historical sampling activities, or both, have captured the COCs in soil and groundwater. APECs from Offsite PCAs to the North											
APEC-30 (Offsite North)	Rail Lines - Bordering the north side of the Site, rail lines are present (owned by Guelph Rail Line) and have existed since at least the early 1900s. Has historically been indicated as the Canadian Pacific Railway (1916, 1929, 1946, 1960 FIPs and P&R [1991]), Guelph Junction Railway (EarthTech, 1999; DCS, 2007a).	46	Rail Yards, Tracks and Spurs	VOCs, PHCs, PAHs, ABNs, CPs, metals	MW18-112D	MW	-	Metals, BTEX, VOC	-	Metals (As)	Current or historical sampling activities, or both, have captured the COCs in soil and groundwater. No Table 6 Standards exceedances in soils were identified. Table 6 Standards exceedances in groundwater included metals. Sampling has captured the COCs, and the APEC has been addressed.
	Paper Manufacturing - Companies at 309 Elizabeth Street have been listed in the Scott's Manufacturing Directory for paper related manufacturing: Trinity Graphics was established in 1977 and 1978 with a plant sizes of 3,000 and 50,000 m3 for paper bag and coated and treated paper manufacturing, all other converted paper product manufacturing, platemaking and related services; Independent Paper Converters was established in 1978 with a plant size of 56,000 m3 for manufacturing including paper bag, coated and treated paper, plastic film and sheet. The 1960 FIP indicated gummed paper manufacturing (Top Paper Products).	45	Pulp, Paper and Paperboard Manufacturing and Processing		MW18-112S	MW	-	Metals	-	Metals (As)	
					MW18-112G	MW	-	Metals, BTEX, VOC	-	BTEX (Bz), VOC (CHL, cis-1,2-DCE)	
	Auto Body Repair Shop - An automobile wrecking and recycling record was listed in the ERIS report for Sutton Auto Collision at 349 Elizabeth Street, which is an autobody repair facility. Additionally Top Gun Auto Painting & Collision is listed at this address from the City Directory.	10	Commercial Autobody Shops		MW18-113S	MW	-	Metals	-	None	
					MW18-113D	MW	-	Metals, BTEX, VOC	-	VOC (cis-1,2-DCE, TCE)	
	Automobile Repair - Two automotive repair shops are listed in the City Directory at 349 Elizabeth Street from approximately 2005.	27	Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation Vehicles		MW18-130D	MW	-	Metals, BTEX, PHC, VOC	-	BTEX (Bz), VOC (cis-1,2-DCE, VC)	
	Gasoline Station - A private fuel outlet with a 2,250 L liquid fuel double walled AST for gasoline is listed in the ERIS report for Oaks Precast Ind. Div. Standard Ind. at 351 Elizabeth Street with a license issue date of 1990. An additional record indicates a tank capacity of 36,500 L.	28	Gasoline and Associated Products Storage in Fixed Tanks								
	Trucking Company - A general freight trucking company (Polymer Distribution Inc.) is listed at 351 Elizabeth Street.	11	Commercial Trucking and Container Terminals		MW18-131S	MW	-	Metals, BTEX, PAH, PHC, VOC	-	Metals (Zn), VOC (cis-1,2-DCE, TCE)	
	Concrete Products Manufacturing - Lafarge Canada Inc. is listed at 351 Elizabeth Street, with a Scott's Manufacturing directory listing indicating an established date of 1933 and plant size of 50,000 ft3.	12	Concrete, Cement and Lime Manufacturing		MW18-133D	MW	-	Metals, BTEX, VOC	-	VOC (cis-1,2-DCE)	
	Plastic Products Manufacturing - ERIS and the City Directory searches indicate plastic products manufacturing at 53 Victoria Rd S. Scott's Manufacturing directory listings indicate Sterling Creations was established in 1983 with a 5,000 ft2 plant size, as well as Clear Choice Window Manufacturing established in 1990 with a 1,600 ft2 plant size.	43	Plastics (including Fibreglass) Manufacturing and Processing								
	Wire/Spring Manufacturing - ERIS searches list records for Guelph Wire Products which was established in 1974, plant size of 4,000 ft2 and manufactures steel springs, wire springs and miscellaneous fabricated wire products.	34	Metal Fabrication		OW02	MW	-	Metals, ABN, BTEX, CPs, Chemistry, PAH, PHC, VOC, Cl-Na, CrVI, CN-, Hg, EC, pH	-	None	
	Metal Valve Manufacturing - ERIS searches list records for DeNardis Industrial Sales Ltd. at 61 Victoria Rd S Unit C for metal valve manufacturing, established in 1985, plant size 4000 ft2. Former Spill - Spill records from ERIS indicated a release of diesel fuel in 2005 at 65 Victoria South.	34	Metal Fabrication		OW07-31	MW	Metals**, VOCs, CN-, CrVI, EC, Hg, pH, SAR	Metals, ABN, BTEX, CPs, Chemistry, PAH, PCBs, PHC, VOC, Cl, CrVI, CN-, Hg, EC, pH	None	Metals (As)	
	Electro-plating company - Holody Electro-Plating Limited is listed at 66 Victoria associated with metal product coating, iron and steel mills and ferro-alloy manufacturing since at 1955, with a plant size of 40,000 ft2 according to available records from ERIS. The 1960 FIP showed labeled buildings for plating, polishing, and an office.	33	Metal Treatment, Coating, Plating and Finishing		OW17	MW	-	Metals, BTEX, Chemistry, PAH, PHC, VOC, Cl, CrVI, CN-, Hg, EC, pH	-	None	
	Window and Door Manufacturing - Clear Choice Window Manufacturing Inc. and Richview Doors Ltd are listed in the Scott's Manufacturing Directory; established in 1990, and a 1,600 ft plant size. A spill at 75 Victoria Road South of a polymer emulsion (100lbs) in 2016 was reported.	43	Plastics (including Fibreglass) Manufacturing and Processing								
	Scrap Yard - B&F Scrap Dealers are listed at 100 Victoria Road South, with an automobile wrecking and recycling record in ERIS and listings in the city directory search from 1970 to 2011. A spill was reported at the property of a gasoline and water mixture (quantity not specified) in 2006 from cargo leaking to the ground.	49	Salvage Yard, including automobile wrecking		OW19	MW	-	Metals, ABN, BTEX, Chemistry, PAH, PHC, VOC, Cl, CrVI, CN-, Hg, EC, pH	-	Metals (Zn) VOCs (cis-1,2-DCE, PCE, TCE, VC)	
APECs from Offsite PCAs to the East											
APEC-31 (Offsite East)	Steel Valve Manufacturing - Guelph Engineering Co. was shown located at 10 Kingsmill Avenue, buildings on the 1960 FIP indicate steel valve manufacturing with a machine shop, pattern shop and oil house. Previous FIPs (1916, 1929 and 1946) show residences in this area.	32	Iron and Steel Manufacturing and Processing	VOCs, PHCs, PAHs, ABNs, CPs, metals, PCBs	MW18-129D	MW	Metals, Chemistry, PAH, PHC, EC, pH, SAR, CrVI, CN-, Hg	Metals, BTEX, Metals, VOC	Metals (Zn)	BTEX (Bnz) VOCs (cis-1,2-DCE, VC)	Current or historical sampling activities, or both, have captured the COCs in soil and groundwater. Table 6 Standards exceedances in soils included metals. Table 6 Standards exceedances in groundwater included metals, BTEX, PAHs, PHCs, and VOCs. Sampling has captured the COCs, and the APEC has been addressed.
					MW18-130D	MW	-	Metals, BTEX, PHC, VOC	-	BTEX (Bz), VOC (cis-1,2-DCE, VC)	
	Former Stove Manufacturer/Foundry - Guelph Stove Company was shown at 490 York Road on the 1916, 1929, 1946 and 1960 FIPs. Buildings included a foundry, storage (coke, coal, sand), milling room, pattern shops, plating and buffing, offices, warehouses, steel mounting room & blacksmith, crating, stove mounting, and oil. Transformers are shown on the enamel building. Operations existed until approximately the mid-1960s where the city directory listings indicate Franklin Manufacturing Co (Canada) LTD and then Resco Refrigeration Supplies Co LTD from approximately 1970. The facility became a multi-tenant commercial companies from the 1990s to present.	32	Iron and Steel Manufacturing and Processing		MW18-132D	MW	-	Metals, BTEX, PHC, VOC	-	VOC (cis-1,2-DCE, VC)	
					OW09-I	MW	-	Metals, BTEX, Chemistry, PAH, PHC, VOC, Cl, CrVI, CN-, Hg, EC, pH	-	Metals (Zn) VOCs (cis-1,2-DCE, TCE, VC)	
					OW09-II	MW	-	Metals, BTEX, Chemistry, PAH, PHC, VOC, Cl, CrVI, CN-, Hg, EC, pH	-	Metals (Pb), BTEX (Bnz), VOCs (cis-1,2-DCE, VC)	
					OW13	MW	-	Metals, ABN, BTEX, CPs, Chemistry, PAH, PHC, VOC, Cl, CrVI, CN-, Hg, EC, pH	-	Metals (Zn) VOCs (cis-1,2-DCE, TCE, VC)	

Table 6-4. APEC Disposition Table
200 Beverley Street, Guelph, Ontario

Areas of Potential Environmental Concern (APEC)	PCA [a.]		COCs (based on AP method groups [b,c])	Location Associated with APEC Area	Location Type	List of Parameter Groups tested (soil) [b.]	List of Parameter Groups Tested (GW) [b.]	List of Parameters above Table 6 (soil) [d.]	List of Parameters above Table 6 (GW) [d.]	Comments
Box Manufacturing - Packing manufacturers are listed at 136 Victoria Road South: Ellis Packing West Inc. listed as a corrugated and solid fibre box manufacturer; and ABCO Box and Carton Ltd. listed as a folding paperboard box manufacturer, established in 1946 with a plant size of 40,000 ft2. The 1960 FIP shows ABCO Box and Carton Co. Ltd with buildings labeled for office, pattern making, cutting, raw stock, stripping, gluing and finished stock. ABCO was present until approx. 2000 when Ellis Packing West replaced them as listed in the city directory.	45	Pulp, Paper and Paperboard Manufacturing and Processing		OW13-39D	MW	-	Metals, ABN, BTEX, Chemistry, PAH, PHC, VOC, Cl, CrVI, CN-, Hg, EC, pH	-	BTEX (Bnz) VOCs (1,1-DCE, cis-1,2-DCE, t-1,2-DCE, TCE, VC)	
				OW13-39S	MW	Metals, VOCs	Metals, ABN, BTEX, Chemistry, PAH, PHC, VOC, Cl, CrVI, CN-, Hg, EC, pH	Metals (Cd, Pb, Zn), VOCs (TCE)	VOCs (1,1-DCE, cis-1,2-DCE, t-1,2-DCE, TCE, VC)	
Potential USTs - On the 1960 FIP, McGregor Sportswear of Canada was shown to have 2 fuel oil USTs (2,500 gal each) on the property at 136 Victoria Rd S.	28	Gasoline and Associated Products Storage in Fixed Tanks		OW14	MW	-	Metals, BTEX, Chemistry, PAH, PHC, VOC, Cl, CrVI, CN-, Hg, EC, pH	-	Metals (Zn), VOCs (cis-1,2-DCE, TCE)	
Scrap Yard - Joe Brown & Son Ltd, a junk yard, is shown on the 1960 FIP at 150 Victoria; ERIS records include Hendersons Disposal Systems Ltd as the owner, and list the facility as a transfer service from 2000 to 2004, and 2005 as an Ontario numbered company.	49	Salvage Yard, including automobile wrecking		OW18-I	MW	-	Metals, ABN, BTEX, Chemistry, PAH, PHC, VOC, Cl, CrVI, CN-, Hg, EC, pH	-	Metals (Zn), VOCs (1,1-DCE, cis-1,2-DCE, t-1,2-DCE, TCE, VC), PAHs (B(a)P)	
Former Fuel Storage Facility - Multiple companies have been listed at 154 Victoria Rd S (Shell Canada Products, Doug Pollock Fuels Ltd, Granger Fuels) as an expired TSSA fuel storage facility with gasoline and diesel. A spill was reported in 1988 due to container overflow of 150 L of gasoline to the gravel surface. The 1946 FIP shows 6 gasoline USTs, and the 1960 FIP shows 13 gasoline USTs and an oil warehouse; both listed as Canadian Oil Companies Ltd.	28	Gasoline and Associated Products Storage in Fixed Tanks		OW18-II	MW	-	Metals, ABN, BTEX, Chemistry, PAH, PHC, VOC, Cl, CrVI, CN-, Hg, EC, pH	-	Metals (Zn), BTEX (Bnz), PHC (F2), VOCs (1,1-DCE, cis-1,2-DCE, t-1,2-DCE, TCE, VC)	
				OW19	MW	-	Metals, ABN, BTEX, Chemistry, PAH, PHC, VOC, Cl, CrVI, CN-, Hg, EC, pH	-	Metals (Zn) VOCs (cis-1,2-DCE, PCE, TCE, VC)	
Former Paint Application - A cabinet manufacturer was shown on the 1960 FIP, Gilson Manufacturing Co. Ltd. Cabinet Division at 57 Victoria Rd S with buildings labeled for steel storage, tubing room, steel room, washer, dryer, office, paint spray, transformer.	39	Paints Manufacturing, Processing and Bulk Storage		OW24D	MW	-	Metals, ABN, BTEX, Chemistry, PHC, VOC, Cl, CrVI, CN-, Hg, EC, pH	-	Metals (Zn), PHC (F1), VOCs (1,1-DCE, cis-1,2-DCE, t-1,2-DCE, TCE, VC)	
Chemical Manufacturer or Distributor - Robert On Guard Products was listed in the chemical facilities records.	8	Chemical Manufacturing, Processing and Bulk Storage		OW24S	MW	-	Metals, ABN, BTEX, CPs, Chemistry, PAH, PCB, PHC, VOC, Cl, CrVI, CN-, Hg, EC, pH	-	Metals (Zn), VOCs (1,1-DCE, cis-1,2-DCE, t-1,2-DCE, TCE)	
Transformers - The National PCB records list up to 7 transformers on 490 York Road associated with Sherwood Forest Investments (formerly Hamril Investments). The volumes listed total approximately 1,600 L. Transformers (7 total) are shown on the 1960 FIP on the enameling building of Guelph Stove Co. Ltd.	55	Transformer Manufacturing, Processing and Use		OW31	MW	-	Metals, BTEX, PAHs, PCB, PHC, VOC, CrVI, Cl-, Hg	-	VOCs (1,1-DCE, Bnz, cis-1,2-DCE, t-1,2-DCE, TCE, VC), PHCs (F2, F3, F4)	
APECs from Offsite PCAs to the South										
APEC-32 (Offsite South) Screw Manufacturing - Linread Canada Ltd. is shown on the 1960 FIP as a screw manufacturer, and is listed in ERIS reports as a industrial fastener at 24 Hayes with records until 1998. "Jet" is listed as a manufacturer of metal dies at this location with records between 1993 and 1998. Multiple Scott's Directory listings are reported for this address for machinery/equipment/ industrial fan and fabricated metal tools/product manufacturing (Daltec Industries, Allen Simpson Marketing and Design) with established dates of 1984 and 1975, and records up to 2006. A spill was reported of slurry to the road in 2014.	34	Metal Fabrication	VOCs, PHCs, PAHs, metals	MW18-122D	MW	Metals, Chemistry, PAH, EC, pH, SAR, CrVI, CN-, Hg	BTEX, VOC	None	VOCs (1,1-DCA, cis-1,2-DCE)	Current or historical sampling activities, or both, have captured the COCs in soil and groundwater. Table 6 Standards exceedances in soils included metals. Table 6 Standards exceedances in groundwater included metals and VOCs. Sampling has captured the COCs, and the APEC has been addressed.
				MW18-122G	MW	-	BTEX, VOC	-	None	
				MW18-123D	MW	Metals, BTEX, Chemistry, PAH, VOC, EC, pH, SAR, CrVI, CN-, Hg	BTEX, VOC	Metals (Cd, Pb, Zn)	VOCs (cis-1,2-DCE)	
				MW18-123S	MW	-	BTEX, VOC	-	VOCs (cis-1,2-DCE, TCE)	
				OW10	MW	-	Metals, BTEX, Chemistry, PAH, PHC, VOC, Cl, CrVI, CN-, Hg, EC, pH	-	None	
Former USTs - One gasoline UST is shown on the 1960 FIP on the south side of the building at Traders' Plumbing and Heating Supplies Limited at 150 Stevenson Street South.	28	Gasoline and Associated Products Storage in Fixed Tanks		OW11-I	MW	-	Metals, BTEX, Chemistry, PAH, PHC, VOC, Cl, CrVI, CN-, Hg, EC, pH	-	None	
				OW11-II	MW	-	Metals, BTEX, Chemistry, PAH, PHC, VOC, Cl, CrVI, CN-, Hg, EC, pH	-	VOCs (TCA, 1,1-DCA, 1,1-DCE, VC)	
Former Transportation Company - The 1960 FIP indicates a transportation company (Direct Winter's Transport) at 101 Beverley and city directories the company was present from the early 1950s to 1960s.	11	Commercial Trucking and Container Terminals		OW26D	MW	-	Metals, ABN, BTEX, Chemistry, PAH, PHC, VOC, Cl, CrVI, CN-, Hg, EC, pH	-	VOCs (cis-1,2-DCE)	
				OW26S	MW	-	Metals, ABN, BTEX, Chemistry, PCB, PAH, PHC, VOC, Cl, CrVI, CN-, Hg, EC, pH	-	Metals (Zn), VOCs (1,1-DCA)	
APECs from Offsite PCAs to the West										
APEC-33 (Offsite West) Window Manufacturing - Clear Choice Window Manufacturing Inc. is listed in the Scott's Manufacturing Directory; established in 1990, and a 1,600 ft plant size.	43	Plastics (including Fibreglass) Manufacturing and Processing	VOCs, PHCs, PAHs, metals	MW18-120D	MW	Metals	Metals, BTEX, VOC	Metals (Cd, Zn)	None	Current or historical sampling activities, or both, have captured the COCs in soil and groundwater. Table 6 Standards exceedances in soils included metals. Table 6 Standards exceedances in groundwater included metals and VOCs. Sampling has captured the COCs, and the APEC has been addressed.
Metal Treatment - Choice Enterprises is listed in the Scott's Manufacturing Directory; as coating, engraving, heat treating, and allied activities; established in 1998.	33	Metal Treatment, Coating, Plating and Finishing								
Spring Manufacturing - ERIS records indicate heavy gauge spring manufacturing at 60 Johnston Street as Steele Bros. Ltd., the Scott's manufacturing directory record indicates the company was established in 1986 with a plant size of 6,500 ft2. The 1960 FIP shows the H.I. Thompson Co. of Canada Limited (Aircraft Insulation) with a factory, spring room, spray room, transformer, and cement storage.	34	Metal Fabrication								
Former Refractory Facility - Former Foundry Services of Canada (FOSECO) facility operated at 201 Alice Street until approximately the late 1990s, had a known contaminated plume in the shallow groundwater occurring at the bedrock/overburden interface, migrating northward and a groundwater treatment system for toluene (P&R, 1991). A certificate of approval record was issued in 1989 to Foseco for the toluene stripper for groundwater. The 1960 FIP indicates the following buildings: tablet making, lab, shipping, mixing, warehouse, ball mill, elevator, transformer, oil storage, blending, mouldable exothermic feeding compound, incinerator.	34	Metal Fabrication		OW12	MW	-	Metals, BTEX, Chemistry, PAH, PHC, VOC, Cl, CrVI, CN-, Hg, EC, pH	-	Metals (Zn), VOCs (TCA)	
Motor Vehicle Parts Manufacturing - BP Canada Energy Company is listed in ERIS operating at 201 Alice Street.	57	Vehicles and Associated Parts Manufacturing		OW15	MW	-	Metals, BTEX, Chemistry, PAH, PCB, PHC, VOC, Cl, CrVI, CN-, Hg, EC, pH	-	None	
Former Spill - A spill was reported at the corner of Alice and Stevensons Street of 15 L of windshield washer fluid and antifreeze to a catch basin a motor vehicle accident in 2016.	27	Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation Vehicles		OW16	MW	-	Metals, BTEX, Chemistry, PAH, PCB, PHC, VOC, Cl, CrVI, CN-, Hg, EC, pH	-	None	

Notes:
Information provided in this table is limited to detected parameters exceeding the MOE Standards. MDLs which exceed the MOE Standards can be found in the results tables provided in Section 6.

[a.] PCA – Potentially contaminating activity (as defined by O. Reg 153/04, as amended), (*) best fit available where starred.

[b.] AP Method groups as defined in the "*Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act*" dated July 1, 2011.

FLRN = fluorene
FLT = fluoranthene
GW = groundwater
Hg = mercury
I(123-cd)P = ideno(1,2,3-cd)pyrene
MDL = method detection limit
MECP = Ontario Ministry of Environment, Conservation and Parks
MNAP = 1,2-methylnaphthalene
Mo = molybdenum
MW = monitoring well
NAP = naphthalene
Ni = nickel
PAHs = polyaromatic hydrocarbons
Pb = lead
PCA = potentially contaminating activity
PCBs = polychlorinated biphenyls
PCE = tertrachloroethene
pH = pH
PHCs = petroleum hydrocarbons
PHE = phenanthrene
PYR = pyrene
RK =
SAR = sodium adorption ratio
Sb = antimony
SS = soil sample
trans-1,2-DCE = trans-1,2-dichloroethene
TCA = trichloroethane
TCE = trichloroethylene
Tl = thalium
TP = test pit
TSSA = technical standards and safety authority
UST = underground storage tank
VC = vinyl chloride
VOCs = volitile organic compounds
XYL = xylenes
Zn = zinc

Notes:

µg/g = microgram per gram

ABN = acid base neutrals

BTEX = benzene, toluene, ethylbenzene, xylenes

FD = Field duplicate

mbgs = metre below ground surface

mS/cm = millisiemen per centimetre

N = Normal sample

PAH = polycyclic aromatic hydrocarbons

PCB = polychlorinated biphenyls

PHC = petroleum hydrocarbon

SAR = sodium absorption ratio

SDG = sample delivery group

VOC = Volatile organic compound

Table 6-7c. Contaminants of Concern Identified in Soil
200 Beverley Street, Guelph, Ontario

Soil Contaminants of Concern	
2-(1-)Methylnaphthalene	Fluorene
Acenaphthene	Indeno(1,2,3-Cd)Pyrene
Acenaphthylene	Lead
Anthracene	Mercury
Antimony	Molybdenum
Arsenic	Naphthalene
Benzene	Nickel
Benzo(a)anthracene	PCB, Total
Benzo(a)pyrene	Petroleum Hydrocarbons F2 (C10-C16)
Benzo(b)fluoranthene	Petroleum Hydrocarbons F3 (C16-C34)
Benzo(g,h,i)perylene	Petroleum Hydrocarbons F4 (C34-C50)
Benzo(k)fluoranthene	Phenanthrene
Cadmium	Pyrene
Chrysene	Thallium
Cobalt	Trichloroethylene
Copper	Vanadium
Dibenzo(a,h)anthracene	Xylenes, Total
Ethylbenzene	Zinc
Fluoranthene	

F = fraction

PCB = polychlorinated biphenyls

Notes:

µg/L = microgram per litre

ABN = acid base neutrals

BTEX = benzene, toluene, ethylbenzene, xylenes

FD = Field duplicate

mbgs = metre below ground surface

N = Normal sample

PAH = polycyclic aromatic hydrocarbons

PCB = polychlorinated biphenyls

PHC = petroleum hydrocarbon

SAR = sodium absorption ratio

SDG = sample delivery group

VOC = Volatile organic compound

Table 6-10c. Contaminants of Concern Identified in Groundwater
200 Beverley Street, Guelph, Ontario

Groundwater Contaminants of Concern	
1,1,1-Trichloroethane	Fluoranthene
1,1-Dichloroethane	Lead
1,1-Dichloroethene	Naphthalene
2-(1-)Methylnaphthalene	n-Hexane
Acenaphthene	Petroleum Hydrocarbons F1 (C6-C10)
Anthracene	Petroleum Hydrocarbons F2 (C10-C16)
Arsenic	Petroleum Hydrocarbons F3 (C16-C34)
Benzene	Petroleum Hydrocarbons F4 (C34-C50)
Benzo(a)anthracene	Phenanthrene
Benzo(a)pyrene	Pyrene
Benzo(b&j)fluoranthene	Tetrachloroethene
Benzo(k)fluoranthene	trans-1,2-Dichloroethene
Chrysene	Trichloroethylene
cis-1,2-Dichloroethene	Vinyl Chloride
Ethylbenzene	Zinc

F = fraction

Silt (Native)
Stone Road Member (Eramosa Formation)
Reformatory Quarry Member (Eramosa Formation)
Vinemount Member (Eramosa Formation)
Ancaster Member (Goat Island Formation)
Niagara Falls Member Grainstone (Goat Island Formation)

Notes:
1. Ground surface elevations at borehole locations may be different than current grade as some locations are projected onto the cross-section line and ground surface elevations may have changed since the time of drilling for historical locations.
2. The offsite distance from the cross-section line are shown in brackets following the location ID.
3. masl = metres above sea level
4. Stratigraphic units presented on the cross-sections are based on Jacobs' interpretation of the Site's geology and may differ from those noted on logs from investigations by others.
5. The average water table elevation of 312.9 masl for monitoring events between December 2017 and August 2018 is presented. Groundwater elevations at the Site ranged between 312.5 and 313.7 masl during this period.

Sample Locations
- Borehole
- Confirmatory
- Monitoring Well
- Other
- Test Pit

- No Exceedance
- Exceedance
- Cross Section Location

- Former IMICO Property Boundary
- Historical Excavation area, EarthTech, 1999
- Horizontal Delineation

Notes:
1. Locations are approximate. All samples, including those within excavation areas that have been removed (i.e. prior to 1999) have been shown for screening purposes.
2. Results in ( ) indicate field duplicates.
3. "J" indicates associated value is estimated.
4. Red text indicates the location of the Site maximum concentration of the analyte.
5. The estimated extent of impacts was inferred to extend from sampling locations that exceeded the Standards to the next available sampling location that did not exceed the Standards and extrapolated to the property boundary, where applicable.

Notes:
1. Ground surface elevations at borehole locations may be different than current grade as some locations are projected onto the cross-section line and ground surface elevations may have changed since the time of drilling for historical locations.
2. The offsite distance from the cross-section line are shown in brackets following the location ID.
3. masl = metres above sea level
4. Stratigraphic units presented on the cross-sections are based on Jacobs' interpretation of the Site's geology and may differ from those noted on logs from investigations by others.
5. The average water table elevation of 312.9 masl for monitoring events between December 2017 and August 2018 is presented. Groundwater elevations at the Site ranged between 312.5 and 313.7 masl during this period.

- No Exceedance
- Exceedance
- Cross Section Location

- Former IMICO Property Boundary
- Historical Excavation area, EarthTech, 1999
- Horizontal Delineation

Notes:
1. Locations are approximate. All samples, including those within excavation areas that have been removed (i.e. prior to 1999) have been shown for screening purposes.
2. Results in ( ) indicate field duplicates.
3. "J" indicates associated value is estimated.
4. Red text indicates the location of the Site maximum concentration of the analyte.
5. The estimated extent of impacts was inferred to extend from sampling locations that exceeded the Standards to the next available sampling location that did not exceed the Standards and extrapolated to the property boundary, where applicable.

Silt (Native)
Stone Road Member (Eramosa Formation)
Reformatory Quarry Member (Eramosa Formation)
Vinemount Member (Eramosa Formation)
Ancaster Member (Goat Island Formation)
Niagara Falls Member Grainstone (Goat Island Formation)

Notes:
1. Ground surface elevations at borehole locations may be different than current grade as some locations are projected onto the cross-section line and ground surface elevations may have changed since the time of drilling for historical locations.
2. The offsite distance from the cross-section line are shown in brackets following the location ID.
3. masl = metres above sea level
4. Stratigraphic units presented on the cross-sections are based on Jacobs' interpretation of the Site's geology and may differ from those noted on logs from investigations by others.
5. The average water table elevation of 312.9 masl for monitoring events between December 2017 and August 2018 is presented. Groundwater elevations at the Site ranged between 312.5 and 313.7 masl during this period.
6.*See Plan View. Vertical delineation is based on extent of horizontal delineation along section location.

Ancaster Member (Goat Island Formation)
Niagara Falls Member Grainstone (Goat Island Formation)

Notes:
1. Ground surface elevations at borehole locations may be different than current grade as some locations are projected onto the cross-section line and ground surface elevations may have changed since the time of drilling for historical locations.
2. The offsite distance from the cross-section line are shown in brackets following the location ID.
3. masl = metres above sea level
4. Stratigraphic units presented on the cross-sections are based on Jacobs' interpretation of the Site's geology and may differ from those noted on logs from investigations by others.
5. The average water table elevation of 312.9 masl for monitoring events between December 2017 and August 2018 is presented. Groundwater elevations at the Site ranged between 312.5 and 313.7 masl during this period.
6.*See Plan View. Vertical delineation is based on extent of horizontal delineation along section location.

- Test Pit

Excavated Locations
- Confirmatory
- Monitoring Well
- Other
- Test Pit

- No Exceedance
- Exceedance
- Cross Section Location

- Former IMICO Property Boundary
- Historical Excavation area, EarthTech, 1999
- Horizontal Delineation

Notes:
1. Locations are approximate. All samples, including those within excavation areas that have been removed (i.e. prior to 1999) have been shown for screening purposes.
2. Results in ( ) indicate field duplicates.
3. "J" indicates associated value is estimated.
4. Red text indicates the location of the Site maximum concentration of the analyte.
5. The estimated extent of impacts was inferred to extend from sampling locations that exceeded the Standards to the next available sampling location that did not exceed the Standards and extrapolated to the property boundary, where applicable.

Figure 6-10
Soil Exceedances - PCB

No Exceedance
Vertical Delineation

Fill
Silt (Native)
Stone Road Member (Eramosa Formation)
Reformatory Quarry Member (Eramosa Formation)
Vinemount Member (Eramosa Formation)
Ancaster Member (Goat Island Formation)

Notes:
1. Ground surface elevations at borehole locations may be different than current grade as some locations are projected onto the cross-section line and ground surface elevations may have changed since the time of drilling for historical locations.
2. The offsite distance from the cross-section line are shown in brackets following the location ID.
3. masl = metres above sea level
4. Stratigraphic units presented on the cross-sections are based on Jacobs' interpretation of the Site's geology and may differ from those noted on logs from investigations by others.
5. The average water table elevation of 312.9 masl for monitoring events between December 2017 and August 2018 is presented. Groundwater elevations at the Site ranged between 312.5 and 313.7 masl during this period.
6.*See Plan View. Vertical delineation is based on extent of horizontal delineation along section location.

3. masl = metres above sea level
4. Stratigraphic units presented on the cross-sections are based on Jacobs' interpretation of the Site's geology and may differ from those noted on logs from investigations by others.
5. The average water table elevation of 312.9 masl for monitoring events between December 2017 and August 2018 is presented. Groundwater elevations at the Site ranged between 312.5 and 313.7 masl during this period.

3. masl = metres above sea level
4. Stratigraphic units presented on the cross-sections are based on Jacobs' interpretation of the Site's geology and may differ from those noted on logs from investigations by others.
5. The average water table elevation of 312.9 masl for monitoring events between December 2017 and August 2018 is presented. Groundwater elevations at the Site ranged between 312.5 and 313.7 masl during this period.

Approximate Groundwater Elevation
Exceedance
No Exceedance
Vertical Delineation
Vertical Delineation Inferred Extent

Fill
Silt (Native)
Stone Road Member (Eramosa Formation)
Reformatory Quarry Member (Eramosa Formation)
Vinemount Member (Eramosa Formation)
Ancaster Member (Goat Island Formation)
Niagara Falls Member Grainstone (Goat Island Formation)

DRAFT

Notes:
1. Ground surface elevations at borehole locations may be different than current grade as some locations are projected onto the cross-section line and ground surface elevations may have changed since the time of drilling for historical locations.
2. The offsite distance from the cross-section line are shown in brackets following the location ID.
3. masl = metres above sea level
4. Stratigraphic units presented on the cross-sections are based on Jacobs' interpretation of the Site's geology and may differ from those noted on logs from investigations by others.
5. The average water table elevation of 312.9 masl for monitoring events between December 2017 and August 2018 is presented. Groundwater elevations at the Site ranged between 312.5 and 313.7 masl during this period.

Attachment C
Sampling and Analysis Plan

Attachment C: Table C-1

Revision 7, January 17, 2019

Phase Two ESA Sampling and Analytical Plan: IMICO

Location ID	Existing or New Location	Media	Approx. Depth to Bedrock (m)	Approx. Depth of TP/BH/MW (m)	O.Reg. 511 Metals & Inorganics	O. Reg. 153/04 Hydride-forming Metals (Sb, As, Se)	O. Reg. 153/04 Metals only (Section 1.2.2 in Protocol Doc)	PAHs (lab filter for B(a)P)	PHCs	BTEX	VOCs	PCB Aroclors	Purpose and Justification
MW18-114D	Existing	Groundwater	--	--		1							Second resample for antimony to confirm meets the SCS. No exceedance in previous sample.
OW07-37	Existing	Groundwater	--	--			1						Second resample for zinc to confirm meets the SCS. No exceedance in previous sample.
OW23D	Existing	Groundwater	--	--					1				Second resample for PHC F3 to confirm meets the SCS. No exceedance in previous sample.
OW25	Existing	Groundwater	--	--					1				Second resample for PHC F2 and PHC F3 to confirm meets the SCS. No exceedance in previous sample.
OW24D	Existing	Groundwater	--	--					1				Second resample for PHC F1 to confirm meets the SCS. No exceedance in previous sample.
OW3-I	Existing	Groundwater	--	--				1					Second resample for benzo(a)pyrene to confirm meets the SCS. No exceedance in the previous sample.
OW25	Existing	Groundwater	--	--				1					Isolated benzo(a)pyrene exceedance, not vertically delineated. Two options (below) based on the results of this sample.
OW25	Existing	Groundwater	--	--				1					If the first benzo(a)pyrene sample from OW25 meets the SCS, complete a second PAHs resample at OW25.
MW18-126D	Existing	Groundwater	--	--				1					If the first benzo(a)pyrene sample at OW25 does not meet the SCS, do not resample OW25, but sample the deeper MW18-126D for vertical delineation.
TP19-320	New	Soil	--	--							2		Cardinal direction horizontal and vertical delineation of TCE soil impacts at MW17-102D. Sample generally between 0.15 and 0.3 mbgs and 1.83 and 2.13 mbgs (or right above bedrock) for vertical delineation.
TP19-321	New	Soil	--	--							2		Cardinal direction horizontal and vertical delineation of TCE soil impacts at MW17-102D. Sample generally between 0.15 and 0.3 mbgs and 1.83 and 2.13 mbgs (or right above bedrock) for vertical delineation.
TP19-322	New	Soil	--	--							2		Cardinal direction horizontal and vertical delineation of TCE soil impacts at MW17-102D. Sample generally between 0.15 and 0.3 mbgs and 1.83 and 2.13 mbgs (or right above bedrock) for vertical delineation.
TP19-323	New	Soil	--	--							2		Cardinal direction horizontal and vertical delineation of TCE soil impacts at MW17-102D. Sample generally between 0.15 and 0.3 mbgs and 1.83 and 2.13 mbgs (or right above bedrock) for vertical delineation.
BH19-209	New	Soil	--	--							2		Horizontal delineation of TCE impacts in soil north of BH13-40 and OW13-39S. Collect above the water table from surface and at depth.
BH19-210	New	Soil	--	--							2		Horizontal delineation of TCE impacts in soil south of BH18-204. Collect above the water table from surface and at depth.
BH19-211	New	Soil	--	--							2		Horizontal delineation of TCE impacts in soil south of BH18-205. Collect above the water table from surface and at depth.
BH17-100i	New	Soil	--	1	pH only								Additional sampling required at location of elevated pH. Advance borehole within 1-2 m of MW17-100S and collect sample from exact interval (0.3-0.46 mbgs). Ensure absolutely no concrete/ concrete dust from coring is in sample collected.
BH17-100ii	New	Soil	--	1	pH only								Additional sampling required at location of elevated pH. Advance borehole within 1-2 m of MW17-100S and collect sample from exact interval (0.3-0.46 mbgs). Ensure absolutely no concrete/ concrete dust from coring is in sample collected.
OW07-32	Existing	Groundwater	--	--								1	APEC-16 (Transformers) lists PCBs as COPCs in groundwater, but PCBs have not been sampled in groundwater to date within this APEC.

Notes:

mbgs - metres below ground surface
Standards refers to Ministry of Environment and Climate Change "Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act" dated July 1, 2011
RPI - Residential, Parkland and Institutional Property Use
The following field parameters will be measured in groundwater during well purging: pH, ORP, DO, Temperature turbidity and Specific Conductance

Notes:
1. Service Layer Credits: Source: Esri, DigitalGlobe, GeoEye, Earthstar Geographics, CNES/Airbus DS, USDA, USGS, AeroGRID, IGN, and the GIS User Community
2. Property boundaries, roads obtained from http://open.guelph.ca/.
3. All samples, including those within excavation areas that have been removed (i.e. prior to 1999) have been shown for screening purposes.

Table 6 Site Condition Standards
200 Beverley Street, Guelph, Ontario

Contaminant [a]	Contaminant Identifier	Maximum Measured Concentration [b]	Units	Minimum Detection Limit (MDL)	Applicable Site Condition Standard (SCS) [c]	Potential for Exceedance of Applicable SCS at Nearest Offsite Receptor?	Retained as a Contaminant for Risk Assessment? (Rationale)
Bromodichloromethane	75274	0.05	µg/g	0.003	1.5	No	No, excluded (Max < or = Table 6 SCS)
Bromoform	75252	0.05	µg/g	0.002	0.27	No	No, excluded (Max < or = Table 6 SCS)
Bromomethane	74839	0.05	µg/g	0.002	0.05	No	No, excluded (Max < or = Table 6 SCS)
Butyl benzyl phthalate	85687	0.5	µg/g	0.5	--	--	No, excluded (no standard available; all results non-detect)
Carbon tetrachloride	56235	0.05	µg/g	0.002	0.05	No	No, excluded (Max < or = Table 6 SCS)
Chloride (Cl)	16887006	122	µg/g	0.2	--	--	No, excluded (Max < or = OTR Value)
Chlorobenzene	108907	0.05	µg/g	0.002	2.4	No	No, excluded (Max < or = Table 6 SCS)
Chlorodibromomethane	124481	0.05	µg/g	0.05	2.3	No	No, excluded (Max < or = Table 6 SCS)
Chloroethane	75003	0.08	µg/g	0.005	--	--	No, excluded (no standard available; all results non-detect)
Chloroform	67663	0.05	µg/g	0.002	0.05	No	No, excluded (Max < or = Table 6 SCS)
Chloromethane	74873	2	µg/g	0.002	--	--	No, excluded (no standard available; all results non-detect)
Chromium	7440473	84.7	µg/g	0.3	160	No	No, excluded (Max < or = Table 6 SCS)
Chromium, Hexavalent (Cr6+)	18540299	0.4	µg/g	0.2	8	No	No, excluded (Max < or = Table 6 SCS)
cis-1,2-Dichloroethene	156592	0.05	µg/g	0.002	1.9	No	No, excluded (Max < or = Table 6 SCS)
Cyanide	57125	0.05	µg/g	0.05	0.051	No	No, excluded (Max < or = Table 6 SCS)
Dichlorodifluoromethane	75718	0.05	µg/g	0.05	16	No	No, excluded (Max < or = Table 6 SCS)
Dichloromethane	75092	0.05	µg/g	0.002	0.1	No	No, excluded (Max < or = Table 6 SCS)
Diethylphthalate	84662	0.5	µg/g	0.1	0.5	No	No, excluded (Max < or = Table 6 SCS)
Dimethylphthalate	131113	0.5	µg/g	0.1	0.5	No	No, excluded (Max < or = Table 6 SCS)
Di-N-Butylphthalate	84742	0.2	µg/g	0.2	--	--	No, excluded (no standard available; all results non-detect)
Di-n-octyl phthalate	117840	0.5	µg/g	0.5	--	--	No, excluded (no standard available; all results non-detect)
Electrical Conductivity	COND	0.514	mS/cm	0.002	0.7	No	No, excluded (Max < or = Table 6 SCS)
Hexachlorobenzene	118741	0.5	µg/g	0.5	0.52	No	No, excluded (Max < or = Table 6 SCS)
Hexachlorocyclopentadiene	77474	2	µg/g	2	--	--	No, excluded (no standard available; all results non-detect)
Isophorone	78591	0.2	µg/g	0.2	--	--	No, excluded (no standard available; all results non-detect)
Manganese	7439965	1810	µg/g	1	--	--	No, excluded (Max < or = OTR Value)
Methyl tert-butyl ether (MTBE)	1634044	0.06	µg/g	0.004	0.75	No	No, excluded (Max < or = Table 6 SCS)
n-Hexane	110543	0.861	µg/g	0.05	2.8	No	No, excluded (Max < or = Table 6 SCS)
Nitrobenzene	98953	0.2	µg/g	0.2	--	--	No, excluded (no standard available; all results non-detect)
N-Nitrosodi-N-propylamine	621647	1	µg/g	1	--	--	No, excluded (no standard available; all results non-detect)
N-Nitrosodiphenylamine	86306	0.5	µg/g	0.5	--	--	No, excluded (no standard available; all results non-detect)
Pentachlorophenol	87865	0.1	µg/g	0.1	0.1	No	No, excluded (Max < or = Table 6 SCS)
Petroleum Hydrocarbons F1 (C6-C10)	PHC_F1	20	µg/g	5	55	No	No, excluded (Max < or = Table 6 SCS)
Phenol	108952	1.3	µg/g	0.01	9.4	No	No, excluded (Max < or = Table 6 SCS)
Potassium	7440097	2000	µg/g	10	--	--	No, excluded (Max < or = OTR Value)
Selenium	7782492	1	µg/g	0.22	2.4	No	No, excluded (Max < or = Table 6 SCS)
Silver	7440224	7.8	µg/g	0.2	20	No	No, excluded (Max < or = Table 6 SCS)
Sodium Absorption Ratio	SAR	2	SAR	0.1	5	No	No, excluded (Max < or = Table 6 SCS)
Styrene	100425	0.05	µg/g	0.002	0.7	No	No, excluded (Max < or = Table 6 SCS)
Tetrachloroethene	127184	0.05	µg/g	0.002	0.28	No	No, excluded (Max < or = Table 6 SCS)

Table D-1. Summary of COC Screening in Soil
Table 6 Site Condition Standards
200 Beverley Street, Guelph, Ontario

Contaminant [a]	Contaminant Identifier	Maximum Measured Concentration [b]	Units	Minimum Detection Limit (MDL)	Applicable Site Condition Standard (SCS) [c]	Potential for Exceedance of Applicable SCS at Nearest Offsite Receptor?	Retained as a Contaminant for Risk Assessment? (Rationale)
Tin	7440315	9.6	µg/g	5	--	--	No, excluded (Max < or = CCME Value)
Titanium	7440326	532	µg/g	0.5	--	--	No, excluded (Max < or = OTR Value)
Toluene	108883	1.2	µg/g	0.002	2.3	No	No, excluded (Max < or = Table 6 SCS)
trans-1,2-Dichloroethene	156605	0.05	µg/g	0.003	0.084	No	No, excluded (Max < or = Table 6 SCS)
Trichlorofluoromethane	75694	0.08	µg/g	0.004	4	No	No, excluded (Max < or = Table 6 SCS)
Uranium	7440611	2.6	µg/g	0.05	23	No	No, excluded (Max < or = Table 6 SCS)
Vinyl Chloride	75014	0.02	µg/g	0.002	0.02	No	No, excluded (Max < or = Table 6 SCS)
Zirconium	7440677	19	µg/g	--	--	--	No, excluded (Max < or = OTR Value)

Source:
MECP. 2011. *Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act.* April 15.
Notes:
Bold parameters are identified as COCs.

[a.] The representative maximum concentration (the maximum concentration of similar analytes or total concentration of multiple isomers) is used for comparison.

[b.] Column lists the greater of the maximum detected concentration and the maximum nondetect concentration.

[c.] Ontario Regulation 153/04, *Table 6: Full Depth Generic Site Condition Standards for Shallow Soils in a Potable Ground Water Condition* for Residential/Parkland/Institutional Property Use (MECP, 2011).

-- = no value or not applicable
> = greater than
< = less than
µg/g = microgram per gram
COC = contaminant of concern
DND = Department of National Defence
EXP = Explosives
F = fraction
Max = maximum concentration
MDL = method detection limit
Ministry = Ontario Ministry of the Environment, Conservation and Parks
mS/cm = milliSiemen per centimetre
NA = not available
No. = number
PCB = polychlorinated biphenyl
PHC = petroleum hydrocarbon
SCS = Site Condition Standard

MECP. 2011. *Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act.* April 15.

[a] The representative maximum concentration (the maximum concentration of similar analytes or total concentration of multiple isomers) is used for comparison.

[b] Column lists the greater of the maximum detected concentration and the maximum nondetect concentration.

[c] Ontario Regulation 153/04, *Table 6: Full Depth Generic Site Condition Standards for Shallow Soils in a Potable Ground Water Condition* for Residential/Parkland/Institutional Property Use (MECP, 2011).

Notes:

Bold parameters are identified as COCs

-- = no value or not applicable
> = greater than
< = less than
µg/L = microgram(s) per litre
ABN = acid base neutral compounds
BTEX = benzene, toluene, ethylbenzene, and xylenes
PAH = polycyclic aromatic hydrocarbon
PCB = polychlorinated biphenyl
PGMIS = provincial grounwater monitoring information system
PHC = petroleum hydrocarbon
SCS = Site Condition Standard
VOC = volatile organic compound

Table D-2. Summary of COC Screening in Groundwater

Table 6 Site Condition Standards

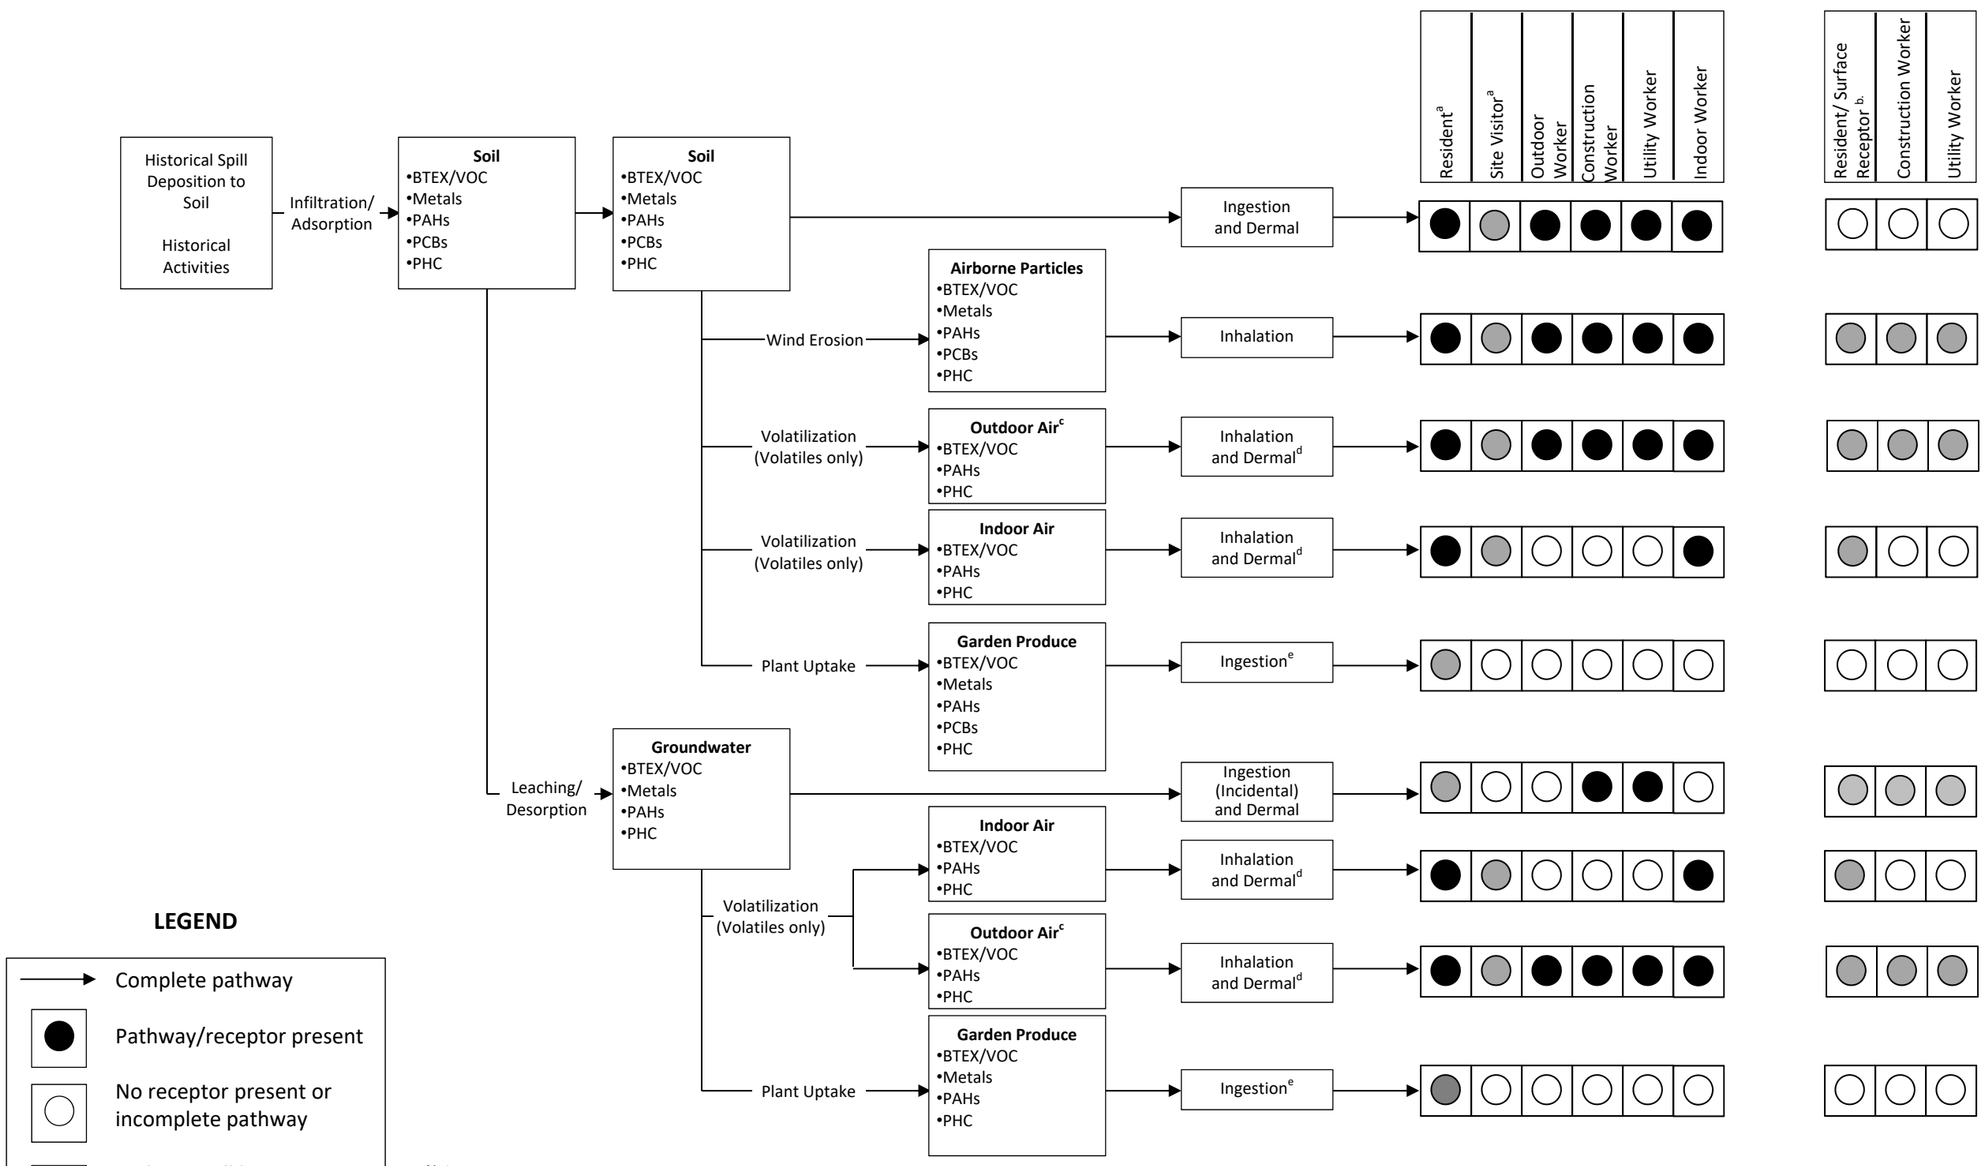
200 Beverley Street, Guelph, Ontario

Contaminant [a]	Contaminant Identifier	Maximum Measured Concentration [b]	Units	Minimum Detection Limit	Applicable SCS [c]	Potential for Exceedances of Applicable SCSs at Nearest Offsite Receptors?	Retained as a Contaminant for Risk Assessment? (Rationale)

COC = contaminant of concern

CP = chlorophenol

Attachment E
Human Health and Ecological Conceptual Site Models



Notes:

a. Resident and Site Visitors from all age categories would be anticipated to frequent the site under a parkland, residential, commercial, or community redevelopment scenario.
b. Surface Receptor incorporates offsite surface receptors (that is, receptors not engaged in subsurface excavation activities), such as indoor workers, residents, visitors, outdoor workers, or patrons of nearby properties that may be exposed to dust (soil particulates) or groundwater migrating offsite during the redevelopment of the property in the absence of RMMs.
c. Outdoor air inhalation includes both ambient and trench air inhalation, as appropriate.
d. Dermal exposure to vapours is a negligible pathway and will not be considered quantitatively.
e. There is high uncertainty associated with assessing the potential exposure to site COCs through ingestion of garden produce; therefore, this pathway will not be considered quantitatively.

BTEX = benzene, toluene, ethylbenzene, and xylenes
COC = contaminant of concern
PAH = polycyclic aromatic hydrocarbon
PHC = petroleum hydrocarbon
VOC = volatile organic compound
PCB = polychlorinated biphenyls
RMM = risk management measure

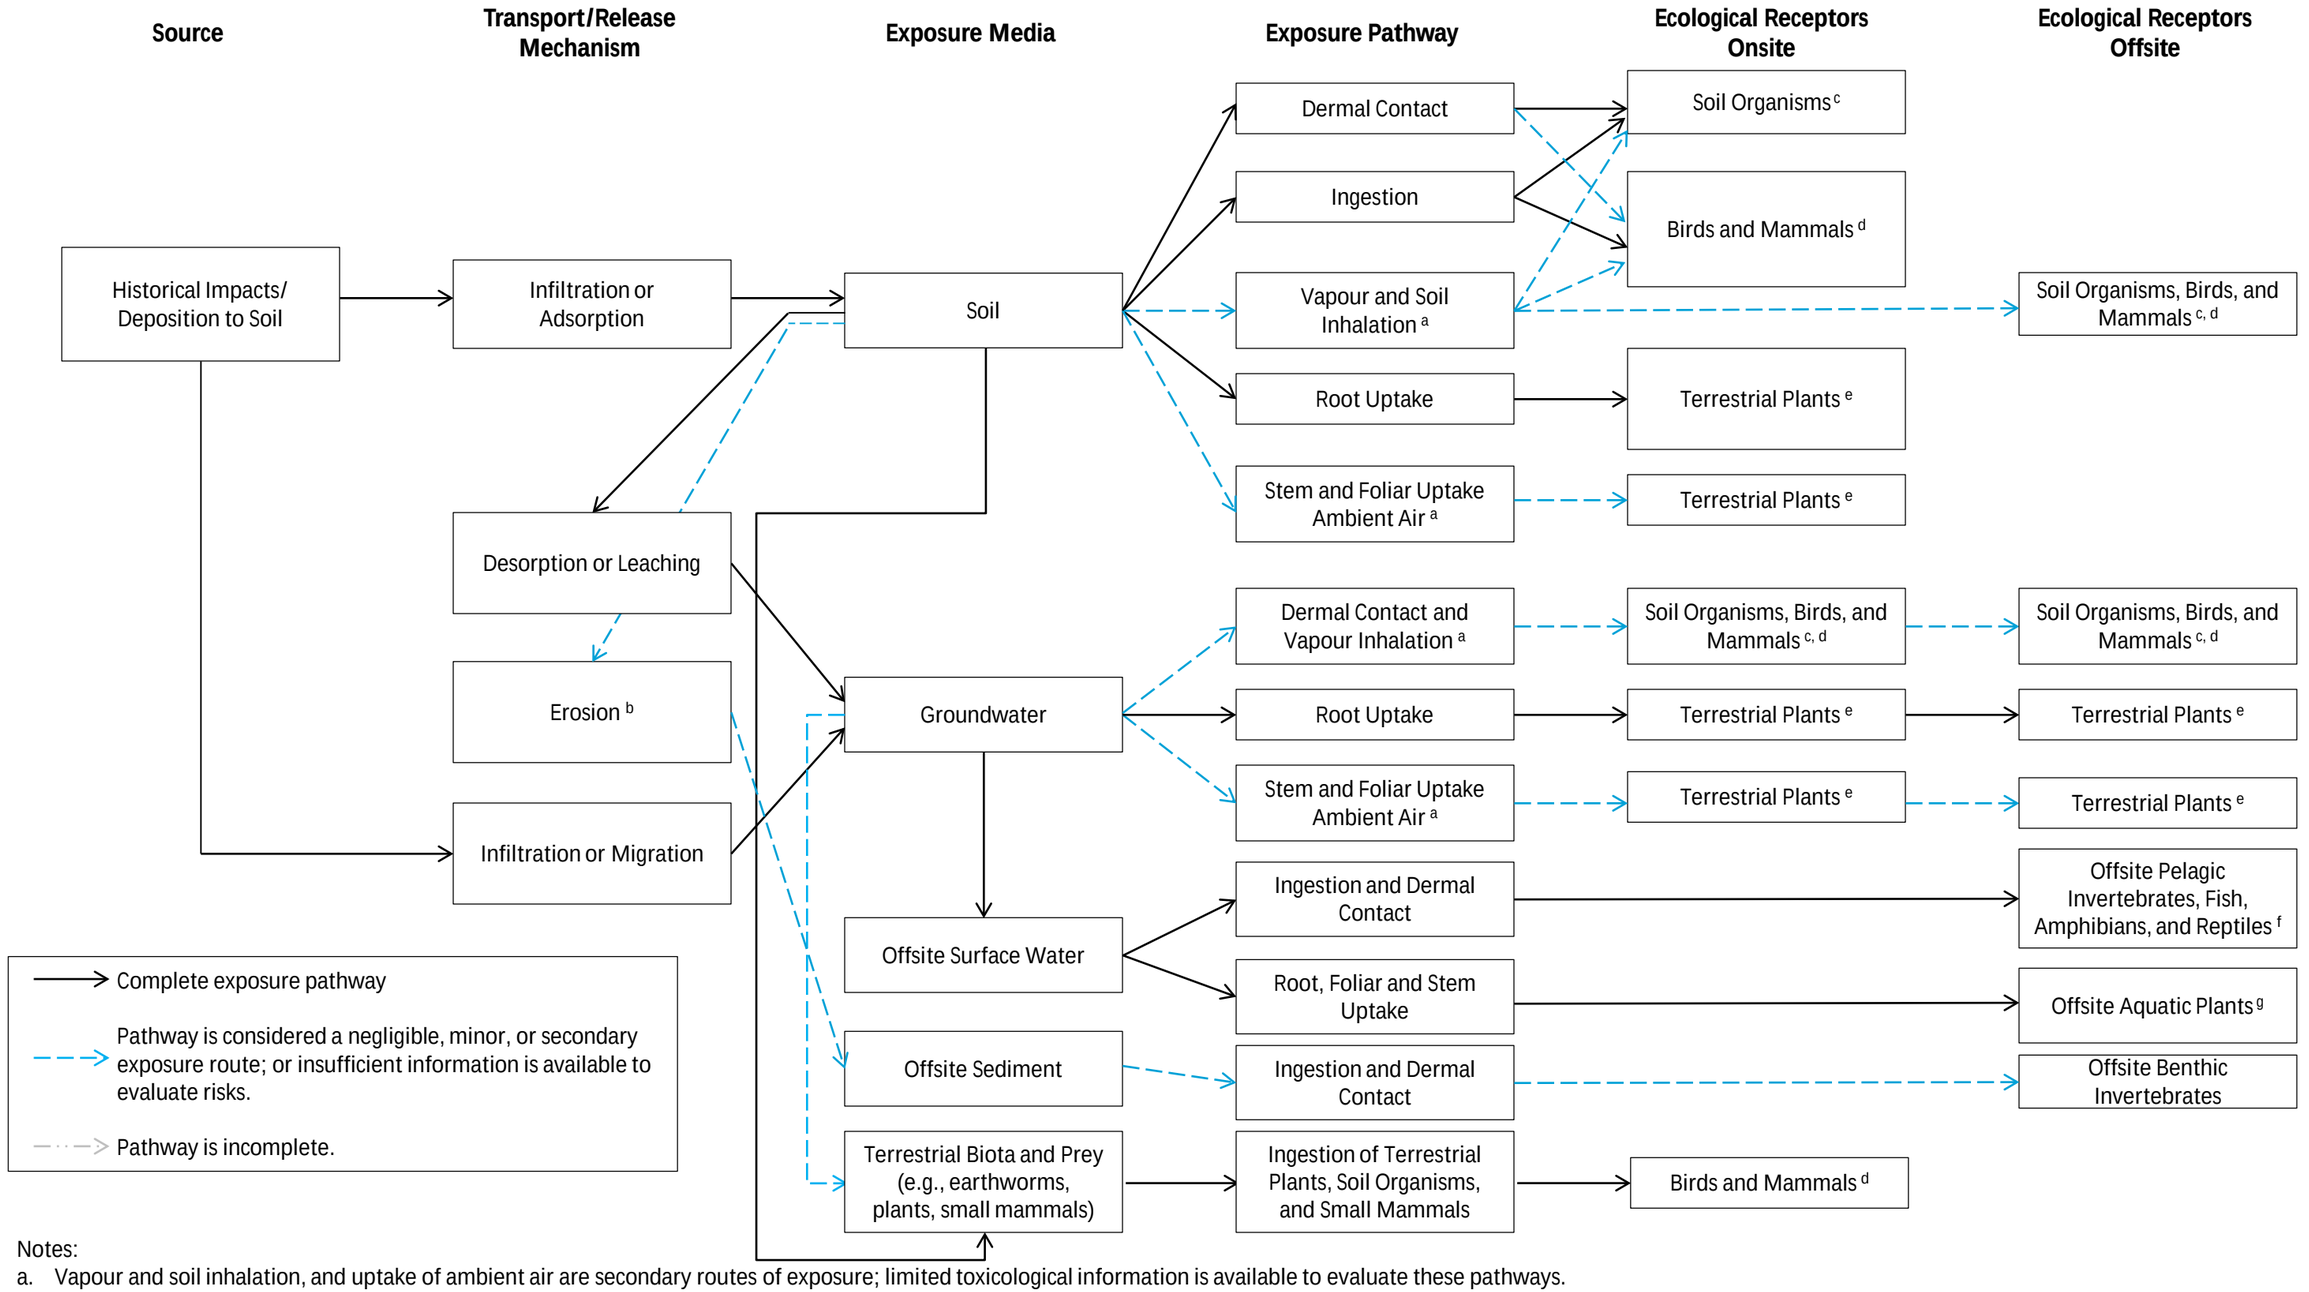
RMM = risk management measure

Figure E-2. Human Health Conceptual Site Model with Risk Management Measures
200 Beverley Street, Guelph, Ontario



Notes:

a. Vapour and soil inhalation, and uptake of ambient air are secondary routes of exposure; limited toxicological information is available to evaluate these pathways.
b. Pathway incomplete.
c. Selected VECs: Earthworms for soil organisms.
d. Selected VECs: American Woodcock, Red-winged Blackbird, and Red-tailed Hawk for birds; Meadow Vole, Red Fox, and Short-tailed Shrew for mammals.
e. Selected VECs: Grasses and Manitoba Maple for terrestrial plants.
f. Selected VECs: Daphnia for pelagic invertebrates; Emerald Shiner and Northern Pike for fish; Green Frog for amphibians; and Midland Painted Turtle for reptiles.
g. Selected VECs: *Carex spp.* for aquatic plants.

Toxicity Reference Values

Table F-1. Human Health Toxicity Reference Values

200 Beverley Street, Guelph, Ontario

Parameter	Toxicity Reference Value		Units	Effect/Basis	Study Population	Source	Originating Agency/Author	Candidate for Toxicity Profile [g]
Acenaphthene	RfD	6.0E-02	mg/kg/day	Hepatotoxicity.	Mice	MECP, 2011	EPA IRIS, 1994	No
	RfD Sub-chronic	6.0E-01	mg/kg/day	Increased liver weight.	Mice	MECP, 2011	ATSDR, 1995	No
	SF	1.0E-03	1/[mg/kg/day]	Alimentary tract tumours (forestomach, esophagus, tongue, and larynx). Kalberlah et al. TEF (0.001) employed, see Benzo[a]pyrene.	Mice	EPA IRIS, 2017	Kalberlah et. al., 1995; EPA IRIS, 2017	Yes, see Benzo(a)pyrene
	URF	6.0E-04	1/[mg/m^3]	Upper respiratory and upper digestive tract (forestomach) tumours. Kalberlah et al. TEF (0.001) employed, see Benzo[a]pyrene.	Hamsters	EPA IRIS, 2017	Kalberlah et. al., 1995; EPA IRIS, 2017	Yes, see Benzo(a)pyrene
Acenaphthylene	RfD	6.0E-02	mg/kg/day	Hepatotoxicity (surrogate values from acenaphthene). [e]	Mice	MECP, 2011	EPA IRIS, 1994	No
	RfD Sub-chronic	6.0E-01	mg/kg/day	Increased liver weight (surrogate value from acenaphthene). [e]	Mice	MECP, 2011	ATSDR, 1995	No
	SF	1.0E-02	1/[mg/kg/day]	Alimentary tract tumours (forestomach, esophagus, tongue, and larynx). Kalberlah et al. TEF (0.01) employed; see Benzo[a]pyrene.	Mice	EPA IRIS, 2017	Kalberlah et. al., 1995; EPA IRIS, 2017	Yes, see Benzo(a)pyrene
	URF	6.0E-03	1/[mg/^{3}]	Upper respiratory and upper digestive tract (forestomach) tumours. Kalberlah et al. TEF (0.01) employed, see Benzo[a]pyrene.	Hamsters	EPA IRIS, 2017	Kalberlah et. al., 1995; EPA IRIS, 2017	Yes, see Benzo(a)pyrene
Anthracene	RfD	3.0E-01	mg/kg/day	No observed effects.	Mice	MECP, 2011	EPA IRIS, 1990	No
	RfD Sub-chronic	3.0E+00	mg/kg/day	No observed effects.	Mice	MECP, 2011	EPA IRIS, 1990 (modified) a	No
	RfC	5.0E-02	mg/m^3	Body weight reduction, hepatic, renal, and developmental effects (surrogate value from C9 - C18 Aromatic Fraction). [d,e]	Rats	MADEP, 2004	TPHCWG, 1997	Yes
Antimony (Sb)	RfD	6.0E-03	mg/kg/day	Decreased body weight and food intake.	Rats	MECP, 2013a	WHO DW, 2003; RIVM, 2009	No
	RfC	2.0E-04	mg/m^3	Antimony trioxide-Pulmonary toxicity, and chronic interstitial inflammation.	Rats	MECP, 2011	EPA IRIS, 1995	No
Arsenic (As)	RfD	3.0E-04	mg/kg/day	Hyperpigmentation, keratosis, and possible vascular complications.	Humans	MECP, 2017a	EPA IRIS, 1991; ATSDR, 2007	No
	RfC	NA	mg/m^3	None Selected.	-	MECP, 2017a	-	No
	SF	9.5E+00	1/[mg/kg/day]	Lung cancer, multiple internal organ cancers (liver, kidney, lung, and bladder), skin cancer.	Humans	MECP, 2017a	-	No
	URF	1.5E-01	1/[mg/m^3]	Lung cancer.	Humans	MECP, 2017a	-	No
Benz[a]anthracene [c]	RfD	NA	mg/kg/day	None Selected.	-	-	-	No
	RfC	NA	mg/m^3	None Selected.	-	-	-	No
	SF	1.0E-01	1/[mg/kg/day]	Alimentary tract tumours (forestomach, esophagus, tongue, and larynx). Kalberlah et al. TEF (0.1) employed, see Benzo[a]pyrene.	Mice	EPA IRIS, 2017	Kalberlah et. al., 1995; EPA IRIS, 2017	Yes, see Benzo(a)pyrene
	URF	6.0E-02	1/[mg/m^3]	Upper respiratory and upper digestive tract (forestomach) tumours. Kalberlah et al. TEF (0.1) employed, see Benzo[a]pyrene.	Hamsters	EPA IRIS, 2017	Kalberlah et. al., 1995; EPA IRIS, 2017	Yes, see Benzo(a)pyrene

Table F-1. Human Health Toxicity Reference Values

200 Beverley Street, Guelph, Ontario

Parameter	Toxicity Reference Value		Units	Effect/Basis	Study Population	Source	Originating Agency/Author	Candidate for Toxicity Profile [g]
Benzene	RfD	5.0E-04	mg/kg/day	Decreased lymphocyte count.	Humans	ATSDR, 2007	-	Yes
	RfC	3.0E-02	mg/m^3	Decreased lymphocyte count.	Humans	MECP, 2011	EPA IRIS, 2003	No
	SF	8.3E-02	1/[mg/kg/day]	Malignant lymphomas (female mice); bone marrow hematopoietic hyperplasia (male mice)	Mice	HC, 2010	-	Yes
	URF	2.2E-03	$1/[mg/m^3]$	Leukemia.	Humans	MECP, 2011	EPA IRIS, 2000	No
Benzo[a]pyrene	RfD	3.0E-04	mg/kg/day	Neurobehavioural changes (developmental). [d]	Rats	EPA IRIS, 2017	-	Yes
	RfC	2.0E-06	mg/m^3	Decreased embryo/fetal survival (developmental). [d]	Rats	EPA IRIS, 2017	-	Yes
	SF	1.0E+00	1/[mg/kg/day]	Alimentary tract tumours (forestomach, esophagus, tongue, and larynx). Kalberlah et al. TEF (1) employed.	Mice	EPA IRIS, 2017	Kalberlah et. al., 1995; EPA IRIS, 2017	Yes
	URF	6.0E-01	$1/[mg/m^3]$	Upper respiratory and upper digestive tract (forestomach) tumours. Kalberlah et al. TEF (1) employed.	Hamsters	EPA IRIS, 2017	Kalberlah et. al., 1995; EPA IRIS, 2017	Yes
Benzo[b]fluoranthene [c]	RfD	NA	mg/kg/day	None Selected.	-	-	-	No
	RfC	NA	mg/m^3	None Selected.	-	-	-	No
	SF	1.0E-01	1/[mg/kg/day]	Alimentary tract tumours (forestomach, esophagus, tongue, and larynx). Kalberlah et al. TEF (0.1) employed, see Benzo[a]pyrene.	Mice	EPA IRIS, 2017	Kalberlah et. al., 1995; EPA IRIS, 2017	Yes, see Benzo(a)pyrene
	URF	6.0E-02	$1/[mg/m^3]$	Upper respiratory and upper digestive tract (forestomach) tumours. Kalberlah et al. TEF (0.1) employed, see Benzo[a]pyrene.	Hamsters	EPA IRIS, 2017	Kalberlah et. al., 1995; EPA IRIS, 2017	Yes, see Benzo(a)pyrene
Benzo[g,h,i]perylene [c]	RfD	NA	mg/kg/day	None Selected.	-	-	-	No
	RfC	NA	mg/m^3	None Selected.	-	-	-	No
	SF	1.0E-02	1/[mg/kg/day]	Alimentary tract tumours (forestomach, esophagus, tongue, and larynx). Kalberlah et al. TEF (0.01) employed; see Benzo[a]pyrene.	Mice	EPA IRIS, 2017	Kalberlah et. al., 1995; EPA IRIS, 2017	Yes, see Benzo(a)pyrene
	URF	6.0E-03	$1/[mg/m^3]$	Upper respiratory and upper digestive tract (forestomach) tumours. Kalberlah et al. TEF (0.01) employed, see Benzo[a]pyrene.	Hamsters	EPA IRIS, 2017	Kalberlah et. al., 1995; EPA IRIS, 2017	Yes, see Benzo(a)pyrene
Benzo[k]fluoranthene [c]	RfD	NA	mg/kg/day	None Selected.	-	-	-	No
	RfC	NA	mg/m^3	None Selected.	-	-	-	No
	SF	1.0E-01	1/[mg/kg/day]	Alimentary tract tumours (forestomach, esophagus, tongue, and larynx). Kalberlah et al. TEF (0.1) employed, see Benzo[a]pyrene.	Mice	EPA IRIS, 2017	Kalberlah et. al., 1995; EPA IRIS, 2017	Yes, see Benzo(a)pyrene
	URF	6.0E-02	$1/[mg/m^3]$	Upper respiratory and upper digestive tract (forestomach) tumours. Kalberlah et al. TEF (0.1) employed, see Benzo[a]pyrene.	Hamsters	EPA IRIS, 2017	Kalberlah et. al., 1995; EPA IRIS, 2017	Yes, see Benzo(a)pyrene
Cadmium	RfD	1.0E-04	mg/kg/day	Renal toxicity.	Humans	ATSDR, 2012	-	Yes
	RfC	1.0E-05	mg/m^3	Kidney toxicity.	Humans	ATSDR, 2012	-	Yes
	SF	NA	1/[mg/kg/day]	-	-	-	-	No
	URF	9.8E+00	$1/[mg/m^3]$	Lung carcinomas.	Rats	MECP, 2011	HC, 2010	No

Table F-1. Human Health Toxicity Reference Values

200 Beverley Street, Guelph, Ontario

Parameter	Toxicity Reference Value		Units	Effect/Basis	Study Population	Source	Originating Agency/Author	Candidate for Toxicity Profile [g]
Chrysene	RfD	NA	mg/kg/day	None Selected.	-	-	-	No
	RfC	NA	mg/m^3	None Selected.	-	-	-	No
	SF	1.0E-02	1/[mg/kg/day]	Alimentary tract tumours (forestomach, esophagus, tongue, and larynx). Kalberlah et al. TEF (0.01) employed; see Benzo[a]pyrene.	Mice	EPA IRIS, 2017	Kalberlah et. al., 1995; EPA IRIS, 2017	Yes, see Benzo(a)pyrene
	URF	6.0E-03	$1/[mg/m^3]$	Upper respiratory and upper digestive tract (forestomach) tumours. Kalberlah et al. TEF (0.01) employed; see Benzo[a]pyrene.	Hamsters	EPA IRIS, 2017	Kalberlah et. al., 1995; EPA IRIS, 2017	Yes, see Benzo(a)pyrene
Cobalt (Co)	RfD	1.0E-03	mg/kg/day	Polycythemia (proportion of blood volume that is occupied by red blood cells increased).	Humans	MECP, 2011	ATSDR, 2004	No
	RfD Sub-chronic	1.0E-02	mg/kg/day	Polycythemia (proportion of blood volume that is occupied by red blood cells increased).	Humans	MECP, 2011	ATSDR, 2004	No
	RfC	6.0E-06	mg/m^3	Decreased pulmonary function and respiratory tract irritation.	Humans	EPA PPRTV, 2008	-	Yes
	RfC Sub-chronic	2.0E-05	mg/m^3	Decreased pulmonary function and respiratory tract irritation.	Humans	EPA PPRTV, 2008	-	Yes
	URF	1.1E-07	$1/[mg/m^3]$	Lung adenoma or carcinoma.	Rats	EPA PPRTV, 2008	-	Yes
Copper (Cu)	RfD	1.0E-02	mg/kg/day	Gastrointestinal effects.	Humans	MECP, 2016e	ATSDR, 2004	No
	RfC	NA	mg/m^3	None Selected.	-	MECP, 2016e	-	No
Dibenz[a,h]anthracene [c]	RfD	NA	mg/kg/day	None Selected.	-	-	-	No
	RfC	NA	mg/m^3	None Selected.	-	-	-	No
	SF	1.0E+00	1/[mg/kg/day]	Alimentary tract tumours (forestomach, esophagus, tongue, and larynx). Kalberlah et al. TEF (1) employed; see Benzo[a]pyrene.	Mice	EPA IRIS, 2017	Kalberlah et. al., 1995; EPA IRIS, 2017	Yes, see Benzo(a)pyrene
	URF	6.0E-01	$1/[mg/m^3]$	Upper respiratory and upper digestive tract (forestomach) tumours. Kalberlah et al. TEF (1) employed; see Benzo[a]pyrene.	Hamsters	EPA IRIS, 2017	Kalberlah et. al., 1995; EPA IRIS, 2017	Yes, see Benzo(a)pyrene
Dichloroethane, 1,1-	RfD	2.0E-01	mg/kg/day	Renal toxicity.	Rats	EPA PPRTV, 2006	-	Yes
	RfD Sub-chronic	4.0E-01	mg/kg/day	Kidney damage (for example, increased serum creatinine and urea).	Cats	MECP, 2011	CalEPA DW, 2003	No
	RfC	1.7E-01	mg/m^3	Kidney damage (for example, increased serum creatinine and urea).	Cats	MECP, 2011	EPA HEAST, 1984	No
	SF	5.7E-03	1/[mg/kg/day]	Mammary gland adenocarcinomas.	Rats	CalEPA DW, 2003	-	Yes
	URF	1.6E-03	$1/[mg/m^3]$	Mammary gland adenocarcinomas.	Rats	CalEPA DW, 2003	-	Yes
Dichloroethylene, 1,1-	RfD	5.0E-02	mg/kg/day	Hepatic toxicity (fatty change).	Rats	MECP, 2016f	WHO CICAD, 2003; EPA IRIS, 2002	No
	RfC	2.0E-01	mg/m^3	Hepatic toxicity (fatty change).	Rats	MECP, 2016f	WHO CICAD, 2003; EPA IRIS, 2002	No
	RfC Sub-chronic	7.9E-02	mg/m^3	Hepatic effects (mottled livers).	Guinea Pigs	MECP, 2011	ATSDR, 1994	No
Dichloroethylene, cis-1,2- [f]	RfD	2.0E-03	mg/kg/day	Increased kidney and liver weights; decrease hematocrit.	Rats	MECP, 2016a	EPA IRIS, 2010	No
	RfD Sub-chronic	1.7E-02	mg/kg/day	Increased kidney and liver weights; decrease hematocrit.	Rats	MECP, 2016a	EPA PPRTV, 2011	No
	RfC	NA	mg/m^3	None Selected.	--	MECP, 2016a	-	No

Table F-1. Human Health Toxicity Reference Values
200 Beverley Street, Guelph, Ontario

Parameter	Toxicity Reference Value		Units	Effect/Basis	Study Population	Source	Originating Agency/Author	Candidate for Toxicity Profile [g]
Dichloroethylene, trans-1,2-	RfD	2.0E-02	mg/kg/day	Decrease in number of antibody forming cells.	Mice	MECP, 2016b	EPA IRIS, 2010	No
	RfD Sub-chronic	6.5E-02	mg/kg/day	Decrease in number of antibody forming cells.	Mice	MECP, 2016b	EPA IRIS, 2010 (modified) a	No
	RfC	6.0E-02	mg/m^3	Fatty degeneration of the liver lobules and Kupffer cells, and pulmonary hyperaemia, alveolar septal distension, and pneumonic infiltration.	Rats	MECP, 2016b	RIVM, 2001; MECP, 2011	No
	RfC Sub-chronic	7.9E-01	mg/m^3	Fatty degeneration of the liver.	Rats	MECP, 2011	ATSDR, 1996	No
Ethylbenzene	RfD	1.0E-01	mg/kg/day	Liver and kidney toxicity.	Rats	MECP, 2016d	EPA IRIS, 1987; RIVM, 2001; WHO DW, 2003; HC CSD, 2010	No
	RfD Sub-chronic	4.0E-01	mg/kg/day	Hepatotoxicity	Rats	MECP, 2016d	ATSDR, 2010	No
	RfC	1.9E+00	mg/m^3	Increased severity of nephropathy.	Rats	MECP, 2016d	TCEQ, 2010; CalEPA chREL, 2000	No
Fluoranthene	RfD	4.0E-02	mg/kg/day	Nephropathy, increased liver weights, hematological alterations, and clinical effects.	Mice	MECP, 2011	EPA IRIS, 1993	No
	RfD Sub-chronic	4.0E-01	mg/kg/day	Nephropathy, increased liver weights, hematological alterations, and clinical effects.	Mice	MECP, 2011	EPA IRIS, 1993 (modified) a	No
	SF	1.0E-02	1/[mg/kg/day]	Alimentary tract tumours (forestomach, esophagus, tongue, and larynx). Kalberlah et al. TEF (0.01) employed; see Benzo[a]pyrene.	Mice	EPA IRIS, 2017	Kalberlah et. al., 1995; EPA IRIS, 2017	Yes, see Benzo(a)pyrene
	URF	6.0E-03	$1/[mg/m^3]$	Upper respiratory and upper digestive tract (forestomach) tumours. Kalberlah et al. TEF (0.01) employed, see Benzo[a]pyrene.	Hamsters	EPA IRIS, 2017	Kalberlah et. al., 1995; EPA IRIS, 2017	Yes, see Benzo(a)pyrene
Fluorene	RfD	4.0E-02	mg/kg/day	Decreased red blood cell count, packed cell volume and hemoglobin.	Mice	MECP, 2011	EPA IRIS, 1990	No
	RfD Sub-chronic	4.0E-01	mg/kg/day	Decreased red blood cell count, packed cell volume and hemoglobin.	Mice	MECP, 2011	EPA IRIS, 1990 (modified) a	No
	RfC	5.0E-02	mg/m^3	CNS effects and increased liver and kidney weight.	Rats	MADEP, 2003	-	Yes
Indeno[1,2,3-cd]pyrene [c]	RfD	NA	mg/kg/day	None Selected.	-	-	-	No
	SF	1.0E-01	1/[mg/kg/day]	Alimentary tract tumours (forestomach, esophagus, tongue, and larynx). Kalberlah et al. TEF (0.1) employed, see Benzo[a]pyrene.	Mice	EPA IRIS, 2017	Kalberlah et. al., 1995; EPA IRIS, 2017	Yes, see Benzo(a)pyrene
	URF	6.0E-02	$1/[mg/m^3]$	Upper respiratory and upper digestive tract (forestomach) tumours. Kalberlah et al. TEF (0.1) employed, see Benzo[a]pyrene.	Hamsters	EPA IRIS, 2017	Kalberlah et. al., 1995; EPA IRIS, 2017	Yes, see Benzo(a)pyrene
Mercury (elemental)	RfD	1.6E-04	mg/kg/day	Increased kidney weight.	Rats	CalEPA DW, 1999	-	Yes
	RfD Sub-chronic	1.6E-03	mg/kg/day	Increased kidney weight.	Rats	CalEPA DW, 1999	-	Yes
	RfC	3.0E-04	mg/m^3	Impairment of neurobehavioral functions.	Humans	EPA IRIS, 1995	-	Yes
2-(1-)Methylnaphthalene	RfD	4.0E-03	mg/kg/day	Pulmonary alveolar proteinosis.	Mice	MECP, 2011	EPA IRIS, 2003	No
	RfC	5.0E-02	mg/m^3	CNS effects and increased liver and kidney weight.	Rats	MADEP, 2003	-	Yes
	SF	2.9E-02	1/[mg/kg/day]	Carcinogenic by mutagenic mode of action for lung adenomas and carcinomas. 1-Methylnaphthalene only.	Mice	EPA RSL, 2016	EPA PPRTV, 2008	Yes
Molybdenum	RfD	5.0E-03	mg/kg/day	Increased uric acid levels.	Humans	MECP, 2011	EPA IRIS, 1993	No
	RfC	1.2E-02	mg/m^3	Changes in body weight.	Mice, Rats	MECP, 2011	RIVM, 2001	No

Table F-1. Human Health Toxicity Reference Values

200 Beverley Street, Guelph, Ontario

Parameter	Toxicity Reference Value		Units	Effect/Basis	Study Population	Source	Originating Agency/Author	Candidate for Toxicity Profile [g]
Naphthalene	RfD	2.0E-02	mg/kg/day	Decreased mean terminal body weight.	Rats	MECP, 2011	EPA IRIS, 1998	No
	RfD Sub-chronic	2.0E-01	mg/kg/day	Decreased mean terminal body weight.	Rats	MECP, 2011	EPA IRIS, 1998 (modified) a	No
	RfC	3.7E-03	mg/m^3	Nasal effects: hyperplasia and metaplasia of respiratory and olfactory epithelium.	Mice	MECP, 2011	ATSDR, 2005	No
	URF	3.4E-02	$1/[mg/m^3]$	Carcinogenicity; respiratory epithelial adenoma and olfactory epithelial neuroblastoma of the nose.	Mice, Rats	EPA RSL, 2016	CalEPA ATH, 2009	Yes
n-Hexane	RfD	6.0E-02	mg/kg/day	Nervous system-neuropathy; Testicular atrophy.	Rats	EPA HEAST, 1997	-	Yes
	RfD Sub-chronic	6.0E-01	mg/kg/day	Nervous system-neuropathy; Testicular atrophy.	Rats	EPA HEAST, 1997	-	Yes
	RfC	7.0E-01	mg/m^3	Neurotoxic effects (functional impairment of the peripheral nervous system).	Rats	EPA IRIS, 2005	-	Yes
Nickel	RfD	2.8E-03	mg/kg/day	Reproductive and developmental effects (pre- and perinatal mortality). [d]	Rats	EFSA, 2015	-	No
	RfC	6.0E-05	mg/m^3	Lung fibrosis.	Rats	MECP, 2011	TERA, 1999	No
	URF	2.4E-01	$1/[mg/m^3]$	Lung and nasal cancers.	Humans	MECP, 2011	EPA IRIS, 1991; 2006	No
PHC F1 (C6-C10)								
Aliphatic (C6 - C8)	RfD	5.0E+00	mg/kg/day	Neurotoxicity.	Mice, Rats	MECP, 2011	TPHCWG, 1997; CCME, 2000	No
	RfC	1.8E+01	mg/m^3	Neurotoxicity.	Mice, Rats	MECP, 2011	TPHCWG, 1997; CCME, 2000	No
Aliphatic (C>8 - C10)	RfD	1.0E-01	mg/kg/day	Hepatic and hematological changes.	Rats	MECP, 2011	TPHCWG, 1997; CCME, 2000	No
	RfD Sub-chronic	1.0E+00	mg/kg/day	Hepatic and hematological changes.	Rats	MECP, 2011	TPHCWG, 1997; CCME, 2000	No
	RfC	1.0E+00	mg/m^3	Hepatic and hematological changes.	Rats	MECP, 2011	TPHCWG, 1997; CCME, 2000	No
Aromatic (C>8 - C10)	RfD	4.0E-02	mg/kg/day	Decreased body weight.	Mice, Rats	MECP, 2011	TPHCWG, 1997; CCME, 2000	No
	RfC	2.0E-01	mg/m^3	Decreased body weight.	Rats	MECP, 2011	TPHCWG, 1997; CCME, 2000	No
PHC F2 (C10-C16)								
Aliphatic (C>10 - C12)	RfD	1.0E-01	mg/kg/day	Hepatic and hematological changes.	Rats	MECP, 2011	TPHCWG, 1997; CCME, 2000	No
	RfD Sub-chronic	1.0E+00	mg/kg/day	Hepatic and hematological changes.	Rats	MECP, 2011	TPHCWG, 1997; CCME, 2000	No
	RfC	1.0E+00	mg/m^3	Hepatic and hematological changes.	Rats	MECP, 2011	TPHCWG, 1997; CCME, 2000	No
Aliphatic (C>12 - C16)	RfD	1.0E-01	mg/kg/day	Hepatic and hematological changes.	Rats	MECP, 2011	TPHCWG, 1997; CCME, 2000	No
	RfD Sub-chronic	1.0E+00	mg/kg/day	Hepatic and hematological changes.	Rats	MECP, 2011	TPHCWG, 1997; CCME, 2000	No
	RfC	1.0E+00	mg/m^3	Hepatic and hematological changes.	Rats	MECP, 2011	TPHCWG, 1997; CCME, 2000	No
Aromatic (C>10 - C12)	RfD	4.0E-02	mg/kg/day	Decreased body weight.	Mice, Rats	MECP, 2011	TPHCWG, 1997; CCME, 2000	No
	RfC	2.0E-01	mg/m^3	Decreased body weight.	Rats	MECP, 2011	TPHCWG, 1997; CCME, 2000	No
Aromatic (C>12 - C16)	RfD	4.0E-02	mg/kg/day	Decreased body weight.	Mice, Rats	MECP, 2011	TPHCWG, 1997; CCME, 2000	No
	RfC	2.0E-01	mg/m^3	Decreased body weight.	Rats	MECP, 2011	TPHCWG, 1997; CCME, 2000	No
PHC F3 (C16-C34)								
Aliphatic (C>16 - C21) [b]	RfD	2.0E+00	mg/kg/day	Hepatic (foreign body reaction) granuloma.	Mice	MECP, 2011	TPHCWG, 1997; CCME, 2000	No
	RfC	NA	mg/m^3	None Selected.	-	-	-	No
Aliphatic (C>21 - C34) [b]	RfD	2.0E+00	mg/kg/day	Hepatic (foreign body reaction) granuloma.	Mice	MECP, 2011	TPHCWG, 1997; CCME, 2000	No
	RfC	NA	mg/m^3	None Selected.	-	-	-	No
Aromatic (C>16 - C21) [b]	RfD	3.0E-02	mg/kg/day	Nephrotoxcity.	Mice	MECP, 2011	TPHCWG, 1997; CCME, 2000	No
	RfD Sub-chronic	3.0E-01	mg/kg/day	Nephrotoxcity.	Mice	MECP, 2011	TPHCWG, 1997; CCME, 2000	No
	RfC	NA	mg/m^3	None Selected.	-	-	-	No
Aromatic (C>21 - C34) [b]	RfD	3.0E-02	mg/kg/day	Nephrotoxcity.	Mice	MECP, 2011	TPHCWG, 1997; CCME, 2000	No
	RfD Sub-chronic	3.0E-01	mg/kg/day	Nephrotoxcity.	Mice	MECP, 2011	TPHCWG, 1997; CCME, 2000	No
	RfC	NA	mg/m^3	None Selected.	-	-	-	No

Table F-1. Human Health Toxicity Reference Values

200 Beverley Street, Guelph, Ontario

Parameter	Toxicity Reference Value		Units	Effect/Basis	Study Population	Source	Originating Agency/Author	Candidate for Toxicity Profile [g]
PHC F4 (C34-C50)/F4G-SG (GHH-Silica)								
Aliphatic (C>34) [b]	RfD	2.0E+01	mg/kg/day	Hepatic (foreign body reaction) granuloma.	Mice	MECP, 2011	TPHCWG, 1997; CCME, 2000	No
	RfC	NA	mg/m^3	None Selected.	-	-	-	No
Aromatic (C>34) [b]	RfD	3.0E-02	mg/kg/day	Nephrotoxcity.	Mice	MECP, 2011	TPHCWG, 1997; CCME, 2000	No
	RfD Sub-chronic	3.0E-01	mg/kg/day	Nephrotoxcity.	Mice	MECP, 2011	TPHCWG, 1997; CCME, 2000	No
	RfC	NA	mg/m^3	None Selected.	-	-	-	No
Phenanthrene	RfD	4.0E-02	mg/kg/day	Applicable to the non-carcinogenic C9 to C16 aromatic total petroleum hydrocarbon fraction (or its constituents) and is based on decreased body weight and increased liver and kidney weight.	Mice, Rats	RIVM, 2001	-	Yes
	RfC	5.0E-02	mg/m^3	CNS effects and increased liver and kidney weight.	Rats	MADEP, 2004	-	Yes
Polychlorinated Biphenyls	RfD	2.0E-05	mg/kg/day	Immunological effects.	Monkeys	MECP, 2011	ATSDR, 2000	No
	RfD Sub-chronic	3.0E-05	mg/kg/day	Neurobehavioral alterations.	Monkeys	MECP, 2011	ATSDR, 2000	No
	RfC	5.0E-04	mg/m^3	Hepatic effects and reduced body weight.	Rabbits, Rats	MECP, 2011	RIVM, 2001	No
	URF	1.0E-01	$1/[mg/m^3]$	Liver hepatocellular adenomas, carcinomas, cholangiomas, or cholangiocarcinomas.	Rats	MECP, 2011	EPA IRIS, 1997	No
Pyrene	RfD	3.0E-02	mg/kg/day	Kidney effects (renal tubular pathology, decreased kidney weights).	Mice	MECP, 2011	EPA IRIS, 1993	No
	RfD Sub-chronic	3.0E-01	mg/kg/day	Kidney effects (renal tubular pathology, decreased kidney weights).	Mice	MECP, 2011	EPA IRIS, 1993	No
	SF	1.0E-03	1/[mg/kg/day]	Alimentary tract tumours (forestomach, esophagus, tongue, and larynx). Kalberlah et al. TEF (0.001) employed, see Benzo[a]pyrene.	Mice	EPA IRIS, 2017	Kalberlah et. al., 1995; EPA IRIS, 2017	Yes, see Benzo(a)pyrene
	URF	6.0E-04	$1/[mg/m^3]$	Upper respiratory and upper digestive tract (forestomach) tumours. Kalberlah et al. TEF (0.001) employed, see Benzo[a]pyrene.	Hamsters	EPA IRIS, 2017	Kalberlah et. al., 1995; EPA IRIS, 2017	Yes, see Benzo(a)pyrene
Tetrachloroethylene	RfD	6.0E-03	mg/kg/day	Neurotoxicity - occupational exposures.	Humans	MECP, 2014a	EPA IRIS, 2012	No
	RfD Sub-chronic	1.4E-01	mg/kg/day	Effects on body weight gain, and ratio of liver or kidney weight to body weight.	Rats	MECP, 2014a	HC, 2010 (modified) [a]	No
	RfC	4.0E-02	mg/m^3	Neurotoxicity - occupational exposures.	Humans	MECP, 2014a	EPA IRIS, 2012	No
	RfC Sub-chronic	1.4E+00	mg/m^3	Neurotoxicity.	Humans	MECP, 2011	ATSDR, 1997	Yes
	SF	2.1E-03	1/[mg/kg/day]	Hepatocellular adenomas or carcinomas.	Mice	MECP, 2014a	EPA IRIS, 2012	No
	URF	2.6E-04	$1/[mg/m^3]$	Hepatocellular adenomas or carcinomas.	Mice	MECP, 2014a	EPA IRIS, 2012	No
Thallium	RfD	1.4E-05	mg/kg/day	Alopecia.	Rats	MECP, 2011	CalEPA DW, 1999	No
	RfD Sub-chronic	1.4E-04	mg/kg/day	Alopecia.	Rats	MECP, 2011	CalEPA DW, 1999 (modified) [a]	No
Trichloroethane, 1,1,1-	RfD	2.0E+00	mg/kg/day	Reduced body weight.	Mice	MECP, 2011	EPA IRIS, 2007	No
	RfD Sub-chronic	7.0E+00	mg/kg/day	Reduced body weight.	Mice	MECP, 2011	EPA IRIS, 2007	No
	RfC	5.0E+00	mg/m^3	Liver histopatholgical changes.	Rats	EPA IRIS, 2007	-	Yes
	RfC Sub-chronic	5.0E+00	mg/m^3	Liver histopatholgical changes.	Rats	EPA IRIS, 2007	-	Yes

Table F-1. Human Health Toxicity Reference Values

200 Beverley Street, Guelph, Ontario

Parameter	Toxicity Reference Value		Units	Effect/Basis	Study Population	Source	Originating Agency/Author	Candidate for Toxicity Profile [g]
Trichloroethylene	RfD	5.0E-04	mg/kg/day	Multiple: Developmental immunotoxicity, decreased thymus weights in mice, and heart malformations in rats. [d]	Mice, Rats	MECP, 2014b	EPA IRIS, 2011; ATSDR, 2013	No
	RfC	2.0E-03	mg/m^3	Multiple: Decreased thymus weights in mice and heart malformations in rats. [S]	Mice, Rats	MECP, 2014b	EPA IRIS, 2011; ATSDR, 2013	No
	SF	4.6E-02	1/[mg/kg/day]	Kidney, non-Hodgkin lymphoma, and liver cancers.	Humans, Mice	MECP, 2014b	EPA IRIS, 2011; ATSDR, 2013	No
	URF	4.1E-03	$1/[mg/m^3]$	Kidney, non-Hodgkin lymphoma, and liver cancers.	Humans, Mice	MECP, 2014b	EPA IRIS, 2011	No
Vanadium (V)	RfD	2.1E-03	mg/kg/day	Developmental effects in offspring. [d]	Rats	MECP, 2011	CalEPA DW, 2000	No
	RfD Sub-chronic	2.1E-03	mg/kg/day	Developmental effects in offspring. [d]	Rats	MECP, 2011	CalEPA DW, 2000	No
	RfC	1.0E-03	mg/m^3	Chronic upper respiratory tract symptoms.	Humans	MECP, 2011	WHO, 2000	No
Vinyl Chloride	RfD	3.0E-03	mg/kg/day	Liver cell polymorphism.	Rats	MECP, 2016c	ATSDR, 2006; EPA IRIS, 2000; MECP, 2011	No
	RfC	6.0E-02	mg/m^3	Liver cell polymorphism.	Rats	MECP, 2016c	TCEQ, 2009	No
	SF (continuous lifetime exposure from birth)	1.5E+00	1/[mg/kg/day]	Total of liver angiosarcoma, hepatocellular carcinoma, and neoplastic nodules.	Rats	MECP, 2016c	WHO DW, 2011	No
	SF (continuous lifetime exposure during adulthood)	7.2E-01	1/[mg/kg/day]	Total of liver angiosarcoma, hepatocellular carcinoma, and neoplastic nodules.	Rats	MECP, 2016c	EPA IRIS, 2000	No
	URF (continuous lifetime exposure from birth)	8.4E-03	$1/[mg/m^3]$	Liver angiosarcomas, angiomas, hepatomas, and neoplastic nodules.	Rats	MECP, 2016c	TCEQ, 2009	No
	URF (continuous lifetime exposure during adulthood)	4.4E-03	$1/[mg/m^3]$	Liver angiosarcomas, angiomas, hepatomas, and neoplastic nodules.	Rats	MECP, 2016c	EPA IRIS, 2000	No
Xylene Mixture	RfD	2.0E-01	mg/kg/day	Decreased body weight and increased mortality.	Rats	MECP, 2011	EPA IRIS, 2003	No
	RfD Sub-chronic	4.0E-01	mg/kg/day	Hyperactivity.	Mice	MECP, 2011	ATSDR, 2007	No
	RfC	7.0E-01	mg/m^3	CNS effects; and irritation of the eyes, nose, and throat.	Humans	MECP, 2011	CalEPA ChREL, 2005	No
	RfC Sub-chronic	2.6E+00	mg/m^3	Neurotoxicity.	Rats	MECP, 2011	ATSDR, 2007	No
Zinc	RfD	3.0E-01	mg/kg/day	Decreases in erythrocyte Cu, Zn-superoxide dismutase (ESOD) activity.	Humans	MECP, 2011	EPA IRIS, 2005	No
	RfC	1.4E-03	mg/m^3	Route-to-route extrapolation by MADEP.	-	MADEP, 2004	-	Yes

[a.] MECP derived toxicity values by modifying the proposed values in the cited source documents.

[b.] Chemical is not considered a concern for inhalation exposure and toxicity.

[c.] Noncancer TRV not available. Consistent with MECP (2011) Rationale Table.

[d.] Additional consideration for developmental effects required for this chemical and route of exposure.

[e.] Proxy or surrogate is chosen based on chemical's structural or functional similarity.

[f.] RfC for trans-1,2-dichloroethylene was used in the risk calculations as a surrogate in the absence of an MECP-selected TRV. RIVM (2009b) indicates that new genotoxicity studies conclude that "there is no clear evidence for differences in toxicity between the cis and the trans-isomer", therefore the use of the trans- isomer is an appropriate surrogate.

[g.] Toxicity Profiles to be provided in the risk assessment specific to the TRVs used in the RA following the secondary screening for human health.

The Corporation of the City of Guelph
1 Carden Street
Guelph, ON N1H 3A1

Attention: Prasoon Adhikari, Environmental Engineer

Re: Submission of Record of Site Condition – 200 Beverly Street, Guelph (also known as 200 Beverley Street, Guelph)

We understand that this letter will be part of the submissions to the Ministry of Environment, Conservation and Parks with respect to filing a Record of Site Condition for the lands described below, and to the extent and for that limited purpose, this letter can be read as also being addressed to the Ministry of Environment, Conservation and Parks for the purposes of such filing. We confirm the following:

1. **Legal Description**: PT LOT 1, 2, & 3, RANGE 3, DIVISION F, CITY OF GUELPH (FORMERLY TOWNSHIP OF GUELPH); PT BEVERLY ST, PLAN 343 , CLOSED BY DEP2184; AS IN RO706184 now described as Part 1, Reference Plan 61R-7850

2. **Registered Ownership**: The Corporation of the City of Guelph

3. **Assessment Roll**: 23 08 010 008 031 00

We trust that these confirmations will satisfy the requirements of submitting the Records of Site Condition.

Thank you.

Supporting Information

Table H-1. Species at Risk Occurrences within 1 km^2 of the RA Property

200 Beverly Street, Guelph, Ontario

Species (Common Name)	Species (*Latin Name*)	Preferred Habitat [a]	Ontario (S-Rank)	COSEWIC	MNRF Status/ SARO	Likelihood and Last Observation [b]
Plants						
Carey's Sedge	*Carex careyana*	Rich deciduous woods, wooded slopes and ravines.	S2	-	-	None, habitat not present. Last observed on June 8, 1905.
Invertebrates						
Giant Lacewing	*Polystoechotes punctatus*	Streamside vegetation, especially in woods.	SH	-	-	None, habitat not present. Last observed in August 1948.
Insects						
Painted Skimmer	*Libellula semifasciata*	Ponds and other still bodies of water, especially boggy ones with emergent plants, and often within forest.	S2	-	-	None, habitat not present. Last observed on May 26, 1913.
Reptiles						
Northern Map Turtle	*Graptemys geographica*	Areas of medium to large open water in lakes with emerging woody debris and abundant molluscs.	S3	SC	SC	None, habitat not present. Last observed in July 1924.
Eastern Milksnake	*Lampropeltis triangulum*	Open habitats such as rocky outcrops, fields and forest edge. The milksnake hibernates underground, in rotting logs or in the foundations of old buildings.	S3	SC	SC	None, while concrete foundations are present at the RA Property, other habitat requirements are not present. Last observed on September 28, 1978.
Eastern Ribbonsnake	*Thamnophis sauritus*	Wet meadows, marshes, seasonally flooded prairies, bogs, ponds, lake shorelines, swamps, and shallow slow streams; also, other wet or moist forest in some areas. Usually in or near vegetative cover in sun exposed sites along the edge of standing or flowing water.	S3	SC	SC	None, habitat not present. Last observed on April 25, 1990.

Risk Assessment Team Membership

Environmental Site Assessment

Ed Taves, M.Sc., C.Chem., QPESA, P.Geo. (Limited)

Ed Taves has over 31 years of professional experience in environmental consulting. He specializes in environmental due diligence assessments (Phase One and Two ESAs), site characterization, risk assessment, remedial option analysis, contaminant hydrogeology, facility decommissioning and brownfield redevelopment, and the preparation of Records of Site Condition (RSCs). Clients have included federal and provincial departments and ministries, municipal governments, and private industries, as well as members of the legal, financial, accounting, and land development communities. Projects have been completed for a wide variety of contaminants, including petroleum hydrocarbons, a variety of volatile organic compounds including chlorinated aliphatic hydrocarbons, metals, polychlorinated biphenyls, pesticides, nutrients, energetics, unexploded ordnance, chemical warfare agents, and radiologicals. Ed has fulfilled a number of roles, including project manager, task manager, senior technical consultant, and public and regulatory agency liaison.

Hydrogeology

Patricia Meyer, M.Sc, P.Geo.

Patricia (Patty) Meyer is a Senior Hydrogeologist with over 17 years of experience conducting water supply, contaminant transport, water budget, and watershed characterization assessments. Patty is an experienced groundwater flow modeller and has developed, calibrated or applied over 50 groundwater flow and contaminant transport models for sites located across North America, the United States and South America. She also is an experienced project manager and technical lead and has conducted groundwater vulnerability, environmental assessments, cumulative impact assessments, well head protection area delineation, and watershed-scale water budget studies across Ontario and beyond.

Jacqueline Brook, B.Sc., M.Sc.

Jacqueline Brook is an environmental scientist with a Master of Science from UW from the department of Earth Sciences. She is a groundwater specialist, with 7 years of experience as an environmental consultant completing project work involving water sampling, well testing, drilling, and the evaluation of soil hydraulic properties. She has extensive experience developing conceptual and numerical geological and groundwater models.

Human Health Risk Assessment

Katherine Appleby, B.E.S., E.P. (QPRA pending)

Katherine will be the QPRA for this RA. Her qualifications have been recently submitted to the MECP as part of another PSF submission (February 2019) for evaluation. Katherine has 13 years of experience in the field of RAs and ESAs. She has prepared numerous technical reports, including pre-submission forms (PSFs), screening-level risk assessments (SLRAs), and comprehensive RAs. Katherine has experience performing, reviewing, and supervising the completion of both HHRAs and ERAs for land- and water-based sites. Her skills include:

- Developing RA conceptual site models (CSMs)
- Selecting ecological and human health receptors
- Exposure modelling

- Selecting toxicity reference values (TRVs)
- Calculating risk estimates
- Developing risk management measures (RMMs)
- Reporting
- Performing peer review
- Responding to client and regulator comments on RA reports

Katherine has authored, led, or contributed to the completion of over 50 focused, comprehensive, or screening-level RA reports using both provincial (Ministry and Environment Yukon) and federal (Health Canada and Canadian Council of Minister of the Environment [CCME]) frameworks. She is familiar with provincial and federal environmental legislation, such as O. Reg. 153/04 (as amended) and the RSC filing process.

Krista Barfoot, Ph.D., C.Chem., QPRA – Senior Technical Resource

Dr. Krista Barfoot is an RA scientist with over 20 years of industry experience, including over 15 years of experience in risk assessment (RA) and vapour intrusion (VI) assessment. Beyond RA and VI work, Dr. Barfoot's technical expertise additionally extends to the management of excess soil, non-aqueous phase liquid (NAPL), risk mitigation measures, and stakeholder communication. She is the Ontario Environment Industry Association (ONEIA) Brownfield Committee Chair, an ONEIA Excess Soils Sub-Committee Member, and a Canadian Brownfields Network (CBN) Board Member. She is actively leading the development of the strategic approach for revitalizing several large, high-profile brownfield sites in Ontario.

Dr. Barfoot has examined aspects of both drinking water and groundwater contamination, industrial air contamination, and soil quality degradation, and has investigative experience in all three environmental mediums (water, air, and soil). Her graduate studies and work have spanned the fields of chemistry, toxicology, pedology, geology, agrology, and ecology, and recently extended into research related to emerging contaminants.

Brandi Wilson, B.Sc.

Brandi Wilson is an Environmental Scientist with 2 years of experience in the environmental consulting industry. Her areas of expertise include environmental assessments, including conducting HHRAs and Phase One ESAs; data entry and processing; writing technical memoranda; and performing field investigation activities, including sediment and groundwater sampling. She has prepared numerous technical reports, including PSFs, SLRAs, and comprehensive RAs. Her skills include developing exposure modelling, calculating risk estimates, reporting, and responding to client and regulator comments on RA reports. Brandi also has experience with stormwater management (SWM) pond sediment chemistry related disposal versus beneficial use evaluations.

Ecological Risk Assessment

Katherine Appleby, B.E.S., E.P. (QPRA pending)

Katherine will be the QPRA for this RA. Her qualifications have been recently submitted to the MECP as part of another PSF submission (February 2019) for evaluation. Katherine has 13 years of experience in the field of RAs and ESAs. She has prepared numerous technical reports, including pre-submission forms (PSFs), screening-level risk assessments (SLRAs), and comprehensive RAs. Katherine has experience performing, reviewing, and supervising the completion of both HHRAs and ERAs for land- and water-based sites. Her skills include:

- Developing RA conceptual site models (CSMs)
- Selecting ecological and human health receptors

- Exposure modelling
- Selecting toxicity reference values (TRVs)
- Calculating risk estimates
- Developing risk management measures (RMMs)
- Reporting
- Performing peer review
- Responding to client and regulator comments on RA reports

Katherine has authored, led, or contributed to the completion of over 50 focused, comprehensive, or screening-level RA reports using both provincial (Ministry and Environment Yukon) and federal (Health Canada and Canadian Council of Minister of the Environment [CCME]) frameworks. She is familiar with provincial and federal environmental legislation, such as O. Reg. 153/04 (as amended) and the RSC filing process.

James Kroetsch, B.Sc., M.Sc., F.W.T., EP, QP_{RA} – Senior Technical Resource

James Kroetsch has 29 years of experience in aquatic and terrestrial biology, with expertise in:

- Multidisciplinary environmental risk and impact assessment projects
- Environmental effects monitoring programs
- Site remediation studies
- Natural area inventories
- Fisheries compensation agreements
- Environmental management plans
- Watershed and habitat restoration studies
- Public consultation activities

He has applied his ecological skills on the municipal, provincial, national, and international levels for projects in the following sectors:

- Mining
- Planning and development
- Transportation
- Water management
- Aggregate
- Pulp and paper
- Petroleum
- Hydroelectric
- Nuclear power generation

He has performed, managed, and provided senior technical review for numerous ERAs under the MECP's O. Reg. 153/04 (as amended) process, as well as those following Canadian Council of Ministers of the Environment (CCME) and U.S. Environmental Protection Agency (USEPA) RA guidelines. These RAs have required field data investigations, ecological inventories, and monitoring. James has evaluated the fate, transport, and end point risks; and has developed and implemented numerous risk reduction strategies associated with exposure to:

- Metals
- Radionuclides
- Chlorinated and nonchlorinated VOCs
- PHCs
- PAHs
- Polychlorinated biphenyls (PCBs)

- Pesticides

He has also assisted in developing and implementing numerous risk reduction strategies. He is a registered QPRA for completing RAs under O. Reg. 153/04.

Nicole Pilgrim, M.Sc., P.Biol., R.P.Bio.

Nicole is a biologist with 6 years of experience in environmental consulting, and a total of 9 years of experience in biology in the academic, governmental, and industrial sectors. She is an aquatics project manager for linear development projects, and has extensive experience leading and coordinating aquatics projects. Nicole has led aquatic assessments throughout western Canada, describing and documenting fish habitat and using various methods of fish sampling. Nicole helps clients meet their regulatory requirements by writing technical reports, conducting desktop assessments, writing and filing regulatory applications, and providing regulatory advice. Nicole also has experience writing environmental and socioeconmic reports for water quality and quantity, fish and fish habitat, and physical and meteorological environment to determine residual and cumulative effects.

She also assists with human health and ecological RAs (HHERAs) on contaminated sites. Prior to Jacobs, Nicole worked on projects as an environmental monitor to confirm environmental compliance during construction, and completed fish and fish habitat assessments and tissue collections after a pipeline spill. She also has a M.Sc. in biology and specialized in aquatic toxicology.

Engineering

Wayne Cooley, B.A.Sc., P.Eng.

Wayne Cooley is a senior engineer with over 30 years of design and management experience in environmental and municipal engineering and construction. His primary expertise is in waste management, with an emphasis on landfill permitting, design, development, operation, closure, monitoring, and reporting. Additional significant experience consists of:

- Environmental site investigation and remediation
- Impervious linings
- Groundwater and leachate collection
- Pumping systems
- Stormwater management
- Municipal works

Wayne has extensive experience with planning and design issues, including the public consultation and approvals processes. Throughout his career, he has been extensively involved in both environmental and municipal construction works, providing a broad range of related services, such as tender and contract administration, construction inspection, and warranty administration. Wayne has successfully managed or completed a wide range of projects for public and private clients, and has liaised effectively with regulatory agencies to secure approvals.

Attention: Mr. Prasoon Adhikari

RE: **Ministry comments for the PSF for 200 Beverley Street, Guelph, Ontario, report prepared by CH2M Hill Canada Limited, dated February 2019 [PSF1748-19, IDS No. 6417-B9XQGZ].**

This letter will acknowledge receipt of the Pre Submission Form (PSF) submitted for the following Property under the Records of Site Condition Regulation (O. Reg. 153/04).

- **Pre-Submission Form for 200 Beverley Street, Guelph, Ontario, report prepared by CH2M Hill Canada Limited, dated February 2019**

The Ministry has reviewed the PSF submitted for the Property. Our reviewers offer comments, and questions in the attached Schedule A for the proponent's consideration in preparing a risk assessment for submission under the *Environmental Protection Act* (Act), Ontario Regulation 153/04 (Regulation), and associated guidance documents.

The outcome of this preliminary consultation is not binding on the risk assessment property owner or the Ministry, as the understanding of site conditions may develop and/or change during the course of the risk assessment. For this reason, the Ministry has the right to change its position. Ministry comments on the PSF do not in any way indicate acceptance of the final risk assessment approach or other conclusions of the risk assessment report and it does not indicate acceptance of the risk assessment report by the Director pursuant to s.168.5 of the Act.

If, at any time after submitting the PSF, the qualified person responsible for the preparation of the risk assessment changes or the property owner changes, the property owner shall give notice to the Director of the change in circumstance.

Four hard copies of the risk assessment, one marked original (along with a stand-alone electronic copy of the risk assessment [USB format]) are to be submitted to the Director of Client Services

and Permissions Branch for review under the Regulation and must include a copy of the PSF as well as a response in the risk assessment report outlining how the Ministry's concerns in Schedule A to this letter were addressed in the risk assessment.

Please note that a risk assessment under the Regulation does not deal with all potential approvals and issues associated with other Ministry legislation. Other regulatory and compliance tools are required to address other aspects of redevelopment of this property including:

- disposal of excess soil,
- potential for release of contaminants to the environment during remediation and construction activities,
- remedial activities which require Certificates of Approvals, and
- off-site impacts.

Off-site impacts, actual or likely, must be reported to the Ministry District Office forthwith. For your information the Act, Regulation, guidance documents and associated fact sheets have been posted to the following site:

https://www.ontario.ca/page/brownfields-redevelopment

Craig Kinch
Director, Environmental Protection Act s. 168.5

SCHEDULE A
To Director's Notice dated May 6, 2019

Comments by Ministry of Environment, Conservation and Parks On Pre-Submission Form

200 Beverley Street, Guelph, Ontario
PSF1748-19
(IDS Ref No. 6417-B9XQGZ)

The following are Ministry comments on the following Pre-Submission Form (PSF):

- **Pre-Submission Form for 200 Beverley Street, Guelph, Ontario, report prepared by CH2M Hill Canada Limited, dated February 2019**

Ministry reviewers offer comments, observations and questions, as follow, for the proponent's consideration in preparing a risk assessment for submission under the Records of Site Condition Regulation, O. Reg. 153/04 (Regulation).

Comments provided by the Ministry on the content of this Pre-Submission Form are not in any way a Director's response to a risk assessment referred to in subsection 168.5 of the EPA.

It also should be noted that a risk assessment submitted to the Ministry under the Regulation must include all mandatory requirements for risk assessments as listed in Table 1 of Schedule C of the Regulation. These requirements must be met or the risk assessment will be deemed incomplete and may be returned without further review.

It should also be noted that a risk assessment submitted to the Ministry under the Regulation must include a copy of the PSF as well as a response outlining how the comments in this Ministry review have been considered in the risk assessment.

The Regulation, guidance documents and associated fact sheets have been prepared to assist proponents. They can be found posted to the following site:

https://www.ontario.ca/page/brownfields-redevelopment

Timeline for Review of Risk Assessment

The proposed Risk Assessment (RA) will be a RA other than those identified in O. Reg. 153/04, Schedule C, Part II. Therefore, the review timeline for the RA will be set at 16 weeks. Section 46 of the Regulation provides specified maximum timelines for review of a RA by the Ministry. The Ministry's timeline for review of the RA under Section 46 of the Regulation will commence on receipt by the Ministry of a risk assessment in accordance with Section 2 of Schedule C of the Regulation.

COMMENTS ON PRE-SUBMISSION FORM

The following comments pertain to the Pre-Submission Form (PSF) for 200 Beverley Street, Guelph, Ontario, report prepared by CH2M Hill Canada Limited, dated February 2019

General Comments

The site is the former International Malleable Iron Company foundry facility with an approximate area of 5.2 ha. The foundry closed in 1989, and the site has been generally unoccupied since. The site is currently vacant with no onsite operations occurring. All former onsite buildings have been removed, with concrete floor slabs still in place. The proponent proposes to redevelop the site for a combination of one or more of residential, parkland, commercial, and community land uses.

Several technical issues and/or inconsistencies have been identified as described below that must be addressed in the risk assessment submission.

Specific Review Comments

Planned Risk Assessment Approach

1. The QP is reminded that while the Approved Model may be used as a tool in the conduct of the Tier 3 RA, it will not satisfy all of the mandatory requirements of a Tier 3 RA and not all of the assumptions of the Approved Model will necessarily be appropriate in the context of a Tier 3 RA. In addition, exposure pathways not addressed by the Approved Model require additional consideration in a Tier 3 RA (and should be evaluated either quantitatively or qualitatively).

Site Information

2. Section 3.2 – Neighbouring/adjacent property use to the west was indicated as residential; however, it appears to be a mixture of commercial/light industrial/residential. The RA submission should describe actual site usage in all areas, noting that zoning designations often include exemptions or may allow other permissible uses.

3. Section 3.3, Additional Project Information - It is indicated here and in Attachment A2 that free product has been observed and measured at the site (e.g., APECs 2, 5, and 10), and that analytical results suggest the potential for free product (e.g., APEC 11). The RA will need to fully describe the nature and extent of free product at the site and how it will be addressed. Free product on a site should be removed to the extent practicable.

4. Section 3.6 Contaminant Inventory – The following comments are provided:
    a. Tables D-1 and D-2, Summary of COC Screening in Soil – It appears that OTR values were used for screening of some parameters with no SCS. The QP should

provide references for the OTR values used (e.g., Rationale document, Soil Urban Parks, etc.) as the Reviewer was not able to find some of the referenced OTR values (e.g., OTR value of 17,400 ug/g for magnesium). In addition, no OTR value is available for some parameters (e.g., zirconium); however, it was indicated that the max concentration was lower than the OTR value. It is suggested that OTR values for all parameters that were screened out be provided with appropriate reference. It appears that the QP has used the CCME value for screening of tin in the absence of an MECP value; however, the CCME value is not shown in the table (Table D-1). The CCME value should be included in the table or RA text and rationale should be provided on why using this value is appropriate for the site. Similarly, it is suggested that the PGMIS values used for screening of groundwater parameters be included in Table D-2.

b. In addition, some of the notes under Table D-1 appear to be unrelated to this table and should be removed (e.g., DND, EXP).
c. Similarly, references to OTR values should be clarified in Table 6-7b in Appendix A2. It is noted that some parameters occur in Table 6-7b and not in Table D-1 and vice versa (e.g., zirconium in Table 6-7b but not D-1, and bismuth in D-1 but not 6-7b). These tables should be reviewed and corrected as required.
d. A stronger rationale should be provided for screening out of parameters with no SCS or available OTR values, including review of other sources of potential background concentration data and consideration of whether the chemical in question may be associated with historical site activities. Notably, bismuth concentrations may be elevated and this metal is known to be associated with specialty alloys.

<u>Human Health Risk Assessment</u>

5. Section 5.0 – The following comments are provided:
    a. Based on the HHCSM figures (Figures E-1 and E-2), a utility worker receptor is considered to be present at the Site. For future submissions, this receptor should be included in the HHCSM tables in Section 5.0 of the PSF for consistency.
    b. It is unclear how groundwater ingestion will be addressed by the RA. Figure E-1 refers to this as incidental ingestion, but includes consideration of construction and utility workers, as well as residents. It is unclear how residents would experience incidental exposures to groundwater. Further, since potable groundwater usage applies, the RA should consider this pathway as well and recommend appropriate risk management measures as required.

6. Attachment B - It is understood that vapour intrusion was not evaluated as part of the Phase Two ESA. The results of the P2ESA indicated that volatile COCs are present in soil and groundwater at concentrations greater than Table 6 SCS. It is understood that details regarding the design and locations of the future buildings are not known at this time. However, an assessment of potential vapour intrusion into future buildings should be completed in the RA and required RMMs (if needed) should be provided in the RMP. The Reviewer expects that this is the QP's intent, but the wording in this section is

ambiguous.

Ecological Risk Assessment

7. Attachment B, Contaminant Pathways and Receptors – The text in this section omits discussion of potential aquatic ecological exposure pathways, although they are referenced in the PSF per se and the Ecological CSM. The QP is encouraged to make use of the Approved Model in the evaluation of this issue.

CSPB Comments on Phase Two CSM

CSPB is currently reviewing the phase two CSM for this file. It is recommended that the QPESA follow up directly with CSPB regarding the status of the phase two CSM review; the CSPB contact is Rose Ash; email: rosemary.ash@ontario.ca

Summary and Conclusions

Several technical issues and/or inconsistencies have been identified as described above that must be addressed in the risk assessment submission.

Risk Management Measures (RMMs)

General Comments

- Based upon on review of the information provided with the Phase Two CSM, it does not appear that sufficient groundwater sampling has been completed at the time of submission in a number of monitoring well locations, specifically for VOCs and PHCs. As presented, it appears that several wells were only sampled once for these parameters. Please ensure that the RA includes all available data, in tabular format such that an interpretation to any potential trends can be made. If additional information is not available and additional groundwater sampling is not planned, additional groundwater monitoring will need to be considered in order to evaluate whether or not the groundwater contamination plume is increasing, decreasing or stable as well as to determine whether or not the maximum concentrations in groundwater have been reasonably identified.

- As the City of Guelph relies on groundwater for the municipal drinking water supply, both the Risk Assessment and the Phase Two CSM need to consider the potential impacts of COCs identified on the Property above the drinking water component value on the municipal supply. This evaluation needs to take into consideration the City's source water protection plan and make reference to available source water protection mapping.

Specific Review Comments

- Based upon what has been provided, the use of RMMs is anticipated by the QP. If RMMs are in fact found to be necessary as a result of the Risk Assessment, a certificate of property use will be required to be issued. Furthermore, if RMMs are required as part of this risk assessment, details on these measures will need to be included in the risk assessment report, including a clear description of the RMMs and/or any property restrictions; performance objectives; duration; and any maintenance and monitoring requirements along with contingency measures (if applicable).

Environmental Bill of Rights Requirements

For any Property Owner or their Agent with an interest in submitting a Risk Assessment to the Ministry for acceptance under the Environmental Protection Act s. 168.5 we want to bring to your attention important amendments under the Environmental Bill of Rights Act.

Ontario Regulation 681/94, Classification of Proposals for Instruments, under the Environmental Bill of Rights (EBR) has been amended to classify certificates of property use (CPUs) as a class II instrument under the EBR if the certificate of property use relates to a risk assessment submitted to the Ministry on or after October 1, 2005. This amendment was made through O. Reg. 505/05. This classification requires a minimum level of public notification (by the Ministry) prior to issuance of the CPU, including a posting on the EBR, of certificate of property use proposals, and provides third party leave to appeal a decision on a certificate of property use.

All decisions regarding a CPU are subject to the Environmental Bill of Rights (EBR). One purpose of the summary of the Risk Management Plan which must be provided in the Risk Assessment Report under the heading "Risk Management Requirements" is to support these requirements. This summary will allow the Ministry to prepare a notice for the EBR in a timely fashion so as not to delay the processing of the submission. The EBR posting allows public input regarding the pending decision of the Director to issue the CPU under Section 168.6 of the EPA.

The summary provided by the Qualified Person under the heading "Risk Management Requirements" will be posted. The Ministry reserves the right to change the wording of the description, as required, to ensure that the public is correctly notified of the subject of the application. The description should be simple and concise (typically under 100 words) and should include the following information:

- State the risk management measures (indicating the principle equipment and any proposed building or land use restrictions) and on-going monitoring, maintenance and contingency plan requirements.

The Regulation has been filed and can be viewed at e-laws:
https://www.ontario.ca/laws

SUBMISSION OF RISK ASSESSMENT

Submission of Risk Assessment

Four hard copies of the risk assessment (including a stand-alone electronic copy of the risk assessment [USB format]) should be delivered to:

The Director
Client Services and Permissions Branch
135 St. Clair Avenue West, 1st Floor
Toronto, ON, M4V 1P5
Telephone 416-314-8001

Of the four copies, at least one copy must contain the original signature of the QP_{RA} in the section on "mandatory certifications" as required by Section 5 of Schedule C of the Regulation. This original or master copy should be clearly labelled.

Change of Owner or QP_{RA}

Note that Section 3 (13) of Schedule C of the Regulation requires that the Director be notified in writing of a change of Property Owner, or change of QP_{RA}. It is requested that written notification of such a change be submitted to the Director at the above address and by email to the Risk Assessment Coordinator (address below). It is also requested that the notification include a copy of completed sections A, B, 1 and 10 of the Pre-Submission Form, completed and signed by all parties.

Risk Assessment

Many risk assessments fail because they do not satisfy basic requirements of the Regulation and/or because of misunderstandings about risk assessment processes under the Regulation. Before submitting a Risk Assessment to the Ministry, it is strongly recommended that the QP_{RA} review the mandatory requirements for risk assessments submitted under the Regulation, as outlined in **Sections 2, 4 and 5, and Table 1 of Schedule C of the Regulation**. As well, the QP_{RA} should refer to the Ministry's *Procedures for Use of Risk Assessment Under Part XV.1 of the Environmental Protection Act* for guidance in how to satisfy the requirements of the Regulation.

Use of Non-Standard Models

Please be advised that if the risk assessment submission uses a computer model as referred to in Schedule C, Section 9(4) and 9(5) of the Regulation, the Risk Assessment will be deemed a 'new science' risk assessment and the review timeline will be set at 22 weeks. Please note that the Qualified Person shall, upon request of the Director, include an electronic copy of the computer model in the risk assessment report in a manner that does not violate any person's copyright or other intellectual property rights.

Property Specific Standards

It is the responsibility of the QP_{RA} to ensure that the property specific standards (PSS) that are developed in the risk assessment (RA) will support filing of a Record of Site Condition (RSC) by the QP_{ESA}. This means that:

1) The correct table of site condition standards (SCS) must be used for selecting contaminants of concern (COC) in the risk assessment, and
2) PSS must be proposed for all COCs.
3) The QP_{RA} and QP_{ESA} must be able to make the requisite certifications in the RA/RSC.
4) Any parameters that do not have a PSS established in the RA must meet the applicable SCS.
5) If the QP_{ESA} finds that the RA does not support filing of the RSC (for example: the RA established PSS that are lower than concentrations found on-site; remediation has failed to reduce concentrations to below the PSS or applicable SCS), a new Pre-Submission Form (PFS) and RA must be submitted to the Ministry for review under the Regulation. RAs, once approved under the Regulation, cannot be 'reopened' or revised.

ESA Requirements and RSC Filing

Some of the comments included in this document (Schedule A) may be related to the adequacy of the environmental site assessment (ESA) work performed to support the approach and conclusions of the risk assessment (RA). Note that acceptance of the qualified person (QP's) responses on these ESA-related matters will be for the purpose of supporting a decision on the RA only; a full regulatory review of the ESAs will not be conducted as part of any future RA review. The Ministry may undertake a more in depth review of the phase one and phase two ESA reports at the time the record of site condition (RSC) is submitted for filing to ensure that all the regulatory requirements have been met. Information relevant to the phase one and two ESA reports (e.g., table of areas of environmental concern, the conceptual site models) that may be amended as part of the RA should be reflected in updated phase one and two ESA reports prior to submitting RSCs for filing. In addition, if the work on the phase one and two ESA exceeds 18 months prior to the submission date of the RSC, the phase one and two ESA reports will need to be updated prior to submitting RSCs for filing.

If the QP_{ESA} has any questions regarding meeting the ESA requirements at the time of RSC filing, it is suggested that they contact Rose Ash of Client Services and Permissions Branch;

email: rosemary.ash@ontario.ca

Questions

If the $QP_{(RA)}$ has questions regarding the application of the Regulation or the above comments, they should be forwarded by email to:

Ann-Marie Deonarine
Risk Assessment Review Coordinator
Technical Assessment and Standards Development Branch
ann-marie.deonarine@ontario.ca

APPENDIX A2

Response to PSF Comments in Schedule A for 200 Beverly Street, Guelph, Ontario

	May 8, 2019 MECP Comment	Jacobs Response	Document Location
1	The QP is reminded that while the Approved Model may be used as a tool in the conduct of the Tier 3 RA, it will not satisfy all of the mandatory requirements of a Tier 3 RA and not all of the assumptions of the Approved Model will necessarily be appropriate in the context of a Tier 3 RA. In addition, exposure pathways not addressed by the Approved Model require additional consideration in a Tier 3 RA (and should be evaluated either quantitatively or qualitatively).	Acknowledged.	--
2	Section 3.2 – Neighbouring/adjacent property use to the west was indicated as residential; however, it appears to be a mixture of commercial/light industrial/residential. The RA submission should describe actual site usage in all areas, noting that zoning designations often include exemptions or may allow other permissible uses.	Acknowledged. The description has been updated to include commercial and residential based on the observed site use in Section 3 of the RA text and in Appendix D3.	Section 3 Appendix D3
3	Section 3.3, Additional Project Information - It is indicated here and in Attachment A2 that free product has been observed and measured at the site (e.g., APECs 2, 5, and 10), and that analytical results suggest the potential for free product (e.g., APEC 11). The RA will need to fully describe the nature and extent of free product at the site and how it will be addressed. Free product on a site should be removed to the extent practicable.	Acknowledged. NAPL has been described in the CSM (Appendix D3) and in Sections 4, 5, and 6 of the RA. As the NAPL has been measured just at and below the overburden and bedrock contact in the eastern portion of the Site, removal options are limited. Soil impacts (PHCs) and NAPL have been observed within a monitoring well in an area previously remediated (soil excavation); it is likely that fluctuations of the water table have resulted in a smear zone, recontaminating the backfilled soil that was placed following the historical remediation. NAPL and groundwater monitoring at the property boundary is proposed to manage the NAPL onsite (Section 7).	Appendix D3 and Sections 4, 5 and 6
4	Section 3.6 Contaminant Inventory – The following comments are provided: a. Tables D-1 and D-2, Summary of COC Screening in Soil – It appears that OTR values were used for screening of some parameters with no SCS. The QP should provide references for the OTR values used (e.g., Rationale document, Soil Urban Parks, etc.) as the Reviewer was not able to find some of the referenced OTR values (e.g., OTR value of 17,400 ug/g for magnesium). In addition, no OTR value is available for some parameters (e.g., zirconium); however, it was indicated that the max concentration was lower than the OTR value. It is suggested that OTR values for all parameters that were screened out be provided with appropriate reference. It appears that the QP has used the CCME value for screening of tin in the absence of an MECP value; however, the CCME value is not shown in the table (Table D-1). The CCME value should be included in the table or RA text and rationale should be provided on why using this value is appropriate for the site. Similarly, it is suggested that the PGMIS values used for screening of groundwater parameters be included in Table D-2.	Acknowledged. Reference has been added to the Rationale Document (MECP, 2011) for the OTR values. OTR values from the Rationale Document are adjusted in accordance with the procedure the MECP employs in the calculation of the Table 1 Standards, as presented on the "Background Calculations" tab of the MGRA (2016). A footnote has been added to Table F1-1 (Table D-1 in the PSF). A reference to the CCME value for tin has been added, and the rationale updated to reflect this change. PGMIS values were applied to parameters as appropriate in Table F1-2 (Table D-2 of the PSF).	Appendix F1
	b. In addition, some of the notes under Table D-1 appear to be unrelated to this table and should be removed (e.g., DND, EXP).	Acknowledged. The notes in Table F1-1 (Table D-1 of the PSF) have been updated as applicable.	Appendix F1
	c. Similarly, references to OTR values should be clarified in Table 6-7b in Appendix A2. It is noted that some parameters occur in Table 6-7b and not in Table D-1 and vice versa (e.g., zirconium in Table 6-7b but not D-1, and bismuth in D-1 but not 6-7b). These tables should be reviewed and corrected as required.	Acknowledged. OTR and CCME references have been updated per comment 4a. Acknowledged. Table F1-1 (Table D-1 of the PSF) has been updated for consistency with Table 6-7b.	Appendix F1
	d. A stronger rationale should be provided for screening out of parameters with no SCS or available OTR values, including review of other sources of potential background concentration data and consideration of whether the chemical in question may be associated with historical site activities. Notably, bismuth concentrations may be elevated and this metal is known to be associated with specialty alloys.	Concentrations of parameters that do not have evidence of being associated with the Site or historical activities were not retained, specifically when the parameter or parameters were not targeted and only ran as a part of a full analytical scan by the analytical laboratory. Bismuth, specifically, was reviewed for another potential background concentration source and "the residential TRRP Tier 1 protective concentration level (PCL) (TCEQ,2017)" has a value of 37,000 ug/g which is much higher than the maximum reported concentration on Site of 150 ug/g. Refer to the rationale tables provided in Appendix D2 (soil and groundwater) and Appendix D3 (groundwater).	Appendix D2 Appendix D3
5	Section 5.0 – The following comments are provided: a. Based on the HHCSM figures (Figures E-1 and E-2), a utility worker receptor is considered to be present at the Site. For future submissions, this receptor should be included in the HHCSM tables in Section 5.0 of the PSF for consistency.	Acknowledged.	--

	May 8, 2019 MECP Comment	Jacobs Response	Document Location
	b. It is unclear how groundwater ingestion will be addressed by the RA. Figure E-1 refers to this as incidental ingestion, but includes consideration of construction and utility workers, as well as residents. It is unclear how residents would experience incidental exposures to groundwater. Further, since potable groundwater usage applies, the RA should consider this pathway as well and recommend appropriate risk management measures as required.	Acknowledged. The human health CSM figures have been updated to indicate ingestion of groundwater may occur by incidental ingestion for construction and utility workers, but also through ingestion of potable groundwater for residents.	Figures 4-1 and 4-2
6	Attachment B - It is understood that vapour intrusion was not evaluated as part of the Phase Two ESA. The results of the P2ESA indicated that volatile COCs are present in soil and groundwater at concentrations greater than Table 6 SCS. It is understood that details regarding the design and locations of the future buildings are not known at this time. However, an assessment of potential vapour intrusion into future buildings should be completed in the RA and required RMMs (if needed) should be provided in the RMP. The Reviewer expects that this is the QP's intent, but the wording in this section is ambiguous.	Acknowledged. Indoor air modelling for a generic residential and generic building scenario were completed as part of the RA. Modelling is presented in Appendix G2, and risk calculations and discussion are presented in Section 4.	Appendix G2 and Section 4
7	Attachment B, Contaminant Pathways and Receptors – The text in this section omits discussion of potential aquatic ecological exposure pathways, although they are referenced in the PSF per se and the Ecological CSM. The QP is encouraged to make use of the Approved Model in the evaluation of this issue.	Acknowledged. A qualitative assessment of the potential for offsite risks was completed for the potential offsite aquatic receptors employing the MECP MGRA Model to derive site-specific S-GW3 values based on the distance to the nearest downgradient water body. However, since the Site is a shallow soil property, use of the site-specific distance to the nearest waterbody does not result in a change to the GW3 values ("since one cannot assume that dilution occurs within the bedrock aquifer" [MECP, 2011]). Section 5.2.3 in the RA discusses the potential ecological aquatic receptors, while Section 5.5.3.2 includes a discussion on the potential pathway analysis.	Section 5.2.3 Section 5.5.3.2 Appendix F1, Tables F1-5a to F1-5e
8	Based upon on review of the information provided with the Phase Two CSM, it does not appear that sufficient groundwater sampling has been completed at the time of submission in a number of monitoring well locations, specifically for VOCs and PHCs. As presented, it appears that several wells were only sampled once for these parameters. Please ensure that the RA includes all available data, in tabular format such that an interpretation to any potential trends can be made. If additional information is not available and additional groundwater sampling is not planned, additional groundwater monitoring will need to be considered in order to evaluate whether or not the groundwater contamination plume is increasing, decreasing or stable as well as to determine whether or not the maximum concentrations in groundwater have been reasonably identified.	Acknowledged. A supplemental soil and groundwater investigation was completed between March and April of 2019; five existing wells were sampled and seven boreholes were advanced. Between February and March 2020, an additional soil and groundwater investigation was completed and 4 boreholes were advanced and 90 monitoring wells were sampled. In February 2020, 5 test pits were also advanced. The results of the additional soil and groundwater sampling are provided in Appendix D3. As a result, the screening tables (Table F1-1 and F1-2) were updated to reflect the additional soil and groundwater data. Appendix D3 provides the tabulated groundwater results in Table 6-8.	Section 3 Appendix D3, Table 6-8 Appendix F1, Tables F1-1 and F1-2
9	As the City of Guelph relies on groundwater for the municipal drinking water supply, both the Risk Assessment and the Phase Two CSM need to consider the potential impacts of COCs identified on the Property above the drinking water component value on the municipal supply. This evaluation needs to take into consideration the City's source water protection plan and make reference to available source water protection mapping.	Acknowledged. Reference to the source water protection mapping is provided in Appendix D3.	Appendix D3
10	Based upon what has been provided, the use of RMMs is anticipated by the QP. If RMMs are in fact found to be necessary as a result of the Risk Assessment, a certificate of property use will be required to be issued. Furthermore, if RMMs are required as part of this risk assessment, details on these measures will need to be included in the risk assessment report, including a clear description of the RMMs and/or any property restrictions; performance objectives; duration; and any maintenance and monitoring requirements along with contingency measures (if applicable).	Acknowledged.	--

Notes:

APEC = area of potential environmental concern
CCME = Canadian Council of Ministers of the Environment
City = City of Guelph
COC = contaminant of concern
CSM = conceptual site model
EcoCSM = ecological conceptual site model
ERA = Environmental Risk Assessment
ESA = Environmental Site Assessment
ha = hectare
HH = human health
km^2 = square kilometre
MGRA = Modified Generic Risk Assessment
MECP = Ontario Ministry of the Environment, Conservation and Parks
OTR = Ontario Typical Range
PGMIS = Provincial Groundwater Monitoring Information System
PHC = petroleum hydrocarbon
PSF = pre-submission form
P2 = Phase Two
QP = Qualified Person
RA = Risk Assessment
RSC = Record of Site Condition
RMM = risk management measure
RMP = risk management plan
SCS = site condition standard
VOC = volatile organic compound

Phase Two CSM Comments For:	PSF/RA Property Address: 200 Beverly St, Guelph PSF/RA File No.: PSF 1748-19 IDS No.: 6417-B9XQGZ Completed by: Client Services and Permissions Branch, Financial Assurance and Brownfields Services Unit Reviewer Name: Herb Maier, P.Geo.	October 10, 2019

These comments are based on the information provided in the phase two conceptual site model (CSM) in Attachment B of the Pre-Submission Form (PSF) dated February 2019.

General Comments:

1. According to the information presented in the phase two CSM there appear to a number of soil sampling locations within several areas of potential environmental concern (APECs) that have not been analyzed for the complete metals parameter group. In figures (plan view and cross-sections), sampling locations that have not been analyzed in accordance with the Regulation should be distinguished from sampling locations that have been analyzed in accordance with the Regulation. It is important to note that, although these sample results are useful, samples used for the assessment of APECs, delineation, confirmation sampling, etc. are to be collected and analyzed in accordance with the Protocol for Analytical Methods in the Assessment of Properties under Part XV.1 of the Environmental Protection Act", March 9, 2004, amended as of July 1, 2011. Additional sampling may be required to fill any resulting data gaps.

2. According to the description provided for APEC-11 there appear to have been historical impacts in this location (including free product), which do not appear to be shown in figures. Note that the locations and depths of any known historically impacted areas in this and in any other areas on the property and concentrations where contaminants previously exceeded the applicable site condition standard (SCS) need to be identified and shown in figures to demonstrate that areas where historical exceedances were present have been assessed in accordance with the regulatory requirements.

3. The title block in figures showing contaminant distribution contain a note that "J" indicates associated value is estimated"; however, no such samples were found in figures. Please note that data subject to qualifiers should be clearly highlighted in figures.

4. The reviewer was unable to locate Building 4H (Foundry Addition) on Figure 6-2 of phase one CSM. It is unclear whether this building is shown.

5. The phase two CSM needs to include a figure that shows potentially contaminating activity (PCA) locations and corresponding APECs. Where off-site PCAs exist that are not considered to contribute the APECs, then this figure should also distinguish between off-site PCAs that result in APECs from PCAs that do not (e.g., PCAs contributing to APECs could be highlighted red and PCAs that do not in green).

6. The phase two CSM acknowledges that the CSM has not been "finalized" and that further work is needed to confirm the applicable SCS (i.e., further work to determine representativeness of elevated pH in one sample location), assess APECs and delineate contaminants. Further submissions should ensure any data gaps identified by the QP and Ministry are appropriately addressed.

7. According to the phase two CSM, arsenic exceeded the applicable SCS in ground water in MW17-112S; however, this exceedance is not shown on figures. It is unclear if this is a typo and the if the qualified person (QP) is referring to MW18-112S.

8. It appears that the screened interval depths for MW18-135S and MW18-135D on Figure 6-15 (and possibly other figures) may be reversed.

Specific Comments of the Phase Two CSM:

9. Clause 33.1(2)(b) of the Regulation – The general objectives of the phase two environmental site assessment (ESA) are to be achieved by conducting one or more rounds of field sampling for all contaminants associated with any APEC identified in the phase two sampling and analysis plan and for any such contaminants identified during subsequent phase two activities and analyses of environmental conditions at the phase two property. The following issue was identified:

    - Based on the information presented in the phase two CSM, it is unclear if all APECs associated with the identified PCAs and/or potential sources of contamination have been investigated. For example:

        a) There do not appear to be any soil sampling locations for chlorophenols (CPs) in the central historical excavation area of APEC-1. There also do not appear to be any ground water sampling locations for CPs and acid/base/neutral compounds (ABNs) in the eastern portion of APEC-1. The description provided for APEC-1 refers to moulding sand and dust collector waste storage in the north west corner of the building and drained into the truck bay; however, these specific locations do not appear to be located and identified in figures in the phase two CSM.

        b) There does not appear to be adequate distribution of sampling of metals, petroleum hydrocarbons (PHCs) and volatile organic compounds (VOCs) in soil in APEC-3.

        c) There appears to be only one sample location for CPs in soil in APEC-4.

        d) There do not appear to be any soil sample locations for polycyclic aromatic hydrocarbons (PAHs) and VOCs and no ground water sample locations within the galvanizing room associated with APEC-5.

        e) There do not appear to be any soil and ground water sampling locations within the oil houses associated with APEC-7 and associated tanks are not shown and identified.

        f) The former underground storage tank (UST) associated with APEC-8 is not shown and identified.

        g) There do not appear to be any soil or ground water sampling locations within the oil house associated with APEC-9.

        h) It is unclear if there are any sampling locations in the location(s) where machine shop cuttings were stored on the ground north of the machine shop building associated with APEC-10 given that this area is not located and identified in figures in the phase two CSM.

i) It appears that the QP is relying on a single soil and ground water sampling location at the norther boundary of APEC-12. In addition, there appears to be additional coal storage east and outside of APEC-12.

j) There do not appear to be any soil sampling locations for PAHs and only one soil sample location for metals within the northern length of APEC-13.

k) There do not appear to be any ground water sampling locations for the identified contaminants of potential concern (COPCs) within the former building footprint associated with APEC-14.

l) There appears to be only a single soil sample location and no ground water sampling locations for the identified COPCs within the sand mixing/storage building associated with APEC-15 and only one soil sample location for CPs in APEC-15.

m) There do not appear to be any sampling locations for the identified COPCs in the central portion of APEC-16 where the transformer area appears to be located.

n) There do not appear to be any sample locations for PAHs within the coal storage building footprint or coal pile west of the coal storage building associated with APEC-18.

o) There do not appear to be any soil sampling locations for PHCs, PAHs and VOCs within the garage building footprint associated with APEC-20.

p) There do not appear to be any soil sampling locations for PAHs within the coal storage building footprint associated with APEC-21.

q) There do not appear to be any soil sampling locations for PHCs, VOCs and PAHs or ground water sampling locations within the paint shop building footprint associated with APEC-23.

r) There appear to be gaps in the assessment of PHCs, PAHs and VOCs in soil in the western, west-central and east-central portions and PHCs and PAHs in ground water in the west-central portion of the former drum storage area associated with APEC-25.

s) There do not appear to be any soil or ground water sampling locations for the identified COPCs within the electrical shop associated with APEC-27.

t) The description for APEC-29 associated with fill material of unknown quality also refers to oiling of exterior yard areas for dust control. Oiling of yard areas should be identified as a separate APEC(s) and yard areas where oil was applied should be clearly shown and identified in figures to demonstrate that these area(s) where oil was applied have been adequately assessed.

Note that identifying and locating where any PCA and/or potential sources of contamination have occurred and showing tanks in such areas is required in the phase one CSM and on figures showing the property before actions taken to reduce the

concentration of contaminants in the phase two ESA. The phase two CSM must demonstrate that samples have been collected and analyzed from areas where maximum concentrations are expected and that the distribution of samples within each APEC is representative of the full extent of each APEC.

10. Subsection 7(1) and 16 of Schedule E – The QP shall ensure that all areas on, in or under the phase two property where a contaminant is present at a concentration greater than the applicable SCS for the contaminant shall be delineated laterally and vertically for each contaminant present in soil, ground water or sediment, on, in or under the phase two property. In addition, section 16 specifies additional characterization requirements for when analysis shows that the contaminant is present at a concentration greater than the applicable SCS. The following issues were identified:

    - There appears to be a gap in the lateral delineation of benzene, toluene, ethylbenzene, xylenes (BTEX) in soil in BH07-66.
    - There do not appear to be any deeper ground water sampling locations to vertically delineate benzene in ground water in MW17-102D nor do there appear to be up/cross-gradient samples at laterally delineate at similar depth.
    - Trichloroethylene (TCE) is reported as exceeding the applicable SCS in MW18-113D; however, it is unclear if TCE has been vertically delineated in this area. It is further noted here that there do not appear to be any shallower ground water sampling for VOCs in this area.
    - There appears to be a general gap in the delineation of VOCs in the northwestern portion of the property.
    - BTEX in soil exceeded the applicable SCS in BH07-66 at the overburden-bedrock interface; however, no ground water sampling appears to have been conducted at this location.
    - There do not appear to be any ground water sampling locations for PHCs in the vicinity of MW18-117S and BH07-60 in the northwestern portion of the property where PHCs exceeded the applicable SCS in soil.
    - It is acknowledged that further lateral and vertical delineation of VOCs in soil will be undertaken.

    The QP will be required to delineate the lateral and vertical extent of these contaminants in soil and in ground water by conducting further phase two investigation activities.

11. Section 43 and Table 1, Report Section 6, Sub-Heading (x) of Schedule E – The phase two CSM submitted with the RSC is required to demonstrate the current condition of the phase two property or, where remedial actions have been undertaken, the condition of the phase two property before the remedial actions were undertaken. The following information is missing from the phase two CSM:

- A narrative description of, and, as appropriate, figures illustrating the physical setting of the phase two property and any areas under it including:

    a. Hydrogeological characteristics, including aquifers, aquitards and, in each hydrostratigraphic unit where one or more contaminants are present at concentrations above the applicable SCSs, lateral and vertical hydraulic gradients. The magnitude of the downward and upward hydraulic gradients should be provided.

    b. Any respect in which section 41 or 43.1 of the Regulation applies to the property. This section of the phase two CSM should include an evaluation of presence/absence of areas of natural significance.

- Where a contaminant is present on, in or under the phase two property at a concentration greater than the applicable SCS, identification of:

    i. The distribution, in each of the areas where a contaminant is present on, in or under the phase two property at a concentration greater than the applicable SCS, of each contaminant present in the area at a concentration greater than the applicable SCS, for each medium in which the contaminant is present, together with figures showing the distribution. A narrative description of lateral and vertical distribution of BTEX in ground water in MW17-102D appears to be missing from the phase two CSM.

- The title of Figure 6-4 of the phase two CSM refers to "inorganics". Please note that all contaminants should be identified using the Method Groups as identified in the "Protocol for Analytical Methods in the Assessment of Properties under Part XV.1 of the Environmental Protection Act", March 9, 2004, amended as of July 1, 2011, which are also listed in footnote number 3 of the approved APEC table form.

- The phase two CSM should provide confirmation that maximum concentration of cis-1,2-dichloroethene (cis-1,2-DCE) in ground water under the property have been located and identified.

- Based on figures in the phase two CSM there appear to be a number of ground water sampling locations that exceeded the applicable SCS and subsequently met the applicable and are highlighted as meeting the applicable SCS; however, no further explanation for each is provided. It is unclear what the rationale is for why these ground water sample locations are considered to meet the applicable SCS. For example:

    i. Antimony is identified on Figure 6-12 as having initially exceeded the applicable SCS in ground water in MW118-114D and then subsequently meeting the applicable SCS, but is highlighted as meeting the applicable SCS. Similarly, lead is reported as having exceeded the applicable SCS in ground water in OW07-33 and subsequently meeting the applicable SCS in two subsequent sampling events, but highlighted as meeting the applicable SCS. Similar issues were identified for zinc in ground water in OW12 and OW26S and arsenic in ground water in MW17-101D. However, no explanations are provided in the CSM.

ii. Benzene is identified on Figure 6-14 as having exceeded the applicable SCS in ground water in MW18-112G and subsequently meeting the applicable SCS and is highlighted as meeting the applicable SCS; however, no explanation is provided.

iii. PHC F2 is identified on Figure 6-15 as having exceeded the applicable SCS in ground water in OW18-II and subsequently meeting the applicable SCS and is highlighted as meeting the applicable SCS; however, no explanation is provided.

iv. Polychlorinated biphenyls (PCBs) are identified as having previously exceeded the applicable SCS in ground water in OW26S in 2010 and subsequently meeting the applicable SCS in 2011 and 2017 at this location.

If an initial sampling result that is greater than the applicable SCS is considered to be non-representative, a rationale for why should be provided and where there has been only a single subsequent sampling event, at least one additional round of ground water sampling should be conducted to confirm. If the initial exceedance is representative of site conditions (e.g., true/real exceedance), then delineation would be required.

- The lateral and/or vertical distribution of contaminants in cross-sections on Figures 6-3c, 6-5a, 6-5b, 6-6a, 6-6c, 6-6d, 6-7a, 6-7b, 6-8a, 6-10a, 6-10b, 6-12a, 6-14c, 6-14d and 6-17a did not follow the requirements of clause 7(4)(c), Schedule E, which states the following:

  "the delineation is conducted by assuming the lateral and vertical extent of the area in which a contaminant is present at a concentration greater than the applicable SCS for that contaminant extends laterally or vertically, as the case may be, from a sampling location at which the contaminant is present at a concentration greater than the applicable SCS for the contaminant to the next sampling location at which the concentration of the contaminant is equal to or below the applicable SCS for the contaminant".

- The screened interval of monitoring wells should clearly identified on cross-sections showing the lateral and vertical distribution of contaminants.

12. Subsection 47(15) of Schedule E – Figures, maps, site plans and cross-sections are required to contain a scale, north arrow and a title block that includes a descriptive title, the address of the phase two property, if any, the name of the QP's firm, company or partnership, if any; and the date the figure, map, site plan or cross-section was created. The following issues were identified:

    - The figures are marked "Draft", indicate that "Locations are approximate" and the title block is missing the date the figure was created.

APPENDIX A2

Response to Phase Two Conceptual Site Model Comments for 200 Beverley Street, Guelph, Ontario

October 10, 2019 MECP Comment	Jacobs Response
General Comments	
1. According to the information presented in the phase two CSM there appear to a number of soil sampling locations within several areas of potential environmental concern (APECs) that have not been analyzed for the complete metals parameter group. In figures (plan view and cross- sections), sampling locations that have not been analyzed in accordance with the Regulation should be distinguished from sampling locations that have been analyzed in accordance with the Regulation. It is important to note that, although these sample results are useful, samples used for the assessment of APECs, delineation, confirmation sampling, etc. are to be collected and analyzed in accordance with the Protocol for Analytical Methods in the Assessment of Properties under Part XV.1 of the Environmental Protection Act", March 9, 2004, amended as of July 1, 2011. Additional sampling may be required to fill any resulting data gaps.	Metals analysis from historical samples were used to supplement the more recent Phase Two ESA investigations. Metals analysis were done in accordance with the regulations at the time which result in arsenic, boron, and uranium typically missing from metals analyses from samples collected in the 1990s (54 samples at 43 locations), and boron and uranium typically missing from metals analyses from 2007 (77 samples from 36 locations). These soil sampling locations (79 locations) make up roughly 50 percent of the total 158 soil sampling locations for metals. All APECs which include Metals as COPCs have been characterized with at least one soil sample from the recent sampling events which have been collected and analyzed in accordance with O. Reg. 153/04. The sampling locations in each APEC are shown in the disposition table provided as Table 6-4 of the CSM. This is a total of 91 samples from 55 locations. Historical Metals therefore only supplement data for characterization and provide more dense coverage with 79 additional sample locations. As with the nature of fill in industrial locations, the horizontal and vertical extent of contaminants present is essentially across the full site, to the full depth of soils present (ie. to bedrock, which is on average 2.5 mbgs at the Site) and therefore historical samples are rarely used for delineation. The only area where clean historical soils are used for delineation is a limited area across the northwestern boundary of the property, where limited industrial activity has occurred. We believe the historical data is still valid and useful for the following reasons: - no industrial activity has happened since the time of sampling and metals remain fairly stable in soil; - many maximum concentrations (9 of 11 locations) are from historical locations, and are included to have a conservative dataset; resampling to find the maximums in current programs would be impractical - sampling analysis was done by an accredited lab in accordance with the regulations at the time; - the parameters that are missing, aside from arsenic in the 1990s samples, have not been determined to be COPCs based on the APEC descriptions, nor as COCs from the results of the remaining 91 samples. Boron and uranium are detected at a maximum of half or less of their respective SCS. Where arsenic occurs in concentrations above the SCS (3 of 165 samples), the extent has been delineated with samples analyzed for metals including arsenic.
2. According to the description provided for APEC-11 there appear to have been historical impacts in this location (including free product), which do not appear to be shown in figures. Note that the locations and depths of any known historically impacted areas in this and in any other areas on the property and concentrations where contaminants previously exceeded the applicable site condition standard (SCS) need to be identified and shown in figures to demonstrate that areas where historical exceedances were present have been assessed in accordance with the regulatory requirements.	As this excavation occurred in 1999, confirmatory sampling (i.e. samples collected for TPH, lead and zinc only) and documentation of the soil removal was not conducted as per the current regulatory requirements. Therefore, Jacobs did not intend to use or report this data in similar ways to any current remediation as there were data reliability issues for those historical exceedances. Instead, Jacobs used the historical data for screening purposes to develop the Phase Two ESA sampling programs, and the area and APEC has been characterized and delineated with subsequent sampling meeting the current regulatory requirements. We discuss the use and reliability of all historical data in Section 3.3.1 of the RA as well as within the Phase Two ESA (in draft) and generally state that the VOC and TPH parameters prior to 2004 are considered unreliable due to changes in analytical methods and have been replaced with more appropriate analyses. Additionally, we have not relied on historical data from reports that did not include laboratory certificates of analysis. COCs that were targeted during the 1999 excavation (TPH, Lead and Zinc) remain as COCs on the Site. Most of the excavated area is still included in the impacted areas defined by the horizontal and vertical delineation as shown on the CSM figures (metals and PHCs in both soil and groundwater), with the exception of a small area to the north where current sampling has characterized the PHCs in soil and groundwater to be below the SCS.
3. The title block in figures showing contaminant distribution contain a note that "J" indicates associated value is estimated"; however, no such samples were found in figures. Please note that data subject to qualifiers should be clearly highlighted in figures.	The J qualifier was missing on applicable data from previous figures and has been updated where applicable.
4. The reviewer was unable to locate Building 4H (Foundry Addition) on Figure 6-2 of phase one CSM. It is unclear whether this building is shown.	Building 4H on the inset table on Figure 6-2 was an error which was corrected in the Phase One ESA and mistakenly carried through to the CSM. The figure has been updated with the corrected table. One building was missing labels (6A) and was also added in the revised Figure 6-2.
5. The phase two CSM needs to include a figure that shows potentially contaminating activity (PCA) locations and corresponding APECs. Where off-site PCAs exist that are not considered to contribute the APECs, then this figure should also distinguish between off-site PCAs that result in APECs from PCAs that do not (e.g., PCAs contributing to APECs could be highlighted red and PCAs that do not in green).	Figures 4-1a and 4-1b have been included to show off-site and onsite PCAs and corresponding APECs.
6. The phase two CSM acknowledges that the CSM has not been "finalized" and that further work is needed to confirm the applicable SCS (i.e., further work to determine representativeness of elevated pH in one sample location), assess APECs and delineate contaminants. Further submissions should ensure any data gaps identified by the QP and Ministry are appropriately addressed.	Acknowledged. The subsequent submission of the CSM has all data gaps addressed.

October 10, 2019 MECP Comment	Jacobs Response
7. According to the phase two CSM, arsenic exceeded the applicable SCS in ground water in MW17- 112S; however, this exceedance is not shown on figures. It is unclear if this is a typo and the if the qualified person (QP) is referring to MW18-112S.	Arsenic exceeded the applicable SCS in MW18-112S. This was a typo and text has been corrected.
8. It appears that the screened interval depths for MW18-135S and MW18-135D on Figure 6-15 (and possibly other figures) may be reversed.	The screen depth information was reversed in the project database in error and has been corrected. The figures have been regenerated using the updated database information.
Specific Comments of the Phase Two CSM:	
9. Clause 33.1(2)(b) of the Regulation – The general objectives of the phase two environmental site assessment (ESA) are to be achieved by conducting one or more rounds of field sampling for all contaminants associated with any APEC identified in the phase two sampling and analysis plan and for any such contaminants identified during subsequent phase two activities and analyses of environmental conditions at the phase two property. The following issue was identified:	
• Based on the information presented in the phase two CSM, it is unclear if all APECs associated with the identified PCAs and/or potential sources of contamination have been investigated. For example:	
a) There do not appear to be any soil sampling locations for chlorophenols (CPs) in the central historical excavation area of APEC-1. There also do not appear to be any ground water sampling locations for CPs and acid/base/neutral compounds (ABNs) in the eastern portion of APEC-1. The description provided for APEC-1 refers to moulding sand and dust collector waste storage in the north west corner of the building and drained into the truck bay; however, these specific locations do not appear to be located and identified in figures in the phase two CSM.	The QPs basis for the frequency and placement of sampling for CPs was based on a site-wide approach in addition to the assessment of individual APECs. As the potential for ABNs and CPs on site would be associated with spent foundry sand, the APECs 1, 4, 15 and 29 (Foundry, Sand Storage and Mixing, and fill quality over the Site where excess sand may have been placed) were assessed together. Samples were generally collected in the first investigation phase (2017) to determine if additional sampling was required. For all the soil (23 samples from 13 locations) and groundwater (11 samples from 9 locations) samples collected, no detectable concentrations of CPs were found, and all ABNs were non-detect or below the SCS in soil and non-detect in groundwater. Additionally, historical analysis of CPs in GW (not used in the Phase Two ESA as there was no CofA and data was over 10 years old) also did not have detectable concentrations of CPs present. Specific responses to MECP concerns are as follows: • Re: Historical Excavation – This was the location of a capacitor room and was remediated for PCBs. Although enclosed in the foundry, elevated concentrations (or highest concentrations) of chlorophenols were not expected to be present in this area. • Re: Eastern Portion of APEC-1 lacking GW samples groundwater samples were not collected from MW17-106S as no concentrations were detected in the soil samples form this location. • Re: north west corner/truck bay - MW17-107S (SL and GW collected) is located within the western portion of APEC-1 and within 15 m of the truck bay area.
b) There does not appear to be adequate distribution of sampling of metals, petroleum hydrocarbons (PHCs) and volatile organic compounds (VOCs) in soil in APEC-3.	An additional borehole location (BH20-212) was advanced on the west side of the APEC to add adequate distribution to the existing four investigation locations that were sampled for metals, PHCs and VOCs.
c) There appears to be only one sample location for CPs in soil in APEC-4.	As discussed in the response to comment 9a, and the uncertainty to as whether the sand storage was for clean or spent material, one sample was analyzed for CPs and ABNs to determine presence/absence and the result of this (and all samples on site) indicate non detectable concentrations of CPs in soil (and groundwater). We believe that the current sampling and locations provide adequate coverage characterizing the APEC.
d) There do not appear to be any soil sample locations for polycyclic aromatic hydrocarbons (PAHs) and VOCs and no ground water sample locations within the galvanizing room associated with APEC-5.	Two soil samples and one groundwater sample from one location (MW17-108S) were collected within APEC-5 and analyzed for all the COPCs identified for the APEC (Metals, PHCs, PAHs and VOCs). The location was placed central and downgradient (less than 3 m) from the approximate location of the galvanizing building (based off an FIP, has a margin of error), in a location where typical management/disposal of waste would have occurred (i.e. "out the back door"). Soil results from this location showed no detectable concentrations of VOCs and PAHs and exceeded the SCS for PHCs and metals. Concentrations in soil of zinc, specifically, are shown to increase with depth in this area, up to the bedrock surface (maximum of 67,200 at MW17-108S) – likely the result of release(s) of molten zinc (liquid) to the ground. Likely due to zinc being largely insoluble by nature, these impacts in soil do not result in groundwater concentrations above the SCS. Subsequent samples (TP18-309, TP18-310 and BH18-207) were collected within the APEC for these parameter groups exceeding (PHCs and metals) within 5-10 m of the original location, and results showed concentrations less than MW18-108S. BH18-207 was located within the area that was likely the former building footprint and concentrations of zinc were reported up to 37,500 ug/g at 0.76-0.89 mbgs; an additional metal sample was collected at the bedrock contact to ensure the maximum zinc concentrations were captured. Samples of VOCs and PAHs were included for additional characterization, and a new maximum concentration of trichloroethylene (TCE) was found at the surface which reduced to concentrations which met the SCS before the depth of the water table. MW18-108S remained as the location of the maximum zinc in soil.
e) There do not appear to be any soil and ground water sampling locations within the oil houses associated with APEC-7 and associated tanks are	There are 7 soil and 3 groundwater sample locations within APEC-7. Table 6-4 summarizes the soil and groundwater analyses associated with APEC-7.

October 10, 2019 MECP Comment		Jacobs Response
	not shown and identified.	BH07-56 and MW-103S/D are located very close to or within the footprint of the oil house which cover BTEX and PHCs in soil and groundwater. It is noted that building locations are estimated based on what was shown on FIPs and/or historical report figures, and locations were placed in areas that would capture potential impacts (i.e. downgradient monitoring well placement). The Site Plan and Historical Buildings Figure (Figure 2-2 in the Phase Two ESA and Figure 6-2 of the Phase One Summary in the RA) has been added to the CSM (Figure 2-2) which shows the location of the ASTs as well as known buildings, UST and other site features.
f)	The former underground storage tank (UST) associated with APEC-8 is not shown and identified.	The Site Plan and Historical Buildings Figure (Figure 2-2 in the Phase Two ESA and Figure 6-2 of the Phase One Summary in the RA) has been added to the CSM (Figure 2-2) which shows the location of the ASTs as well as known buildings, UST and other site features.
g)	There do not appear to be any soil or ground water sampling locations within the oil house associated with APEC-9.	There are 3 soil and 3 groundwater sample locations associated with APEC-9. Table 6-4 summarizes the soil and groundwater analyses associated with this APEC. BH07-54 and MW17-105 series wells are located close (3-4 metres) to or within the footprint of the oil house; the building location is approximated as they are based on the available FIPs.
h)	It is unclear if there are any sampling locations in the location(s) where machine shop cuttings were stored on the ground north of the machine shop building associated with APEC-10 given that this area is not located and identified in figures in the phase two CSM.	The area north of the machine shop was included in the 1999 excavation/remediation. Text has been added to the APEC description to clarify that the soils in this area have been removed and backfilled.
i)	It appears that the QP is relying on a single soil and ground water sampling location at the northern boundary of APEC-12. In addition, there appears to be additional coal storage east and outside of APEC-12.	The areas of coal storage as determined from the Phase One ESA all fall within APEC-12. The APEC description has been worded more clearly; previously text was confusing as it was referencing changes to the extent of the area based on the FIPs reviewed. An additional borehole (BH20-213) was advanced in the central area of the APEC for additional characterization in soil for PAHs and metals. No exceedances were found, and therefore no further groundwater locations were added.
j)	There do not appear to be any soil sampling locations for PAHs and only one soil sample location for metals within the northern length of APEC-13.	Two additional test pits (TP20-322 and TP20-323) were excavated in the northern length of the former rail line for characterization of PAHs and metals in soil.
k)	There do not appear to be any ground water sampling locations for the identified contaminants of potential concern (COPCs) within the former building footprint associated with APEC-14.	OW10 is located south and downgradient (8m) of the possible auto storage, maintenance and repair building, and within the identified APEC boundaries. Based on the age of the building and remaining concrete foundation observed in the field, the monitoring well is located in an appropriate location to capture potential impacts. We believe that the current sampling and locations provide adequate coverage for the APEC.
l)	There appears to be only a single soil sample location and no ground water sampling locations for the identified COPCs within the sand mixing/storage building associated with APEC-15 and only one soil sample location for CPs in APEC-15.	As discussed in the response to comment 9a, one sample was analyzed for CPs and ABNs in the central area of APEC-15, and along with the other foundry sand related samples/APECs to determine the presence/absence of these constituents at the entire Site. The result of this (and all samples on site) indicate no detectable concentrations or trace concentrations below the SCS of CPs/ABNs in soil (and no detectable concentrations in groundwater). OW07-37, located within the APEC had groundwater samples collected for the identified COPCs. Soil and groundwater results by APEC are summarized in Table 6-4.
m)	There do not appear to be any sampling locations for the identified COPCs in the central portion of APEC-16 where the transformer area appears to be located.	OW07-32 is located 2 metres downgradient from what appears to be the transformer pad and is located within the APEC boundaries. Sampling locations are taken from outside the pad, where material could have been spilled directly to the soil/ground; the concrete pad tends to act as a cap. We believe that the current sampling and locations provide adequate coverage for the APEC.
n)	There do not appear to be any sample locations for PAHs within the coal storage building footprint or coal pile west of the coal storage building associated with APEC-18.	PAHs were analyzed in one soil location (MW17-100S) and two groundwater locations (MW17-110S and OW07-38S) for the coal storage APEC. An additional borehole (BH20-214) was advanced for further characterization of PAHs in the APEC.
o)	There do not appear to be any soil sampling locations for PHCs, PAHs and VOCs within the garage building footprint associated with APEC-20.	It is noted that the garage footprint was very small (less than 10 x 10 metres). Various historical reports placed the building north (P&R) or south (DCS) of the historical sampling locations, and recent field investigations could not confirm its exact location. Historical investigations were based on visual observations of impacts and activities at the time, and therefore are believed to have captured the areas with the highest likelihood of contamination. Some historical data was not used in the Phase Two dataset (soil samples with no CofA, or old VOC/TPH data) and the recent sampling program included locations to reevaluate /supplement this data (ie TP17-300, resampling of OW15/16). We believe that the current sampling and locations provide adequate coverage for the APEC.
p)	There do not appear to be any soil sampling locations for PAHs within the coal storage building footprint associated with APEC-21.	The former coal storage area footprint is very small (6 x 10 m) and makes up the southern portion of the former garage (APEC-20). Accuracy is based on FIPs alone as the previous investigations were likely conducted when coal was no longer used as a fuel source; TP17-300 and TP18-318 are approximately 17 m apart, on either side of what we've identified as the coal storage area, and likely capture any potential impacts. We believe that the current sampling and locations provide adequate coverage for the APEC.
q)	There do not appear to be any soil sampling locations for PHCs, VOCs and PAHs or ground water sampling locations within the paint shop	There is one location (MW17-110S) for soil and two locations (MW17-110S and OW07-38S) for groundwater to the south of the building footprint, within the APEC boundaries. An additional borehole (BH20-214) was advanced within the building footprint for further characterization of VOCs, PHCs, PAHs and metals in the APEC.

October 10, 2019 MECP Comment	Jacobs Response
building footprint associated with APEC-23.	
r) There appear to be gaps in the assessment of PHCs, PAHs and VOCs in soil in the western, west-central and east-central portions and PHCs and PAHs in ground water in the west-central portion of the former drum storage area associated with APEC-25.	For soil, OW07-31 includes samples with PHCs and VOCs for the western side, TP17-302 includes PHCs, PAHs and VOCs for the west-central area. Historical data is available in the east-central area for location "12" for VOCs and TPH and "12SE10" for TPH, however the data dates back to 1991 and therefore was not considered reliable for the Phase Two ESA. An additional testpit (TP20-322) was added in the central area of the former drum storage area and soil samples analyzed for VOCs, PHCs, PAHs and metals. For groundwater, MW18-115S was added for sampling of VOCs, PAHs and PHCs to provide the additional coverage in the west-central portion to supplement the data from OW07-31, OW02, and OW17.
s) There do not appear to be any soil or ground water sampling locations for the identified COPCs within the electrical shop associated with APEC-27.	The footprint of the former electrical shop is very small (approx. 5 x 10 m). As the building/addition was built after 1960, the concrete slab likely provided a barrier for soil and groundwater contamination directly within/beneath the building footprint. Sampling locations were placed for downgradient coverage of the COPCs in soil and groundwater. An additional testpit (TP20-324) was added within the former electrical shop footprint for greater coverage of the COPCs. No impacts other than zinc were found (which is representative of the entire site) and therefore the existing groundwater locations were still considered adequate coverage.
t) The description for APEC-29 associated with fill material of unknown quality also refers to oiling of exterior yard areas for dust control. Oiling of yard areas should be identified as a separate APEC(s) and yard areas where oil was applied should be clearly shown and identified in figures to demonstrate that these area(s) where oil was applied have been adequately assessed.	Jacobs believes the fill material of unknown quality is more reasonably applied to all areas of the site, including the oiled yard areas as it is not known to which areas of the site the activities occurred. The unknown fill description applies to all historical filling activities that may have occurred, such as dumping foundry sands, or other operational waste and therefore a large number of COPCs have been considered. COPCs for oiled areas (ie PHCs) are therefore included and the dataset provides good PHC coverage in the yard areas.
Note that identifying and locating where any PCA and/or potential sources of contamination have occurred and showing tanks in such areas is required in the phase one CSM and on figures showing the property before actions taken to reduce the concentration of contaminants in the phase two ESA. The phase two CSM must demonstrate that samples have been collected and analyzed from areas where maximum concentrations are expected and that the distribution of samples within each APEC is representative of the full extent of each APEC.	
10. Subsection 7(1) and 16 of Schedule E – The QP shall ensure that all areas on, in or under the phase two property where a contaminant is present at a concentration greater than the applicable SCS for the contaminant shall be delineated laterally and vertically for each contaminant present in soil, ground water or sediment, on, in or under the phase two property. In addition, section 16 specifies additional characterization requirements for when analysis shows that the contaminant is present at a concentration greater than the applicable SCS. The following issues were identified:	
• There appears to be a gap in the lateral delineation of benzene, toluene, ethylbenzene, xylenes (BTEX) in soil in BH07-66.	Exceedances of BTEX at BH07-66 are marginal, with non-detect results from samples immediately below (TP18-317), and a significant amount of BTEX sampling has been completed across the Site. Samples used for lateral delineation are approximately 30 m away and we consider them to be adequate coverage.
• There do not appear to be any deeper ground water sampling locations to vertically delineate benzene in ground water in MW17-102D nor do there appear to be up/cross- gradient samples at laterally delineate at similar depth.	The exceedance at MW17-102D was considered anomalous as it is not present in the soil or shallow groundwater in this area of the Site (ie. OW07-34S/D, OW26S, MW107S, MW18-121S). Deeper groundwater sampling locations to vertically delineate the marginal exceedances of benzene include MW18-107D, MW18-121D and MW18-123S where benzene concentrations were not detected. Additional notes have been added to the CSM to describe this uncharacteristic concentration.
• Trichloroethylene (TCE) is reported as exceeding the applicable SCS in MW18-113D; however, it is unclear if TCE has been vertically delineated in this area. It is further noted here that there do not appear to be any shallower ground water sampling for VOCs in this area.	MW18-113 is located in an APEC assessing off-site GW impacts, and no known historical site activities occurred in this area. A full monitoring well network was sampled for VOCs in the latest sampling event (February 2020). MW18-113D and MW18-113S met the SCS with non-detect concentrations. Appropriate notes have been included in the CSM to indicate that due to two subsequent samples meeting the SCS, this location in no longer considered to exceed the SCS.
• There appears to be a general gap in the delineation of VOCs in the northwestern portion of the property.	The northwestern corner of the property was the employee parking lot and no APECs associated with VOCs were identified in this area. Existing VOC impacts are related to the regional groundwater quality. Existing shallow groundwater wells (MW18-112S, MW18-113S, MW18-114S, MW18-115S, MW18-117S and MW18-124S) on the northwest portion of the property were sampled for VOCs to confirm the characterization of the shallow groundwater. All shallow monitoring wells met the SCS.
• BTEX in soil exceeded the applicable SCS in BH07-66 at the overburden-bedrock	The historical soil sample collected from BH07-66 spanned the entire depth of soil (ie 0.05 to 1.22) so it is unclear if impacts were truly extended to bedrock. The soil exceedances here are fairly marginal and additional samples from 2017 at the rock interface immediately adjacent to BH07-66 (TP18-317) were nondetect for BTEX.

October 10, 2019 MECP Comment	Jacobs Response
interface; however, no ground water sampling appears to have been conducted at this location.	The PIDs readings from the original BH were low (less than 10 ppm) and no gross impacts or staining is noted on the original BH log. Therefore, the potential for BTEX impacts in groundwater to be associated with these minor soil impacts is low.
• There do not appear to be any ground water sampling locations for PHCs in the vicinity of MW18-117S and BH07-60 in the northwestern portion of the property where PHCs exceeded the applicable SCS in soil.	MW18-117S, the shallow well in the centre of the PHC soil impacted area was sampled for PHCs in GW in February 2020 and all results were non-detect, meeting the SCS.
• It is acknowledged that further lateral and vertical delineation of VOCs in soil will be undertaken.	Acknowledged. Lateral and vertical delineation of VOCs in soil was completed and updated. TCE exceedances in soil at MW17-102D were no longer considered to exceed the SCS as soil results from a subsequent sampling event met the SCS and remained below the SCS when averaged with the previous results. A new VOC maximum (TCE) was found in the surface soil at BH18-207 and was adequately delineated with two deeper samples and locations sampled for VOCs in the immediate vicinity.
The QP will be required to delineate the lateral and vertical extent of these contaminants in soil and in ground water by conducting further phase two investigation activities.	
11. Section 43 and Table 1, Report Section 6, Sub-Heading (x) of Schedule E – The phase two CSM submitted with the RSC is required to demonstrate the current condition of the phase two property or, where remedial actions have been undertaken, the condition of the phase two property before the remedial actions were undertaken. The following information is missing from the phase two CSM:	
• A narrative description of, and, as appropriate, figures illustrating the physical setting of the phase two property and any areas under it including:	
a. Hydrogeological characteristics, including aquifers, aquitards and, in each hydrostratigraphic unit where one or more contaminants are present at concentrations above the applicable SCSs, lateral and vertical hydraulic gradients. The magnitude of the downward and upward hydraulic gradients should be provided.	This information has been added to the CSM text.
b. Any respect in which section 41 or 43.1 of the Regulation applies to the property. This section of the phase two CSM should include an evaluation of presence/absence of areas of natural significance.	This information has been added to the CSM text.
• Where a contaminant is present on, in or under the phase two property at a concentration greater than the applicable SCS, identification of:	
i. The distribution, in each of the areas where a contaminant is present on, in or under the phase two property at a concentration greater than the applicable SCS, of each contaminant present in the area at a concentration greater than the applicable SCS, for each medium in which the contaminant is present, together with figures showing the distribution. A narrative description of lateral and vertical distribution of BTEX in ground water in MW17-102D appears to be missing from the phase two CSM.	As per a previous comment, the exceedance at MW17-102D was considered anomalous as it is not present in the soil or shallow groundwater in this area of the Site (ie. OW07-34S/D, OW26S, MW107S, MW18-121S). Deeper groundwater sampling locations to vertically delineate the marginal exceedances of benzene include MW18-107D, MW18-121D and MW18-123S where benzene was not detected. Additional text has been added to the CSM to describe this uncharacteristic BTEX concentration in groundwater at MW17-102D.
• The title of Figure 6-4 of the phase two CSM refers to "inorganics". Please note that all contaminants should be identified using the Method Groups as identified in the "Protocol for Analytical Methods in the Assessment of Properties under Part XV.1 of the Environmental Protection Act", March 9, 2004, amended as of July 1, 2011, which are also listed in footnote number 3 of the approved APEC table form.	Figure titles for Inorganics have been updated to reflect where Metals, Hydride-forming Metals, and Other Regulated Parameters are shown.

October 10, 2019 MECP Comment	Jacobs Response
• The phase two CSM should provide confirmation that maximum concentration of cis-1,2- dichloroethene (cis-1,2-DCE) in ground water under the property have been located and identified.	There is confidence that concentration of 1,2-DCE onsite in OW24D is the maximum concentration given its proximity to the known offsite source of chloroethenes and the consistently lower concentrations found across the remainder of the Site. Text explicitly stating this information has been added to VOC Groundwater discussion in the CSM.
• Based on figures in the phase two CSM there appear to be a number of ground water sampling locations that exceeded the applicable SCS and subsequently met the applicable and are highlighted as meeting the applicable SCS; however, no further explanation for each is provided. It is unclear what the rationale is for why these ground water sample locations are considered to meet the applicable SCS. For example:	The explanation of these groundwater exceedances which were considered non-representative based on subsequent groundwater sampling data meeting the SCS were not provided in the Phase Two CSM text, but rather in the Phase Two Summary (Attachment A2, Table 6-10b of the PSF). Table 6-10c has been added to form part of the Phase Two CSM and outlines the rationale for the exclusion of non-representative detected data with a MECP SCS.
i. Antimony is identified on Figure 6-12 as having initially exceeded the applicable SCS in ground water in MW118-114D and then subsequently meeting the applicable SCS, but is highlighted as meeting the applicable SCS. Similarly, lead is reported as having exceeded the applicable SCS in ground water in OW07-33 and subsequently meeting the applicable SCS in two subsequent sampling events, but highlighted as meeting the applicable SCS. Similar issues were identified for zinc in ground water in OW12 and OW26S and arsenic in ground water in MW17-101D. However, no explanations are provided in the CSM.	The rationale for the exclusion of specific antimony, lead, zinc, and arsenic groundwater results as exceedances based on at least two subsequent sampling events meeting the SCS was provided in Attachment A2, Table 6-10b of the PSF. These rationales are now included in Table 6-10c of the CSM.
ii. Benzene is identified on Figure 6-14 as having exceeded the applicable SCS in ground water in MW18-112G and subsequently meeting the applicable SCS and is highlighted as meeting the applicable SCS; however, no explanation is provided.	The rationale for the exclusion of specific benzene groundwater results as exceedances based on at least two subsequent sampling events meeting the SCS was provided in Attachment A2, Table 6-10b of the PSF. This rationale is now included in Table 6-10c of the CSM.
iii. PHC F2 is identified on Figure 6-15 as having exceeded the applicable SCS in ground water in OW18-II and subsequently meeting the applicable SCS and is highlighted as meeting the applicable SCS; however, no explanation is provided.	The rationale for the exclusion of specific PHC F2 groundwater results as exceedances based on at least two subsequent sampling events meeting the SCS is provided in Attachment A2, Table 6-10b of the PSF. This rationale is now included in Table 6-10c of the CSM.
iv. Polychlorinated biphenyls (PCBs) are identified as having previously exceeded the applicable SCS in ground water in OW26S in 2010 and subsequently meeting the applicable SCS in 2011 and 2017 at this location.	The rationale for the exclusion of specific PCB groundwater results as exceedances based on at least two subsequent sampling events meeting the SCS is provided in Attachment A2, Table 6-10b of the PSF. This rationale is now included in Table 6-10c of the CSM.
If an initial sampling result that is greater than the applicable SCS is considered to be non-representative, a rationale for why should be provided and where there has been only a single subsequent sampling event, at least one additional round of ground water sampling should be conducted to confirm. If the initial exceedance is representative of site conditions (e.g., true/real exceedance), then delineation would be required.	Comment noted. The requested information was initially provided in the PSF but was provided in the Phase Two ESA Summary Appendix (A2) and not specifically detailed in the Phase Two CSM. A table outlining the rationale for the exclusion of non-representative detected data with a MECP SCS has been added to form part of the Phase Two CSM (Table 6-10c).
• The lateral and/or vertical distribution of contaminants in cross-sections on Figures 6-3c, 6-5a, 6-5b, 6-6a, 6-6c, 6-6d, 6-7a, 6-7b, 6-8a, 6-10a, 6-10b, 6-12a, 6-14c, 6-14d and 6-17a did not follow the requirements of clause 7(4)(c), Schedule E, which states the following: "the delineation is conducted by assuming the lateral and vertical extent of the area in which a contaminant is present at a concentration greater than the applicable SCS for that contaminant extends laterally or vertically, as the case may be, from a sampling location at which the contaminant is present at a concentration greater than the applicable SCS for the contaminant to the next sampling location at which the concentration of the contaminant is equal to or below the applicable SCS for the contaminant".	Improvements have been made to the lateral and/or vertical distribution of contaminants in the updated CSM figures: Figure 6-3c, metals in soil: contaminant extent is continued to the surface, and BH07-55 is projected from the plan view. Figure 6-5a, BTEX in soil: the surface elevation of BH07-66 is corrected, and TP18-318 is projected from the plan view. Figure 6-5b, BTEX in soil: TP17-306 is projected from the plan view, and contaminant extents are extended to the bedrock surface. Figure 6-6a, PHCs in soil: contaminant extents are extended laterally to match the plan view and vertically from surface to bedrock; TP13-04, BH18-205 and BH18-207 are projected on from the plan view. Figure 6-6c, PHCs in soil: MW18-119 is projected on from the plan view. Figure 6-6d, PHCs in soil: TP17-306 is projected on from the plan view. Figure 6-7b, PAHs in soil: An additional five locations projected from the plan view for lateral delineation. Figure 6-8a, VOCs in soil: previous cross-section of A-A' is replaced with H-H' (now Figure 6-8b) which includes a new maximum for TCE at BH18-207. Figure 6-10a, PCBs in soil: BH07-41 and TP18-316 are projected on from the plan view for lateral delineation.

October 10, 2019 MECP Comment	Jacobs Response
	Figure 6-10b, PCBs in soil: contaminant extents are extended up to the former capacitor excavation limits Figure 6-12a, Metals in groundwater: previous exceedances at OW07-37 have been removed as two subsequent samples met the SCS, and contaminant extents are updated. Figure 6-14c, BTEX in groundwater: MW17-102D is projected on from the plan view to account for the contaminant area between two clean groundwater samples. Figure 6-14d, BTEX in groundwater: MW18-128D and MW18-133D are projected on from the plan view for vertical delineation. Figure 6-17a, VOCs in groundwater: MW18-119S/D are projected from the plan view and the contaminant extents are extended to show the regional TCE related groundwater impacts at depth (as well as in Figure 6-17e).
• The screened interval of monitoring wells should clearly identified oncross-sections showing the lateral and vertical distribution of contaminants.	The screened interval in metres are shown listed in the callouts and are also represented by the length of the green or red coloured bars for each monitoring well location on the cross-section. This information has been added to the figure notes for clarification.
12. Subsection 47(15) of Schedule E – Figures, maps, site plans and cross-sections are required to contain a scale, north arrow and a title block that includes a descriptive title, the address of the phase two property, if any, the name of the QP's firm, company or partnership, if any; and the date the figure, map, site plan or cross-section was created. The following issueswere identified:	
• The figures are marked "Draft", indicate that "Locations are approximate" and the title block is missing the date the figure was created.	The draft watermarks have been removed from the figures. The note regarding "locations are approximate" has been revised to indicate that "historical locations are approximate". Current locations or existing historical monitoring wells have been surveyed as part of the Phase Two ESA. The date the figure is provided at the bottom left corner of the figure but has also been added to the title block in the updated CSM.

METRIC: DISTANCES SHOWN ON THIS PLAN ARE IN METRES AND CAN BE CONVERTED TO FEET BY DIVIDING BY 0.3048.

Re: Notice of a Circumstance requiring additional information for 200 Beverley Street, Guelph, Ontario (Property)
Risk assessment number 6417-B9XQGZ
TASDB file number RA1748-19a

This is to acknowledge your submission of a risk assessment report on 2020/06/22 regarding the Property to the Ministry of the Environment, Conservation and Parks (Ministry). By way of this letter I am providing you written notice, prior to making a decision under section 168.5 of the *Environmental Protection Act* (the Act), that the Director is aware of the following circumstance:

The content of the risk assessment report does not comply with a requirement specified in section 4 or 5 of Schedule C of Ontario Regulation 153/04.

Due to the above-noted circumstance, this is to request that you:

- revise and resubmit the risk assessment to the Director in accordance with the directions specified below in Schedule A

By way of this letter the Director is providing you notice that a new time to respond to a risk assessment will commence on the date that the Qualified Person submits the revised risk assessment in accordance with this notice.

At any time the owner may withdraw the risk assessment by giving written notice to the Director.

For your information the Act, Regulation, guidance documents and associated fact sheet have been posted on the world wide web at:

https://www.ontario.ca/page/brownfields-redevelopment

Craig Kinch

Director, Environmental Protection Act s. 168.5

SCHEDULE A
To Director's Notice
Comments by the Ministry of the Environment, Conservation and Parks On Risk Assessment
for
200 Beverley Street, Guelph, Ontario
RA1748-19a
IDS Ref. No. 6417-B9XQGZ

The following are Ministry comments on the following Risk Assessment (RA):

- **Risk Assessment Report for 200 Beverley Street, Guelph, Ontario report prepared by Jacobs Engineering Group Inc., dated June 2020**

Comments On Risk Assessment

General Comments

The Site is the former International Malleable Iron Company (IMICO) foundry facility with an approximate area of 5.2 hectares. The Site was first developed in 1913 when it was acquired by IMICO and closed in 1989. Demolition of the buildings and removal of various wastes from the Site (including some excavated soil and PCB materials and a large aboveground AST) occurred in 1998/1999. The Site is currently vacant with no on-site operations occurring. The future redevelopment plans at this time are unknown, but may include one or more of residential, parkland, and commercial use.

Several issues have been identified in the site characterization, HHRA and ERA that need to be addressed before the risk assessment can be considered to meet the requirements of O. Reg. 153/04.

Note that some of the comments included in this document (Schedule A) may be related to the adequacy of the environmental site assessment (ESA) work performed to support the approach and conclusions of the RA. Note that acceptance of the qualified person (QP's) responses on these ESA-related matters is for the purpose of supporting a decision on the RA only; a full regulatory review of the ESAs has not been conducted. The Ministry may undertake a more in depth review of the phase one and phase two ESA reports at the time the record of site condition (RSC) is submitted for filing to ensure that all the regulatory requirements have been met. Information relevant to the phase one and two ESA reports (e.g., table of areas of environmental concern, the conceptual site models) that is amended as part of the RA should be reflected in updated phase one and two ESA reports prior to submitting RSCs for filing. If the QP_{ESA} has any questions regarding meeting the ESA requirements at the time of RSC filing, it is suggested that they contact Rose Ash of Client Services and Permissions Branch; email: rosemary.ash@ontario.ca

Specific Review Comments

PSF Comments

1. No response was required.

2. The response addresses the comment.

3. The response partially addresses the comment.
    a. Based on information provided in Sections 1.8.4 and 1.9.4, it appears that the extent of LNAPL in soil/groundwater has not been fully delineated as LNAPL has been found in BH07-41 (assumed during drilling) but no monitoring well is present in this area. Given the presence of LNAPL in soil and groundwater at and below the overburden and bedrock contact and shallow groundwater at the Site, it should be confirmed that free phase product has been adequately characterized and removed to the extent practicable.
    b. Free phase product should also be depicted/included in a plan view figure, cross-sectional figure and the HH and ERA CSMs (e.g. Figure 4-1, 4-2, 5-1 and 5-2).
    c. Section 3 of the RA report should include information related to NAPL chemical and physical characteristics, NAPL mobility, stability and recoverability, dissolved phase (groundwater) and vapour phase (soil vapour) concentrations, and acute-risk concerns (e.g. explosive conditions).

4. The following comments are provided:
    a. The response addresses the comment.
    b. The response partially addresses the comment. The Reviewer was unable to locate where the rationale for the suitability of using the CCME value for tin was provided in the RA.
    c. The response addresses the comment.
    d. The response partially addresses the comment. The reference provided for bismuth represents a risk-based concentration level (and addresses human health only). It is not an estimate of naturally occurring background levels. If bismuth may be present at the site at concentrations exceeding naturally occurring background levels, then it would be considered a contaminant that should be appropriately delineated, and addressed in the RA (where the TCEQ PCL could then be applied as a qualitative screening level in the HHRA). Unless good information on expected naturally occurring background levels of bismuth can be provided, this COC should not be screened out.

5. The following comments are provided:
    a. No response was required.
    b. The response addresses the comment. See additional comments regarding HHCSMs below.

6. The response addresses the comment.

7. The response addresses the comment.

Risk Assessment Comments (October 2020)

Section 3.0 - Property Information, Site Plan and Geological Interpretation

1. Section 3.3.5 – Further rationale and justification for the screening of some chemicals is required. The QP is reminded that chemicals that may be associated with APECs at the site but do not have associated SCS should be considered COCs if they are present at concentrations exceeding naturally occurring background levels. Specific comments include the following:
    a. There appear to be discrepancies between the screening tables in Appendix F and the information provided in Table 6-7b in Appendix D (Rationale for the Removal of Soil COCs). For example, iron is indicated as not exceeding the modified OTR value in Appendix F, but nine samples are noted as exceeding this value in Table 6-7b. The Reviewer assumes this is because the data with higher concentrations was removed from consideration; however, it is unclear why iron would not be a COC at a site that was historically operated as an iron foundry. As iron would be associated with an APEC at the site and has been measured at concentrations exceeding naturally occurring background levels, it would be considered a contaminant and should be assessed as a COC in the RA.
    b. Additional consideration should also be given to other parameters (e.g., phosphorus, magnesium, strontium) with observed concentrations exceeding the OTR with respect to potential association with APECs at the site (i.e., a rationale should be provided as to why they would not be expected to be associated with past site activities).

Section 4.0 - Human Health Risk Assessment

2. Sections 4.1.2.1 and 4.1.2.2 – Soil and groundwater component values used for the secondary screening should be provided in Tables 4-1 and 4-2.

3. Sections 4.1.2.1 and 4.1.2.2 – The process of selection of COCs in soil and groundwater for the trench air inhalation pathway for construction and utility worker receptors should be discussed in these sections.

4. Section 4.2.2 (Figure 4-1) – Groundwater ingestion (potable water) should be shown as a complete pathway for the indoor worker receptor in Figure 4-1 based on discussions provided in Section 4.2 and Table 4-13. Similarly, incidental groundwater ingestion should be shown as a complete pathway for the off-site construction/utility worker receptors in Figure 4-1 based on discussion provided in Section 4.2 and Table 4-13.

5. Section 4.3 – Subchronic TRVs were provided in Table 4-26 for some chemicals; however, it is not clear if the subchronic TRVs were used for estimation of risks for any of the receptors. Further, for some parameters more than one TRV was provided in Table 4-26 (e.g., SF and URF for vinyl chloride) and it is not clear if different TRVs were used for the estimation of risks for some receptors in the RA (e.g., composite receptor vs adult/toddler receptor). Clarification should be provided in Section 4.3.

6. Section 4.4.3.2 – It is unclear why the potential for risks to offsite receptors via the migration of soil gas is considered low. Supporting information should be provided and discussed here for potential offsite migration of volatile impacts in groundwater as well as lateral migration of soil gas from onsite soil to the nearby offsite buildings.

7. Section 4.4.5 – The text in this section can be interpreted to imply that Section 43.1 of the Regulation also applies due to the presence of water bodies within 30 metres of the site, which was likely not the intent. The Reviewer notes that it is indicated in Section 5.1.1 that there is no surface water or aquatic habitat within 30 metres of the RA property. The text should be clarified accordingly.

8. Section 4.4.6 – Further information should be provided on the basis for assessing some COCs in groundwater as potentially mobile, and others not.

Section 5.0 - Ecological Risk Assessment

9. Section 5.2.2 –It is unclear that potential habitat for all reptiles and amphibians would not be present at the site given the vacant nature of the property and the extent to which portions of the site have become re-naturalized. The Reviewer acknowledges that exposure and toxicity information is less available for reptiles and amphibians, but if the receptors in these categories may occur at the property, then they should be assessed qualitatively to the extent possible (i.e., in Section 5.5.3), and any limitations in the approach discussed in the uncertainty assessment (as was done for off-site receptors in this category).

10. Section 5.3.1 – It is indicated in this section that groundwater effects on birds and mammals were not assessed. Considering the shallow groundwater depth at the Site, potential indirect exposure to groundwater for mammals and birds via terrestrial plants may be possible. Clarification is required.

11. Section 5.5.2.2 – The following comments are provided:
    a. The presence, or potential presence, of NAPL is inconsistent with the determination that the HQ for PHC F3 and F4 would be less than one (i.e., the assumption that F3 and F4 are insufficiently soluble to result in concentrations that would be sufficiently elevated to pose a concern is obviated by the presence of NAPL). Further consideration of this issue is required.
    b. The Reviewer agrees that rooting zones may be shallower than 1.5 metres for many

types of vegetation, but this would not necessarily be true for some types of vegetation, notably mature trees. Further consideration of this issue is required relative to potential risks and RMMs that may apply to mature trees.

c. Thin fill cap has been recommended in the RMP for the existing mature trees that will remain onsite following site redevelopment. A discussion of the locations of these trees with respect to the areas with shallow groundwater should be provided.

12. Section 5.5.5 – The text in this section can be interpreted to imply that Section 43.1 of the Regulation also applies due to the presence of water bodies within 30 metres of the site, which was likely not the intent. The Reviewer notes that it is indicated in Section 5.1.1 that there is no surface water or aquatic habitat within 30 metres of the RA property. The text should be clarified accordingly.

Section 6.0 – Conclusions and Recommendations

13. Section 6.3 – It is unclear from the discussion provided whether potentially recoverable NAPL may be present at the property. It is the Ministry's expectation that NAPL will be recovered to the extent practicable. Additional discussion is warranted for completeness.

14. Section 6.4 and Table 6-3 – It is unclear if the fill cap concentrations take into consideration all the applicable component values and relevant exposure pathways (e.g. S-Nose, inhalation from a trench scenario, etc). This should be clarified.

Other Comments

15. Appendix D – A rationale for and description of any hydrogeological and geological interpretations which differ from assumptions on which the Soil, Ground Water and Sediment Standards are based is required to be included with the ESA summary.

Phase Two Conceptual Site Model Comments

All comments have been adequately addressed.

Summary and Conclusions

Several issues have been identified in the review of the risk assessment that will need to be clarified before the risk assessment can be accepted under O. Reg. 153/04.

Comments On Risk Management

1. For areas where NAPL has been observed, consideration needs to be given to including a provision in the RMP for prohibiting the construction of buildings with basements or other occupied below grade structures in these areas for as long as the NAPL remains present in these areas. Please contact the District Office to discuss prior to resubmission.

2. Should slab-on-grade buildings be constructed in the areas where residual NAPL remains, additional design considerations/details are required to be provided in Appendix I.2 as it relates to the presence of NAPL and the conceptual vapour mitigation systems as proposed.

3. Imported "Unimpacted Soil" as defined in Section 7.2.2 of the Risk Assessment and related sections in Appendix I includes a reference to O. Regulation 406/19 and the Rules for Soil Management and Excess Soil Quality Standards. These references need to be removed as a Risk Assessment under O. Regulation 153/04 (as amended) is being undertaken and the issued CPU will take precedence. As such, any imported "Unimpacted Soil" must meet the applicable generic site conditions standards for this property as identified in the Risk Assessment (i.e. Table 6 SCS). This reduces confusion and uncertainty. Please contact the District Office directly to discuss prior to resubmission.

4. Section 7.2.3.1: The HSP requirements need to include consideration of the potential risks associated with dust, soil/groundwater vapour and the presence of NAPL.

5. Section 7.2.3.2 needs to include the following:
    - management measures and an action plan (including appropriate disposal options) for NAPL if encountered. If NAPL is encountered, notification to the Director in writing within 24 hours of the NAPL being encountered.

6. If buildings with basements are not prohibited, as recommended in 1.0 above, Section 7.2.3.3 will need to be updated to include provisions for the presence of NAPL.

7. Section 7.4.1 needs to be updated to include timelines for notification requirements to the Director. Typical timelines are included below for reference and will be modified and incorporated into the CPU as warranted.
    - *In the event that the indoor air and or sub-slab vapour monitoring program identifies one or more of the Target Analytes at concentrations above the Target Indoor Air/ Sub-Slab Vapour Target Concentrations in **Table 1XXX**, respectively, and where the concentrations of the observed Target Analytes are determined by the qualified Licensed Professional Engineer to be a result of soil vapour intrusion, the Owner shall implement the contingency measures detailed in Section XXX of the RA and as follows:*

        i. Written notice shall be submitted to the Director by the Owner within 14 calendar days of the Owner's receipt of the laboratory analysis. This written

notice shall include the indoor air and or sub-slab vapour sampling results (as necessary), the laboratory certificates of analysis and the anticipated timeline for the implementation of the confirmatory sampling program along with any additional work as may be deemed necessary by a qualified Licensed Professional Engineer. Confirmatory sampling shall occur within 14 calendar days from the date of the Owner's receipt of the laboratory analysis and be completed by a qualified Licensed Professional Engineer.

ii. *In the event that the confirmatory indoor air and or sub-slab sampling verifies the exceedances of one or more of the Target Analytes concentrations above the Target Indoor Air Concentration/Target Sub-slab vapour Concentrations in* ***Table 1XXX****, the Owner shall:*

(a) *Submit written notice to the Director within 14 calendar days of the Owner's receipt of the laboratory analysis. This written notice shall include the confirmatory indoor air and or sub-slab vapour sampling results, the laboratory certificates of analysis and the details of, and the anticipated timeline to implement contingency measures consistent with Section XXXX of the RA along with the implementation of further evaluation/assessment of the vapour mitigation system as may be deemed necessary by a qualified Licensed Professional Engineer. The implementation of contingency measures, along with the implementation of a confirmatory indoor air sampling program shall occur within 14 calendar days of the Owner's submission of the written notice of the exceedance to the Director;*

(b) *Within 30 calendar days of the implementation of the contingency plan, the Owner shall submit to the Director an update report prepared by a qualified Licensed Professional Engineer documenting the implementation of contingency measures, results of the implementation of the confirmatory indoor air sampling program along with the details and timelines for the implementation of performance indoor air and or sub-slab vapour monitoring program. The update report shall include, but not be limited to:*

i. *Laboratory results and laboratory certificates of analysis;*
ii. *Field logs, leak testing (as necessary) and documentation of QA/QC;*
iii. *Discussion and interpretation of the results in comparison to the respective Target Indoor Air Concentrations as listed in* ***Table 1XXX****; and,*
iv. *Conclusions and recommendations with respect to the performance of the vapour mitigation system along with the need for additional work and/or continued monitoring as may be deemed warranted.*

8. Section 7.4.3.1 – The groundwater monitoring program needs to include groundwater monitoring wells OW24S/D and OW13-39S/D to monitoring COCs coming onto the property and ensure that they do not exceed the PSS. Further, although the MECP is actively pursuing the identification of the off-site source of the contamination in this area of the property, no Provincial Officers Order has been issued to date. Please update this section accordingly.

9. Section 7.4.3.1 – The groundwater monitoring well network should be updated o include the measurement of NAPL in at least one or two key wells within the areas identified as having residual NAPL. Further, should an increased thickness be observed, passive removal (i.e. use of absorbent pad/socks) or active removal should be triggered along with notification to the Director.

10. Appendix L, Figure I-9 – There was no discussion provided in regards to this figure. Please update this section accordingly.

RESUBMISSION

The risk assessment should be revised and resubmitted to the following address:

The Director
Client Services and Permissions Branch
135 St. Clair Avenue West, 1st Floor
Toronto, ON, M4V 1P5

Telephone 416-314-8001

Four hard copies of the risk assessment should be submitted (one marked original), including a stand-alone, electronic copy of the risk assessment report (in USB format). However, if the ministry is still working remotely, then please follow the interim submission process for risk assessments. Please ensure the electronic copy submitted during the interim submission process is a stand-alone document and that all sections within the submission are bookmarked.

To assist MECP in its review of the resubmission, changes to the risk assessment from the version that is the subject of the above review should be outlined in a revision table or errata sheet attached to the resubmission. Use of a redline method in the body of the revised risk assessment also is recommended, if possible and where practicable.

It also is recommended that the QP_{RA} provide responses to the MECP review comments as an attachment to the submission or as an appendix in the revised risk assessment. This will provide an opportunity for the QP_{RA} to explain to MECP reviewers how the MECP review comments have been addressed in the risk assessment. The QP_{RA} should note that submission of a response to the MECP review comments without a revised risk assessment or addendum is not considered to be a

resubmission of the risk assessment under the Regulation and it may not be reviewed.

The Property Owner and QP_{RA} should note that upon receipt and review of the resubmission, the Director may issue a decision under Section 168.5 (1) EPA to accept or not to accept the risk assessment. If the decision is not to accept the risk assessment, then subsequent resubmissions or provision of additional information cannot be accepted by the Ministry for review. Advancement of a risk assessment of the subject property will require submission of a new Pre Submission Form followed by a new risk assessment of the site in accordance with Schedule C of the Regulation.

It is recommended that before resubmission of the risk assessment, the QP_{RA} review the mandatory requirements for risk assessments submitted under the Regulation, as outlined in Section 4 and Table 1 of Schedule C of the Regulation. As well, the Ministry's *Procedures for Use of Risk Assessment Under Part XV.1 of the Environmental Protection Act* should be used for guidance in how to satisfy the requirements of the Regulation. **It is important that the QP_{RA} also confer with the QP_{ESA} to determine whether the PSS provided will support filing of a record of site condition.**

Some of the comments included in this document (Schedule A) may be related to the adequacy of the environmental site assessment (ESA) work performed to support the approach and conclusions of the risk assessment (RA). Note that acceptance of the qualified person (QP's) responses on these ESA-related matters is for the purpose of supporting a decision on the RA only; a full regulatory review of the ESAs has not been conducted. The Ministry may undertake a more in depth review of the phase one and phase two ESA reports at the time the record of site condition (RSC) is submitted for filing to ensure that all the regulatory requirements have been met. Information relevant to the phase one and two ESA reports (e.g., table of areas of environmental concern, the conceptual site models) that is amended as part of the RA should be reflected in updated phase one and two ESA reports prior to submitting RSCs for filing. In addition, if the work on the phase one and two ESA exceeds 18 months prior to the submission date of the RSC, the phase one and two ESA reports will need to be updated prior to submitting RSCs for filing.

If the QP_{ESA} has any questions regarding meeting the ESA requirements at the time of RSC filing, it is suggested that they contact Rose Ash of Client Services and Permissions Branch; email: rosemary.ash@ontario.ca

If the QP_{RA} has questions regarding the application of the Regulation or the above comments, they should be forwarded by email to:

Ann-Marie Deonarine
Risk Assessment Review Coordinator
Technical Assessment and Standards Development Branch
ann-marie.deonarine@ontario.ca

APPENDIX A3

Response to RA Comments in Schedule A for 200 Beverley Street, Guelph, Ontario

	October 16, 2020 MECP Comment	Jacobs Response	Document Location
PSF Comments			
1	No response was required.	No response required.	--
2	The response addresses the comment.	No response required.	--
3	The response partially addresses the comment.		
	a. Based on information provided in Sections 1.8.4 and 1.9.4, it appears that the extent of LNAPL in soil/groundwater has not been fully delineated as LNAPL has been found in BH07-41 (assumed during drilling) but no monitoring well is present in this area. Given the presence of LNAPL in soil and groundwater at and below the overburden and bedrock contact and shallow groundwater at the Site, it should be confirmed that free phase product has been adequately characterized and removed to the extent practicable.	LNAPL was not found in BH07-41. BH07-41 was erroneously used, and the correct location is BH07-46. Section 1.8.4 has been corrected to indicate that analytical data at BH07-46 suggests the potential for free product with concentrations above the MECP Free Phase Threshold values, and that LNAPL has NOT been currently found in wells in the area of this location. BH07-46 was advanced (by others, in 2007) within the historical excavation area in the north eastern portion of the site and LNAPL was not reported/encountered during drilling. It is noted that where the statement is made "LNAPL has been found in wells in the area of… " that this does not indicate LNAPL was found during drilling at the soil locations indicated, but instead is used to acknowledge the LNAPL observed in nearby well locations. The historically remediated area, that is, the soils excavated to bedrock in 1998 for contaminants including Total Petroleum Hydrocarbons in the northeast corner of the Site, is likely the origin of the remaining LNAPL at the Site. The recent Phase One and Two ESA activities did not uncover an alternate source. The LNAPL has consistently been measured in the eastern portion of the Site in OW23S since 2004, and more recently in newly installed wells MW17-108S and MW18-135S. The groundwater level (and NAPL levels) are within or at the bedrock contact, and the bedrock is highly fractured with evidence of NAPL within the fractures, which therefore makes any NAPL extraction process not feasible, slow, inefficient, and costly.	Appendix D3
	b. Free phase product should also be depicted/included in a plan view figure, cross-sectional figure and the HH and ERA CSMs (e.g. Figure 4-1, 4-2, 5-1 and 5-2).	Locations where free phase product was observed and/or measured is included on both plan view and cross-sectional groundwater figures for PHCs in the CSM (Figures 6-15, 6-15a, 6-15b). A note will be added on the HH/ERA CSM figures to address the presence of free phase product.	Figures 4-1, 4-2, 5-1, and 5-2
	c. Section 3 of the RA report should include information related to NAPL chemical and physical characteristics, NAPL mobility, stability and recoverability, dissolved phase (groundwater) and vapour phase (soil vapour) concentrations, and acute-risk concerns (e.g. explosive conditions).	A subsection has been added to discuss the NAPL and related information.	Section 3.2.1
4	The following comments are provided:		
	a. The response addresses the comment.	No response required.	--
	b. The response partially addresses the comment. The Reviewer was unable to locate where the rationale for the suitability of using the CCME value for tin was provided in the RA.	The following information for tin has been added to footnote "e" of Table F1-1: "The CCME screening values are protective of both human and ecological health and were derived in a manner similar to that of the MECP generic standards. Therefore, the CCME values are considered appropriate to use in the absence of MECP screening values for the selection of COCs."	Appendix F, Table F1-1
	c. The response addresses the comment.	No response required.	--
	d. The response partially addresses the comment. The reference provided for bismuth represents a risk-based concentration level (and addresses human health only). It is not an estimate of naturally occurring background levels. If bismuth may be present at the site at concentrations exceeding naturally occurring background levels, then it would be considered a contaminant that should be appropriately delineated, and addressed in the RA (where the TCEQ PCL could then be applied as a qualitative screening level in the HHRA). Unless good information on expected naturally occurring background levels of bismuth can be provided, this COC should not be screened out.	As stated in Table 6-7b of Appendix D2, bismuth was sampled in 2013 only, included as part of a requested full metals scan from the laboratory, but not as a targeted COC. Bismuth is a parameter that does not have specific evidence of being associated with the Site and was not targeted as a COC. It was suggested by the MECP that bismuth concentrations might be elevated and is known to be associated with speciality alloys, however there are a number of various parameters that can be associated with alloys and there is no specific evidence of any being produced on Site.	No changes made

	October 16, 2020 MECP Comment	Jacobs Response	Document Location
		Of the 12 samples from 10 locations analyzed, only 5 samples (3 locations) had detected concentrations that ranged from 6.4 to 150 ug/g. The location of the highest concentration had a duplicate sample concentration of 36 ug/g, indicating highly variable or anomalous conditions. There is no readily available data on expected naturally occurring background concentrations of bismuth for the area. Toxicity of bismuth is reported to be very low, and has been used to substitute lead in some industries to partially resolve the environmental issues related to heavy metals. The TCEQ PCL was provided as an additional line of evidence on why the QP is of the opinion the concentrations are trivial in nature. The presence and concentrations of this chemical on the Site are not considered to limit the Site use. The QPESA is of the opinion, that based on the above information, screening out bismuth as a COC is the appropriate conclusion.	
5	The following comments are provided:		
	a. No response was required.	No response required.	--
	b. The response addresses the comment. See additional comments regarding HHCSMs below.	No response required.	--
6	The response addresses the comment.	No response required.	--
7	The response addresses the comment.	No response required.	--
Risk Assessment			
1	Section 3.3.5 – Further rationale and justification for the screening of some chemicals is required. The QP is reminded that chemicals that may be associated with APECs at the site but do not have associated SCS should be considered COCs if they are present at concentrations exceeding naturally occurring background levels. Specific comments include the following:	The chemicals that have been called out by the reviewer have not been identified as being associated with the APECs at the Site based on the Phase One ESA conducted, or a review of the entire analytical data set. Messaging from previous RSC files and guidance documentation from the MECP have stressed that the QP is to use their judgement and COCs for the Site are determined at their discretion.	No changes made
	a. There appear to be discrepancies between the screening tables in Appendix F and the information provided in Table 6-7b in Appendix D (Rationale for the Removal of Soil COCs). For example, iron is indicated as not exceeding the modified OTR value in Appendix F, but nine samples are noted as exceeding this value in Table 6-7b. The Reviewer assumes this is because the data with higher concentrations was removed from consideration; however, it is unclear why iron would not be a COC at a site that was historically operated as an iron foundry. As iron would be associated with an APEC at the site and has been measured at concentrations exceeding naturally occurring background levels, it would be considered a contaminant and should be assessed as a COC in the RA.	Based on the QPESA's review of the data, the nine samples of 43 analyzed with concentrations above the modified OTR does not necessarily suggest Site activities are the cause. The locations of these samples are spread out over the Site, not in congregated areas, and occur at various depths. Areas of high iron often correlate with areas of low magnesium, suggesting more of a nutrient balance or naturally occurring variability. Groundwater conditions do not suggest a release or hot spot occurs on site; as similarly only 7 samples from 3 locations (of a total of 58 samples) report concentrations above the PGMIS (see Table 6-10b, Appendix D2), and do not correlate to the locations with highest concentrations in soil. These higher concentrations in groundwater were also found in the deeper well of some well nests (OW03-II and OW09-II) suggesting the concentrations are not due to a surficial release. Based on this information, along with that presented in Table 6-7b of Appendix D2, the QPESA is of the opinion, that screening out the iron as COCs is appropriate.	No changes made
	b. Additional consideration should also be given to other parameters (e.g., phosphorus, magnesium, strontium) with observed concentrations exceeding the OTR with respect to potential association with APECs at the site (i.e., a rationale should be provided as to why they would not be expected to be associated with past site activities).	Other parameters which have observed concentrations exceeding the OTR were not considered associated with APECs at the Site based on available information of the Site's history (Phase One ESA) and the review of the analytical data set and mapping out locations where these exceedances occurred. In many cases exceedances of magnesium and strontium occurred in areas where the lowest iron levels were reported and vice versa. As well, exceedances were not found in common areas, but instead were sporadic across the Site. These observations suggest more of a nutrient balance or naturally occurring variability. Specifically, the following was observed: - Phosphorus concentrations above the OTR occurred in one location (a sample and duplicate) of 43 samples only; which is likely an anomaly as all other concentrations reported were half or less of the OTR. - The highest concentrations of magnesium were reported from the backfill samples of the historical excavation in the northeastern portion of the Site. As stated in Table 6-7b, magnesium is abundant in the bedrock formations of the area and due to the shallow bedrock depth at the Site, it is expected the soils would contain a higher content.	No changes made

	October 16, 2020 MECP Comment	Jacobs Response	Document Location
		- Strontium concentrations above the OTR were found at 7 samples from 6 locations (from a total of 43 samples collected) with concentrations between 100 and 190 ug/g above the 87.5 ug/g value. Two of these were from backfill samples, again suggesting a natural variability in the soils of the area. Across Canada, the average strontium concentration in soil is reported as 207 ug/g (Health Canada, 2019; *Guidelines for Canadian Drinking Water – Guideline Technical Document – Strontium* [https://www.canada.ca/en/health-canada/services/publications/healthy-living/guidelines-canadian-drinking-water-quality-guideline-technical-document-strontium.html]). Strontium is also associated with limestone (which is the bedrock in the region of the Site). Based on the low proportion of samples reported at concentrations greater than the OTR, that all the concentrations reported at the Site are lower than the Canadian soil average, and that strontium is not specifically known to be associated with past site activities; strontium is not considered a COC and the concentrations present onsite do not limit the use of the property. Additionally, the QPESA is of the opinion that the assessment of contamination at the Site would be better represented by the distribution of other metals found as a result of historical activities, and that any risk that may be present from the unassessed parameters would be mitigated with the selected RMMs. Based on this information, along with that presented in Table 6-7b of Appendix D2, the QPESA is of the opinion, that screening out the parameters as COCs is appropriate.	
2	Sections 4.1.2.1 and 4.1.2.2 – Soil and groundwater component values used for the secondary screening should be provided in Tables 4-1 and 4-2.	The screening levels used are included in the appendix. Tables 4-1 and 4-2 are intended to be summary tables. A footnote has been added to Tables 4-1 and 4-2 to indicate that the full screening tables (including comparison of concentrations to component values) can be found in Appendix F.	Table 4-1 Table 4-2
3	Sections 4.1.2.1 and 4.1.2.2 – The process of selection of COCs in soil and groundwater for the trench air inhalation pathway for construction and utility worker receptors should be discussed in these sections.	The process for the selection of COCs for the trench air inhalation pathway is the same as the process described in these sections for indoor and outdoor air. Trench air is included under the umbrella of "outdoor air". Text clarifying that the screening process for outdoor air includes trench air has been added to Sections 4.1.2.1 and 4.1.2.2.	Section 4.1.2.1 Section 4.1.2.2
4	Section 4.2.2 (Figure 4-1) – Groundwater ingestion (potable water) should be shown as a complete pathway for the indoor worker receptor in Figure 4-1 based on discussions provided in Section 4.2 and Table 4-13. Similarly, incidental groundwater ingestion should be shown as a complete pathway for the off-site construction/utility worker receptors in Figure 4-1 based on discussion provided in Section 4.2 and Table 4-13.	Agreed. Figure 4-1 (HH CSM) was checked against Table 4-13; the following revisions were made: • Groundwater – Ingestion and Dermal Contact – Indoor Worker changed to Qualitative; Offsite Construction Worker changed to Qualitative • Groundwater – Inhalation and Dermal – Offsite Construction Worker and Utility Worker changed to Incomplete The figure edits do not impact the results or conclusions of the RA, as the receptor-pathway combinations were assessed per Table 4-13. Also, in response to PSF Comment 3b (above), the presence of NAPL at the Site has been noted on Figures 4-1 and 4-2.	Figure 4-1 Figure 4-2
5	Section 4.3 – Subchronic TRVs were provided in Table 4-26 for some chemicals; however, it is not clear if the subchronic TRVs were used for estimation of risks for any of the receptors. Further, for some parameters more than one TRV was provided in Table 4-26 (e.g., SF and URF for vinyl chloride) and it is not clear if different TRVs were used for the estimation of risks for some receptors in the RA (e.g., composite receptor vs adult/toddler receptor). Clarification should be provided in Section 4.3.	Text has been added to Section 4.3.2 to clarify where sub-chronic TRVs and the SFs/URFs for vinyl chloride were applied to for the evaluation of risks.	Section 4.3.2
6	Section 4.4.3.2 – It is unclear why the potential for risks to offsite receptors via the migration of soil gas is considered low. Supporting information should be provided and discussed here for potential offsite migration of volatile impacts in groundwater as well as lateral migration of soil gas from onsite soil to the nearby offsite buildings.	Additional discussion has been added to Section 4.4.3.2. It has been acknowledged that there is potential for offsite risk due to vapour from the migration of groundwater. RMMs are proposed to mitigate risks to receptors in offsite buildings from groundwater migration by proposing trigger concentrations in shallow wells at the perimeter of the RA Property at concentrations that consider the indoor air pathway. The QPRA has also discussed this comment with the Guelph District Engineer; the currently proposed RMMs (that is, groundwater monitoring to address the potential for offsite inhalation risks via groundwater migration) are considered sufficient.	Section 4.4.3.2
7	Section 4.4.5 – The text in this section can be interpreted to imply that Section 43.1 of the Regulation also applies due to the presence of water bodies within 30 metres of the site, which was likely not the intent. The Reviewer notes that it is indicated in Section 5.1.1 that there is no surface water or aquatic habitat within 30 metres of the RA property. The text should be clarified accordingly.	The text in Section 4.4.5 has been clarified with respect to the applicability of the other conditions mentioned under Sections 41 and 43.1 of O. Reg. 153/04.	Section 4.4.5

	October 16, 2020 MECP Comment	Jacobs Response	Document Location
8	Section 4.4.6 – Further information should be provided on the basis for assessing some COCs in groundwater as potentially mobile, and others not.	A footnote and reference has been added to Section 4.4.6 to clarify the general process for evaluating the mobility of COCs in groundwater.	Section 4.4.6
9	Section 5.2.2 –It is unclear that potential habitat for all reptiles and amphibians would not be present at the site given the vacant nature of the property and the extent to which portions of the site have become re-naturalized. The Reviewer acknowledges that exposure and toxicity information is less available for reptiles and amphibians, but if the receptors in these categories may occur at the property, then they should be assessed qualitatively to the extent possible (i.e., in Section 5.5.3), and any limitations in the approach discussed in the uncertainty assessment (as was done for off-site receptors in this category).	Section 5.2.2. has been revised to acknowledge the potential for reptiles to be onsite. Due to the Site conditions and lack of nearby water bodies/surface water, amphibians are not anticipated to be present onsite. Section 5.5.3.2 was added to qualitatively assess the potential risks to reptiles onsite based on the quantitative assessment of other onsite ecological receptors. It is assumed that the RMMs implemented for other ecological receptors will afford protection to reptiles, if present. The existing text included an uncertainty with regards to onsite reptiles, which was updated to be consistent with the revised qualitative assessment for onsite reptiles (Section 5.5.7).	Section 5.2.2 Section 5.5.3.2 Section 5.5.7
10	Section 5.3.1 – It is indicated in this section that groundwater effects on birds and mammals were not assessed. Considering the shallow groundwater depth at the Site, potential indirect exposure to groundwater for mammals and birds via terrestrial plants may be possible. Clarification is required.	The RA has been revised to qualitatively assess the indirect effects from groundwater on birds and mammals via diet (vegetation) in the context of the results to terrestrial plants.	Section 5.3.1 Section 5.5.3.3
11	Section 5.5.2.2 – The following comments are provided:	--	--
	a. The presence, or potential presence, of NAPL is inconsistent with the determination that the HQ for PHC F3 and F4 would be less than one (i.e., the assumption that F3 and F4 are insufficiently soluble to result in concentrations that would be sufficiently elevated to pose a concern is obviated by the presence of NAPL). Further consideration of this issue is required.	Acknowledged. The HQs for PHC F3 and F4 has been revised to be "assumed" greater than one due to the presence of petroleum-related NAPL at the RA Property. Section 5.5.2.2 and Tables 5-7a and 5-9 have been revised to reflect this assumption with respect to terrestrial plants. This change did not impact the results or conclusions of the assessment for these receptors. Per Section 3.2.1 NAPL mobility offsite is not expected; therefore, no changes were made with respect to the conclusions for potential risks to offsite aquatic receptors (Table 5-12). A table reference typo was corrected in the footnotes of Table 5-12.	Section 5.5.2.2 Table 5-7a Table 5-9 Table 5-12
	b. The Reviewer agrees that rooting zones may be shallower than 1.5 metres for many types of vegetation, but this would not necessarily be true for some types of vegetation, notably mature trees. Further consideration of this issue is required relative to potential risks and RMMs that may apply to mature trees.	The City has indicated that based on current plans for the Site, none of the mature trees at the Site, which are not planted species but have resulted from the vacancy of the Site, will remain following development. Therefore, Detail 2 as depicted in Figure I-3 will not be applicable as part of the future development and has been removed. For new trees, now Figure I-3, text has been added to further direct that the future Landscape Architect (LA) select species less prone to deep root systems and more tolerant of urban environments with respect to soil quality and groundwater uptake. As per the notes on Figure I-3, the LA can specify a deeper barrier thickness as required. The average depth to groundwater across the Site in the shallow wells is 2.07 mbgs. Depth to groundwater less than 1.5 mbgs has been noted on multiple occasions (greater than 20%) at only two shallow well locations across the RA Property (OW02 and OW22S) between 2010 and 2020 of the 56 shallow wells installed at the Site. These two wells are located in the northeastern portion of the Site. See additional discussion regarding distribution of contaminants and risk to terrestrial vegetation in Section 5.5.2.2 of the RA. It has been concluded that there are low potential risks to mature trees as a result of potential contaminated groundwater uptake (specifically PAHs, PHCs and zinc) and that the limited risk can be further managed through appropriate species selection and this requirement has been added as a Land Use Restriction (Section 7.2.3.4). Additional risk due to soil can be managed through use of a deeper fill cap as recommended by an LA for proposed tree planting areas.	Section 5.5.2.2 Appendix I, Figure I-3 Section 7.2.3.4 Table 7-4
	c. Thin fill cap has been recommended in the RMP for the existing mature trees that will remain onsite following site redevelopment. A discussion of the locations of these trees with respect to the areas with shallow groundwater should be provided.	As indicated, it is not anticipated that any of the existing trees will remain following development. See discussion above with respect to shallow groundwater. It is expected that the existing trees that have naturally established at the RA Property during its history of vacancy can remain in place in the interim and risk to these trees until development proceeds is low. The existing trees appear to be healthy and well established.	Detail 2 has been removed from Figure I-3
12	Section 5.5.5 – The text in this section can be interpreted to imply that Section 43.1 of the Regulation also applies due to the presence of water bodies within 30 metres of the site, which was likely not the intent. The Reviewer notes that it is indicated in Section 5.1.1 that there is no surface water or aquatic habitat within 30 metres of the RA property. The text should be clarified accordingly.	The text in Section 5.5.5 has been clarified with respect to the applicability of the other conditions mentioned under Sections 41 and 43.1 of O. Reg. 153/04.	Section 5.5.5

	October 16, 2020 MECP Comment	Jacobs Response	Document Location
13	Section 6.3 – It is unclear from the discussion provided whether potentially recoverable NAPL may be present at the property. It is the Ministry's expectation that NAPL will be recovered to the extent practicable. Additional discussion is warranted for completeness.	As discussed in the response to PSF Comment 3a, the LNAPL is present within the highly fractured bedrock contact zone, and recovery is considered not feasible as the process would be difficult, costly and inefficient. Additional discussion has been provided in Section 6.3 to expand on this discussion.	Section 6.3
14	Section 6.4 and Table 6-3 – It is unclear if the fill cap concentrations take into consideration all the applicable component values and relevant exposure pathways (e.g. S-Nose, inhalation from a trench scenario, etc). This should be clarified.	A check of the fill cap concentrations compared to the S-Nose and trench RBCs was completed, see additional text below. Statements regarding whether the fill cap concentrations are protective of these pathways have been added to the text. **S-Nose** The development of the S-nose component value is derived from a scenario where a gardener receptor smells a handful of soil while gardening. As extensive gardening activities are not expected at the RA Property (that is, gardening of home-grown produce is prohibited except in above ground containers/containerized plots and other gardening activities would be limited to ornamental gardens in landscaped areas), the application of the S-Nose component value in the selection of Fill Cap Target Concentrations (FCTCs) is considered overly conservative for the anticipated redevelopment scenario. A qualitative assessment of the soil odour pathway has been added to Section 4.4.3.9, which assesses and identifies the potential for (aesthetic) risks from this pathway, and identifies the need for RMMs to mitigate the potential odour issues. To be protective of potential odour concerns, text has been added to Section 7 noting that soil to be used as part of the cap needs to be meet the FCTCs as well as pass visual and olfactory inspection (that is, no sheen, staining, odour, or mixed debris). The text in Section 6.4 has been revised to reflect this information. **Trench Inhalation** The FCTCs (Table 6-3) were compared to the Trench RBCs (Table 4-46) to determine if the FCTCs were protective of the trench inhalation pathway. Where the trench air pathway risk was driven by groundwater, the RBCs were calculated only for groundwater in Table 4-46; therefore, the revised RA has calculated the soil RBCs for both 2-(1-)Methylnaphthalene and PHC F2 (which are soil COCs with trench air risks driven by groundwater concentrations). The soil RBCs associated with these COCs have been added to the footnotes of Table 4-46 and 7-2f, and were subsequently checked against the FCTCs in Table 6-3. The derived soil RBCs for the trench air pathway are higher than the associated FCTCs for each chemicals (refer to the comparison in Table A3-1 in Appendix A3). Therefore, Jacobs can confirm that the FCTCs are protective of the trench air pathway. The text in Section 6.4 has been revised to reflect this information.	Section 4.4.3.9 Table 4-46 (footnote) Section 6.4 Section 7.2.2 Section 7.2.3.2 Table 7-2f (footnote) Appendix A3, Table A3-1
15	Appendix D – A rationale for and description of any hydrogeological and geological interpretations which differ from assumptions on which the Soil, Ground Water and Sediment Standards are based is required to be included with the ESA summary.	A rationale and description of the interpretations has been added to the Phase Two ESA Summary in Appendix D2.	Appendix D2
Risk Management			
1	For areas where NAPL has been observed, consideration needs to be given to including a provision in the RMP for prohibiting the construction of buildings with basements or other occupied below grade structures in these areas for as long as the NAPL remains present in these areas. Please contact the District Office to discuss prior to resubmission.	Additional requirements have been added to restrict below grade occupied spaces within a specific area of the Site (potential NAPL), unless it is demonstrated that NAPL has been removed through focused pre-development remedial activity. An addition to the requirements in the SGMP has also been made requiring soils considered for reuse beneath the fill or hard cap, must meet the free-phase thresholds (FPT) for PHC F2, F3 and F4, as per Table 6-2a.	New Figure 7-2 Section 7.2.3.5
2	Should slab-on-grade buildings be constructed in the areas where residual NAPL remains, additional design considerations/details are required to be provided in Appendix I.2 as it relates to the presence of NAPL and the conceptual vapour mitigation systems as proposed.	Jacobs has reviewed the proposed vapour mitigation for slab-on-grade buildings presented in Appendix I and has determined that the proposed mitigation is considered appropriate for within the area shown in new Figure 7-2. The components of the identified NAPL are primarily PHC F3 and F4 with a lesser component of PHC F2 and therefore has limited volatility. The proposed slab-on-grade conceptual design will include monitoring and must allow for the conversion of the passive system to an active system. The contingency will be adequate to address any increased risks due to vapours results from the presence of NAPL below a future building. Statements have been added regarding material compatibility in Appendix I.	No change Section I.2.1 Section I.2.2.2
3	Imported "Unimpacted Soil" as defined in Section 7.2.2 of the Risk Assessment and related sections in Appendix I includes a reference to O. Regulation 406/19 and the Rules for Soil Management and Excess Soil Quality Standards. These references need to be removed as a Risk Assessment under O. Regulation 153/04 (as amended) is being undertaken and the issued CPU will take precedence. As such, any imported "Unimpacted Soil" must meet the applicable generic site conditions	Noted, these references have been removed from Section 7 and Appendix I.	Section 7 Appendix I

	October 16, 2020 MECP Comment	Jacobs Response	Document Location
	standards for this property as identified in the Risk Assessment (i.e. Table 6 SCS). This reduces confusion and uncertainty. Please contact the District Office directly to discuss prior to resubmission.		
4	Section 7.2.3.1: The HSP requirements need to include consideration of the potential risks associated with dust, soil/groundwater vapour and the presence of NAPL.	Section 7.2.3.1 has been revised to account for the pathways mentioned.	Section 7.2.3.1
5	Section 7.2.3.2 needs to include the following: • Management measures and an action plan (including appropriate disposal options) for NAPL if encountered. If NAPL is encountered, notification to the Director in writing within 24 hours of the NAPL being encountered.	These provisions have been added to Section 7.2.3.2 and 7.2.3.3	Section 7.2.3.2 and 7.2.3.3
6	If buildings with basements are not prohibited, as recommended in 1.0 above, Section 7.2.3.3 will need to be updated to include provisions for the presence of NAPL.	See response to Comment 1 above. Buildings with basements are prohibited until it can be shown that NAPL has been removed. Section 7.2.3.3 has been updated to account for the management of NAPL should it be encountered during construction excavation anywhere on the RA Property.	Section 7.2.3.3
7	Section 7.4.1 needs to be updated to include timelines for notification requirements to the Director. Typical timelines are included below for reference and will be modified and incorporated into the CPU as warranted. • *In the event that the indoor air and or sub-slab vapour monitoring program identifies one or more of the Target Analytes at concentrations above the Target Indoor Air/ Sub-Slab Vapour Target Concentrations in **Table 1XXX**, respectively, and where the concentrations of the observed Target Analytes are determined by the qualified Licensed Professional Engineer to be a result of soil vapour intrusion, the Owner shall implement the contingency measures detailed in Section XXX of the RA and as follows:* i. *Written notice shall be submitted to the Director by the Owner within 14 calendar days of the Owner's receipt of the laboratory analysis. This written notice shall include the indoor air and or sub-slab vapour sampling results (as necessary), the laboratory certificates of analysis and the anticipated timeline for the implementation of the confirmatory sampling program along with any additional work as may be deemed necessary by a qualified Licensed Professional Engineer. Confirmatory sampling shall occur within 14 calendar days from the date of the Owner's receipt of the laboratory analysis and be completed by a qualified Licensed Professional Engineer.* ii. *In the event that the confirmatory indoor air and or sub-slab sampling verifies the exceedances of one or more of the Target Analytes concentrations above the Target Indoor Air Concentration/Target Sub-slab vapour Concentrations in Table 1XXX, the Owner shall:* a. *Submit written notice to the Director within 14 calendar days of the Owner's receipt of the laboratory analysis. This written notice shall include the confirmatory indoor air and or sub-slab vapour sampling results, the laboratory certificates of analysis and the details of, and the anticipated timeline to implement contingency measures consistent with Section XXXX of the RA along with the implementation of further evaluation/assessment of the vapour mitigation system as may be deemed necessary by a qualified Licensed Professional Engineer. The implementation of contingency measures, along with the implementation of a confirmatory indoor air sampling program shall occur within 14 calendar days of the Owner's submission of the written notice of the exceedance to the Director;* b. *Within 30 calendar days of the implementation of the contingency plan, the Owner shall submit to the Director an update report prepared by a qualified Licensed Professional Engineer documenting the implementation of contingency measures, results of the implementation of the confirmatory indoor air sampling program along with the details and timelines for the implementation of performance indoor air and or sub-slab vapour monitoring program. The update report shall include, but not be limited to:* i. *Laboratory results and laboratory certificates of analysis;* ii. *Field logs, leak testing (as necessary) and documentation of QA/QC;* iii. *Discussion and interpretation of the results in comparison to the respective Target Indoor Air Concentrations as listed in Table 1XXX; and,* iv. *Conclusions and recommendations with respect to the performance of the vapour mitigation system along with the need for additional work and/or continued monitoring as may be deemed warranted.*	Timelines have been added to Section 7.4.1. consistent with current CPU requirements.	Section 7.4.1.1
8	Section 7.4.3.1 – The groundwater monitoring program needs to include groundwater monitoring wells OW24S/D and OW13-39S/D to monitoring COCs coming onto the property and ensure that they do not exceed the PSS. Further, although the MECP is actively pursuing the identification of the off-site source of the contamination in this area of the property, no Provincial Officers Order has been issued to date. Please update this section accordingly.	Monitoring wells OW24S/D and OW13-39S/D have been added to the groundwater monitoring program for comparison of results to the PSS only. The Financial Assurance text (Section 7.5.2) and table (Table 7-12) have been updated to account for the costs of sampling from four additional monitoring wells.	Section 7.4.3.1 Section 7.5.2 Table 7-9 Figure 7-2

	October 16, 2020 MECP Comment	Jacobs Response	Document Location
			Table 7-12
9	Section 7.4.3.1 – The groundwater monitoring well network should be updated o include the measurement of NAPL in at least one or two key wells within the areas identified as having residual NAPL. Further, should an increased thickness be observed, passive removal (i.e. use of absorbent pad/socks) or active removal should be triggered along with notification to the Director.	This provision has been added to the groundwater monitoring program. Wells OW23S, MW17-108S, and MW18-135S have been added to the groundwater monitoring program.	Section 7.4.3.1 Table 7-9 Figure 7-2
10	Appendix L, Figure I-9 – There was no discussion provided in regards to this figure. Please update this section accordingly.	The references in the Appendix I have been updated. This Figure was no longer required as no designs for unoccupied structures were proposed as part of this RA.	Appendix I

Notes:

APEC = area of potential environmental concern
CCME = Canadian Council of Ministers of the Environment
City = City of Guelph
COC = contaminant of concern
CSM = conceptual site model
ERA = Environmental Risk Assessment
ESA = Environmental Site Assessment
HH = human health
HSP = health and safety plan
HQ = hazard quotient
LNAPL = light non-aqueous phase liquid
MECP = Ontario Ministry of the Environment, Conservation and Parks
NAPL = non-aqueous phase liquid
OTR = Ontario Typical Range
PGMIS = Provincial Groundwater Monitoring Information System
PHC = petroleum hydrocarbon
PSF = pre-submission form
P2 = Phase Two
QP = Qualified Person
RA = Risk Assessment
RSC = Record of Site Condition
RMM = risk management measure
RMP = risk management plan
SCS = site condition standard
SF = slope factor
TRV = toxicity reference value
URF = unit risk factor
VOC = volatile organic compound

[a.] Obtained from Table 4-43 of this RA report.

[b.] Obtained from Table 5-13 of this RA report.

[c.] Ontario Regulation 153/04, Table 6: Generic Site Condition Standards for Shallow Soils in a Non-Potable Ground Water Condition (coarse-textured soils) (MECP, 2011).

[d.] Maximum concentration observed onsite, as shown in Table 4-1.

[e.] Cap Target Concentration is the minimum of the Human Health RBC, Ecological RBC, and observed maximum concentration. If the Cap Target Concentration is less than Table 6 SCS, the Table 6 SCS is selected as the Cap Target Concentration. Direct Contact and Inhalation of vapours originating from soil in the absence of RMMs have been considered in the derivation of the Cap Target Concentrations.

* Units for Electrical Conductivity are mS/cm

Notes:

µg/g = microgram per gram
COC = contaminant of concern
F = fraction
HH = human health
MECP = Ministry of the Environment, Conservation and Parks
mS/cm = milliSiemen per centimetre
RA = risk assessment
RBC = risk-based back-calculation concentration
RMM = risk management measure
SCS = site condition standard
NA = not applicable

Re: Notice of a Circumstance requiring additional information for 200 Beverley Street, Guelph, Ontario (Property)
Risk assessment number 6417-B9XQGZ
TASDB file number RA1748-19b

This is to acknowledge your submission of a risk assessment report on 2021/11/18 regarding the Property to the Ministry of the Environment, Conservation and Parks (Ministry). By way of this letter I am providing you written notice, prior to making a decision under section 168.5 of the *Environmental Protection Act* (the Act), that the Director is aware of the following circumstance:

The content of the risk assessment report does not comply with a requirement specified in section 4 or 5 of Schedule C of Ontario Regulation 153/04.

Due to the above-noted circumstance, this is to request that you:

- revise and resubmit the risk assessment to the Director in accordance with the directions specified below in Schedule A

By way of this letter the Director is providing you notice that a new time to respond to a risk assessment will commence on the date that the Qualified Person submits the revised risk assessment in accordance with this notice.

At any time the owner may withdraw the risk assessment by giving written notice to the Director.

For your information the Act, Regulation, guidance documents and associated fact sheet have been posted on the world wide web at:

https://www.ontario.ca/page/brownfields-redevelopment

Craig Kinch

Director, Environmental Protection Act s. 168.5

SCHEDULE A
To Director's Notice
Comments by the Ministry of the Environment, Conservation and Parks On Risk Assessment
for
200 Beverley Street, Guelph, Ontario
RA1748-19b
IDS Ref. No. 6417-B9XQGZ

The following are Ministry comments on the following Risk Assessment (RA):

- **Revised Risk Assessment Report for 200 Beverley Street, Guelph, Ontario report prepared by Jacobs Engineering Group Inc., dated November, 2020.**

Comments On Risk Assessment

General Comments

The Site is the former International Malleable Iron Company (IMICO) foundry facility with an approximate area of 5.2 hectares. The Site was first developed in 1913 when it was acquired by IMICO and closed in 1989. Demolition of the buildings and removal of various wastes from the Site (including some excavated soil and PCB materials and a large aboveground AST) occurred in 1998/1999. The Site is currently vacant with no on-site operations occurring. The future redevelopment plans at this time are unknown, but may include one or more of residential, parkland, and commercial use.

Several issues have been identified in the site characterization, HHRA and ERA that need to be addressed before the risk assessment can be considered to meet the requirements of O. Reg. 153/04.

Risk levels and property specific standards that are developed in the RA apply only to the subject property. Any assessment of risk or development of property specific standards in the RA that may be intended to apply to off-site properties are beyond the scope of a RA under the Regulation and accordingly are not part of the Ministry's review.

Note that some of the comments included in this document (Schedule A) may be related to the adequacy of the environmental site assessment (ESA) work performed to support the approach and conclusions of the RA. Note that acceptance of the qualified person (QP's) responses on these ESA-related matters is for the purpose of supporting a decision on the RA only; a full regulatory review of the ESAs has not been conducted. The Ministry may undertake a more in depth review of the phase one and phase two ESA reports at the time the record of site condition (RSC) is submitted for filing to ensure that all the regulatory requirements have been met. Information relevant to the phase one and

two ESA reports (e.g., table of areas of environmental concern, the conceptual site models) that is amended as part of the RA should be reflected in updated phase one and two ESA reports prior to submitting RSCs for filing. If the QP_{ESA} has any questions regarding meeting the ESA requirements at the time of RSC filing, it is suggested that they contact Rose Ash of Client Services and Permissions Branch; email: rosemary.ash@ontario.ca

Specific Review Comments

PSF Comments

1. No response was required.

2. The comment was previously addressed.

3. The following responses are provided:
   a. The response is noted.
   b. The response addresses the comment.
   c. Further discussion should be provided on the attempts made to recover free product in this area and to discuss whether active recovery is feasible.

4. The following comments are provided:
   a. The comment was previously addressed.
   b. The response partially addresses the comment. The CCME guideline for tin is actually one of the interim guidelines from 1991 and these do not necessarily offer a similar level of protection to MECP standards or more recent CCME guidelines. The CCME 1991 values actually include both assessment criteria and remediation objectives (with 300 ug/g representing the remediation objective). The assessment criteria for tin is 5 ug/g and this is meant to be representative of either background levels or the analytical detection limit at the time. As such, the assessment criteria would be more comparable to the OTR98 values being applied in this evaluation. The Reviewer is also aware of other investigations where tin concentrations ranging up to approximately 10 ug/g were reasonably evaluated as representing background conditions. As such, the conclusion that the observed tin concentrations at the site could reasonably be considered as being representative of background conditions would appear to be acceptable. The discussion should be updated to reflect such a comparison to background conditions as opposed to comparison to the interim remediation objective.
   c. The comment was previously addressed.
   d. The response does not address the comment. Detected chemical parameters would not be considered to be contaminants at the site if they are present at concentrations consistent with naturally occurring background levels and would not be associated with APECs at the site. A site with a long history of foundry operations with iron

and steel production can reasonably be expected to have a variety of metal contaminants present. Where metals are then detected at concentrations exceeding expected naturally occurring background levels, the reasonable conclusion would then be that the metals are associated with the past site operations. The Reviewer agrees that there is not a great deal of available information on background concentrations of bismuth in soils; however, where such data is available, very low bismuth concentrations (e.g., <1 ug/g) appear to be typical (e.g., North American transect data from USGS: https://pubs.usgs.gov/of/2005/1253/), and this is consistent with other sites in Ontario the Reviewer is familiar with where bismuth has been analyzed. Bismuth should be carried forward as a contaminant for consideration in the RA, where comparison to the TCEQ value referenced previously would be appropriate, and/or other qualitative or semi-quantitative approaches as required. The QP-ESA should also consider whether the existing bismuth dataset is sufficient for delineation purposes.

5. The comment was previously addressed.

6. The comment was previously addressed.

7. The comment was previously addressed.

Risk Assessment

Section 3.0 - Property Information, Site Plan and Geological Interpretation

1. Section 3.3.5 – As indicated in a previous comment, detected chemical parameters would not be considered to be contaminants at the site if they are present at concentrations consistent with naturally occurring background levels and would not be associated with APECs at the site. A site with a long history of foundry operations with iron and steel production can reasonably be expected to have a variety of metal contaminants present. Where metals are then detected at concentrations exceeding expected naturally occurring background levels, the reasonable conclusion would then be that the metals are associated with the past site operations. The Reviewer also notes that metals in general were flagged as potential contaminants at the site by the Phase One ESA.
    a. The response does not address the comment. Iron was clearly used as part of foundry operations at the site and therefore it is very unclear what the basis is for the QP's assertion that it would not be associated with APECs at the site. The Reviewer is also unclear as to what the QP is referring to when speaking of 'nutrient balance' issues and this would require additional context if being used as a line of evidence. Iron should be carried forward as a contaminant for consideration in the RA, where qualitative or semi-quantitative approaches can readily be applied as required. The QP-ESA should also consider whether the existing iron dataset is sufficient for delineation purposes.

b. The response partially addresses the comment. The specific responses relating to phosphorus and strontium are acceptable. For magnesium, and similarly for calcium, these may both also be components used in foundry processes. The fact that these are also present in bedrock formations in the area is not entirely convincing as shallow limestone and dolostone formations are very common in Ontario and would be representative of many of the sites used to establish the OTR98 concentrations. Further rationale should be provided or these should also be carried forward for evaluation in the RA.

Section 4.0 - Human Health Risk Assessment

2. The response addresses the comment.

3. The response addresses the comment.

4. The response addresses the comment.

5. The response addresses the comment.

6. The response partially addresses the comment. The QP is also required to consider and discuss lateral migration of soil gas (i.e., gas migration through the vadose zone) (e.g. 10 m (for biodegradable chemicals) and 30 m (for recalcitrant chemicals)).

7. The response addresses the comment.

8. The response addresses the comment.

Section 5.0 - Ecological Risk Assessment

9. The response addresses the comment.

10. The response addresses the comment.

11. The following comments are provided:
    a. The response addresses the comment; however, the QP is also referred to PSF comment 3.
    b. The response addresses the comment.
    c. The response partially addresses the comment. It is not clear whether or not a fill cap thickness of 150 mm is still recommended as an interim RMM for the existing mature trees until site redevelopment. Table I-1 and its footnote in Appendix I and footnote in Figure I-3 refers to 150mm fill cap for existing trees (Detail 2). Clarification is required.

12. The response addresses the comment.

Section 6.0 – Conclusions and Recommendations

13. Section 6.3 – See PSF Comment 3.

14. The response addresses the comment as pertains to Section 6. However, it is unclear whether the FCTCs take into account ecological pathways (e.g. S-GW3, etc.). This will also need to be addressed, as the proposed RMMs must also be protective of all receptors and pathways. For example, it is noted that the anthracene FCTC is greater than the Table 2 S-GW3 component value.

Other Comments

15. The response partially addresses the comment. A discussion should be provided regarding the applicability of using the Generic Standards considering differences between site-specific and MECP default hydrogeological/geological values (e.g., size of contaminated area, etc.) used in the derivation of the Generic Standards (i.e., if site-specific value is less conservative than MECP default value, why it is appropriate to use Generic Standards for the property).

New Risk Assessment Comments (March 2021)

16. Section 5.4.2 – Site-specific groundwater data were considered in the ERA to directly evaluate parameters exceeding S-GW3 values. A discussion should be provided confirming that adequate groundwater quality data is available in the areas where parameters exceeding S-GW3 values are present in soil to support this approach.

17. Section 5.5.6 – It is indicated in this section that there are potential effects to aquatic receptors from groundwater discharging to downgradient water bodies from anthracene and PHC F2. However, the discussion in Section 5.5.3.4 also identifies PHC F1 and zinc in exceedance of GW3 values. Clarification is required.

Phase Two Conceptual Site Model Comments

Previous comments have been addressed.

Summary and Conclusions

Several issues have been identified in the review of the risk assessment that will need to be clarified before the risk assessment can be accepted under O. Reg. 153/04.

Comments On Risk Management

1 – Figure I-1 needs to be updated to remove the reference to existing trees.

2 – The QP is reminded at barriers to on-site soils are required over the entirety of the property (existing or new). If barriers are not required over the entirety of the property, a figure clearly outlining areas of the property where barriers are not required needs to be prepared and incorporated into the RMP. If the areas are irregular, then a legal survey is required. If not, then please update section 7.2.2, second last paragraph on page 7-5 to specifically reflect that barriers to on-site soils are required over the entirety of the property to avoid any future confusion. Section I.1.2 of Appendix I will also need to be updated accordable.

3 – Please contact the District Office directly to discuss the area of LNAPL restrictions as identified in Figure 7.2 of the RA.

4 – The District Office has had public inquiries into the RA being completed for this property in the past few months. The members of the public have been directed to contact the City to obtain a copy of the RA and that any comments in regards to the RA be provided back to the City to allow the QP to consider the comments within the RA and respond accordingly. Please ensure that all correspondence and consideration of all public comments that have been received by the City be clearly documented and included in an appendix of the next resubmission.

RESUBMISSION

The risk assessment should be revised and resubmitted to the following address:

The Director
Client Services and Permissions Branch
135 St. Clair Avenue West, 1st Floor
Toronto, ON, M4V 1P5

Telephone 416-314-8001

Four hard copies of the risk assessment should be submitted (one marked original), including a stand-alone, electronic copy of the risk assessment report (in USB format). However, if the ministry is still working remotely, then please follow the interim submission process for risk assessments. Please ensure the electronic copy submitted during the interim submission process is a stand-alone document and that all sections within the submission are bookmarked.

To assist MECP in its review of the resubmission, changes to the risk assessment from the version that is the subject of the above review should be outlined in a revision table or errata sheet attached to the resubmission. Use of a redline method in the body of the revised risk assessment also is

recommended, if possible and where practicable.

It also is recommended that the QP_{RA} provide responses to the MECP review comments as an attachment to the submission or as an appendix in the revised risk assessment. This will provide an opportunity for the QP_{RA} to explain to MECP reviewers how the MECP review comments have been addressed in the risk assessment. The QP_{RA} should note that submission of a response to the MECP review comments without a revised risk assessment or addendum is not considered to be a resubmission of the risk assessment under the Regulation and it may not be reviewed.

The Property Owner and QP_{RA} should note that upon receipt and review of the resubmission, the Director may issue a decision under Section 168.5 (1) EPA to accept or not to accept the risk assessment. If the decision is not to accept the risk assessment, then subsequent resubmissions or provision of additional information cannot be accepted by the Ministry for review. Advancement of a risk assessment of the subject property will require submission of a new Pre Submission Form followed by a new risk assessment of the site in accordance with Schedule C of the Regulation.

It is recommended that before resubmission of the risk assessment, the QP_{RA} review the mandatory requirements for risk assessments submitted under the Regulation, as outlined in Section 4 and Table 1 of Schedule C of the Regulation. As well, the Ministry's *Procedures for Use of Risk Assessment Under Part XV.1 of the Environmental Protection Act* should be used for guidance in how to satisfy the requirements of the Regulation. **It is important that the QP_{RA} also confer with the QP_{ESA} to determine whether the PSS provided will support filing of a record of site condition.**

Some of the comments included in this document (Schedule A) may be related to the adequacy of the environmental site assessment (ESA) work performed to support the approach and conclusions of the risk assessment (RA). Note that acceptance of the qualified person (QP's) responses on these ESA-related matters is for the purpose of supporting a decision on the RA only; a full regulatory review of the ESAs has not been conducted. The Ministry may undertake a more in depth review of the phase one and phase two ESA reports at the time the record of site condition (RSC) is submitted for filing to ensure that all the regulatory requirements have been met. Information relevant to the phase one and two ESA reports (e.g., table of areas of environmental concern, the conceptual site models) that is amended as part of the RA should be reflected in updated phase one and two ESA reports prior to submitting RSCs for filing. In addition, if the work on the phase one and two ESA exceeds 18 months prior to the submission date of the RSC, the phase one and two ESA reports will need to be updated prior to submitting RSCs for filing.

If the QP_{ESA} has any questions regarding meeting the ESA requirements at the time of RSC filing, it is suggested that they contact Rose Ash of Client Services and Permissions Branch; email: rosemary.ash@ontario.ca

If the QP_{RA} has questions regarding the application of the Regulation or the above comments, they should be forwarded by email to:

Ann-Marie Deonarine
Risk Assessment Review Coordinator
Technical Assessment and Standards Development Branch
ann-marie.deonarine@ontario.ca

APPENDIX A4

MECP Comments on RA and Jacobs Response to Comments – March 2021

	March 18, 2021 MECP Comment	Jacobs Response	Document Location
PSF Comments			
1	No response required.	No response required.	--
2	The comment was previously addressed.	No response required.	--
3	The following responses are provided a) The response is noted. b) The response addresses the comment. c) Further discussion should be provided on the attempts made to recover free product in this area and to discuss whether active recovery is feasible.	a) No response required. b) No response required. c) Additional text has been added to Section 3.2.1 to document previous LNAPL recovery efforts as part of annual groundwater monitoring programs by AECOM (only 100 – 350 mL recovery reported each event) and specify that active LNAPL extraction was determined not to be feasible due to the depth at which it has been seen (within the bedrock, observed in fractures up to 4.6 mbgs).	Section 3
4	The following comments are provided: a) The comment was previously addressed. b) The response partially addresses the comment. The CCME guideline for tin is actually one of the interim guidelines from 1991 and these do not necessarily offer a similar level of protection to MECP standards or more recent CCME guidelines. The CCME 1991 values actually include both assessment criteria and remediation objectives (with 300 ug/g representing the remediation objective). The assessment criteria for tin is 5 ug/g and this is meant to be representative of either background levels or the analytical detection limit at the time. As such, the assessment criteria would be more comparable to the OTR98 values being applied in this evaluation. The Reviewer is also aware of other investigations where tin concentrations ranging up to approximately 10 ug/g were reasonably evaluated as representing background conditions. As such, the conclusion that the observed tin concentrations at the site could reasonably be considered as being representative of background conditions would appear to be acceptable. The discussion should be updated to reflect such a comparison to background conditions as opposed to comparison to the interim remediation objective. c) The comment was previously addressed.	a) No response required. b) A range of 5 to 9.2 µg/g has been added to Table F-1 as an alternate soil screening value for tin. The following information has been added as a footnote to the table: *For tin, a range has been shown represented by the CCME agricultural value of 5 µg/g (CCME 2020) on the low end; the high end value of 9.2 µg/g is the 98th percentile value of tin based on a soil survey conducted in agricultural soils in Southern Ontario by the Ontario Ministry of Agriculture, Food and Rural Affairs (OMFRA). These values represent the reasonable range of background tin concentrations that could be encountered in Ontario soils. The British Columbia Ministry of the Environment has derived a risk-based value for tin protective of human health of 25,000 µg/g and appears to have adopted the CCME value of 5 µg/g for the protection of ecological health. A search of soil screening values for ecological health on the Risk Assessment Information System (RAIS) website indicates that values between 7.62 µg/g and 2,000 µg/g are generally protective of ecological receptors (7.62 µg/g protective of mammals [masked shrew]; 50 µg/g protective of plants; 2,000 µg/g protective of soil microbes; 19 µg/g representing Dutch Background). Therefore, the CCME and background values are considered appropriate to use in the absence of MECP screening values for the selection of COCs. All tin concentrations measured onsite, apart from the maximum concentration are within the 5 to 9.2 µg/g range considered to be representative of "background". The maximum concentration of 9.6 µg/g is within the same order-of-magnitude as the "background" concentration range and could be within range if 20% analytical variability (a typical assumption) is considered. As such, tin was not retained as a COC for the Site.* c) No response required.	Table F-1

	March 18, 2021 MECP Comment	Jacobs Response	Document Location
	d) The response does not address the comment. Detected chemical parameters would not be considered to be contaminants at the site if they are present at concentrations consistent with naturally occurring background levels and would not be associated with APECs at the site. A site with a long history of foundry operations with iron and steel production can reasonably be expected to have a variety of metal contaminants present. Where metals are then detected at concentrations exceeding expected naturally occurring background levels, the reasonable conclusion would then be that the metals are associated with the past site operations. The Reviewer agrees that there is not a great deal of available information on background concentrations of bismuth in soils; however, where such data is available, very low bismuth concentrations (e.g., <1 ug/g) appear to be typical (e.g., North American transect data from USGS: https://pubs.usgs.gov/of/2005/1253/), and this is consistent with other sites in Ontario the Reviewer is familiar with where bismuth has been analyzed. Bismuth should be carried forward as a contaminant for consideration in the RA, where comparison to the TCEQ value referenced previously would be appropriate, and/or other qualitative or semi-quantitative approaches as required. The QP-ESA should also consider whether the existing bismuth dataset is sufficient for delineation purposes.	d) Bismuth has been updated and carried forward as a contaminant for consideration in the RA. Additional bismuth data was obtained from the analytical laboratory from all Phase Two ESA sampling locations (2017 to 2020) collected for metal analysis and was added to the data set to ensure sufficient delineation at the Property. 5	The response addresses the comment.	No response required.	--
6	The response partially addresses the comment. The QP is also required to consider and discuss lateral migration of soil (i.e. gas migration through the vadose zone) (e.g. 10 m (for biodegradable chemicals) and 30 m (for recalcitrant chemicals)).	Additional text has been added to Section 4.4.3.2, examining the specific locations where onsite soil concentrations are greater than the ICC S-IA component (given that no residential homes are located within 30 m of a volatile soil exceedance) and their distance to the property boundary/potential nearest offsite ICC receptor. The conclusions remain unchanged. This comment was again discussed with the MECP District	Section 4.4.3.2

	March 18, 2021 MECP Comment	Jacobs Response	Document Location
		Engineer, and it was determined that no additional RMMs above and beyond those already proposed in the RMP are required for this pathway. A Groundwater Monitoring Program is proposed in the RMP, with contingency measures that include the installation of soil vapour probes as a potential action stemming from the monitoring program as part of the CPU.

12	The response addresses the comment.	No response required.	--
13	Section 6.3 – See PSF Comment 3.	No response required.	--
14	The response addresses the comment as pertains to Section 6. However, it is unclear whether the FCTCs take into account ecological pathways (e.g. S-GW3, etc.). This will also need to be addressed, as the proposed RMMs must also be protective of all receptors and pathways. For example, it is noted that the anthracene FCTC is greater than the Table 2 SGW3 component value.	Section 5.5.8 and Table 5-13 have been updated to include the generic S-GW3 values in the derivation of the fill cap targets for ecological pathways. Five values were revised. The values from Table 5-13 were updated in Table 6-3.	Section 5.5.8 Table 5-13 Table 6-3
15	The response partially addresses the comment. A discussion should be provided regarding the applicability of using the Generic Standards considering differences between site-specific and MECP default hydrogeological/geological values (e.g., size of contaminated area, etc.) used in the derivation of the Generic Standards (i.e., if site-specific value is less conservative than MECP default value, why it is appropriate to use Generic Standards for the property).	The following text has been added to Appendix D2: *Jacobs also notes that the source size of 340 cubic metres for some contaminant groups may be larger than that assumed by the MECP in the derivation of the generic standards; this difference may affect specific component values where source depletion or groundwater transport was assumed. However, the nature of the RA is generally conservative, which may minimize the specific impact that the aforementioned differences may have on the assessment. The use of the MECP SCS and associated component values were considered appropriate for use in the RA for the selection of contaminants of concern and for secondary screening purposes.*	Appendix D2
New Risk Assessment Comments			
16	Section 5.4.2 – Site-specific groundwater data were considered in the ERA to directly evaluate parameters exceeding S-GW3 values. A discussion should be provided confirming that adequate groundwater quality data is available in the areas where parameters exceeding S-GW3 values are present in soil to support this approach.	As stated in Section 5.4.2, the approach taken is supported by groundwater data dating back approximately a decade (2010) from almost 100 monitoring wells across the Site. The figures presented in the Phase Two CSM (Appendix D3) demonstrate the coverage for PAHs and PHCs in groundwater. These figures have been marked up as Figure A4-1 (PAHs) and Figure A4-2 (PHCs) (included at the end of this appendix) to show the locations where acenaphthylene, anthracene, and PHC F2 in soil were detected at concentrations greater than the Table 2 S-GW3 component values. As shown on Figure A4-1 (PAHs), the S-GW3 exceedances on the west side of the Site are randomly distributed with no evidence of associated PAHs impacts in groundwater. On the east side of the Site, the S-GW3 exceedance locations for PAHs are co-located with other PAHs impacts in groundwater; therefore, using	Appendix A4: Figures A4-1 and A4-2

March 18, 2021 MECP Comment		Jacobs Response	Document Location
		the known groundwater quality is an appropriate way to assess and evaluate potential risks to downgradient offsite aquatic receptors from PAHs. As shown on Figure A4-2 (PHCs), the S-GW3 exceedances are all located in an area known to be impacted by PHCs in groundwater. Therefore, the known groundwater quality is an appropriate way to assess and evaluate potential risks to downgradient offsite aquatic receptors from PHCs. As described in Section 5.4.2, the contamination at the Site is from historical sources; therefore, the measured groundwater data is reflective of the past and present potential for contaminant leaching from soil. The GW3 assessment is considered to be more direct and site-specific way of evaluating the potential risks from the Site to offsite aquatic receptors via groundwater flow to a downgradient water body.	
17	Section 5.5.6 – It is indicated in this section that there are potential effects to aquatic receptors from groundwater discharging to downgradient water bodies from anthracene and PHC F2. However, the discussion in Section 5.5.3.4 also identifies PHC F1 and zinc in exceedance of GW3 values. Clarification is required.	PHC F1 and zinc were inadvertently omitted from the introductory paragraph for the bullets in Section 5.5.3.4, but the details of the GW3 exceedances were provided in the bullets. The introductory paragraph has been revised to also list PHC F1 and zinc as having GW3 exceedances. The mention of a "site-specific GW3" was also deleted in this paragraph, since the assessment utilized the generic MECP GW3 values. The same text as above was repeated in Section 5.5.6, this text has also been revised, per the changes described above.	Section 5.5.3.4 Section 5.5.6
Phase Two CSM Comments			
--	Previous Comments have been addressed.	No response required.	--
Risk Management			
1	Figure I-1 needs to be updated to remove the reference to existing trees.	**Figure** I-1 details the hard cap barrier and does not reference existing trees. However, two references to existing trees were located and removed in **Table** I-1. A reference to existing trees was found in the notes on Figure I-3 as well as in the second paragraph of Section I.1.3; these references have been removed.	Appendix I, Table I-1, Figure I-3, and Section I.1.3
2	The QP is reminded that barriers to on-site soils are required over the entirety of the property (existing or new). If barriers are not required over the entirety of the property, a figure clearly outlining areas of the property where barriers are not required needs to be prepared and incorporated into the RMP. If the areas are irregular, then a legal survey is required. If not, then please update section 7.2.2, second last paragraph on page 7-5 to specifically reflect that barriers to on-site soils are required over the entirety of the property to avoid any future confusion. Section I.1.2 of Appendix I will also need to be updated accordingly.	The following statement has been added to Sections 7.2.2 and I.1.: "Upon redevelopment of the RA Property, a physical barrier (either a fill or hard cap) is required across the entire Site." The following statement has been removed in Section 7.2.2 and I.1.2 as it implies that fill caps are only required in specific areas: "…where there are potential risks to terrestrial plants, soil invertebrates, birds, and small mammals…" For any soil to remain in place at the Site as part of the Fill cap, it must be demonstrated that this soil meets the FCTCs as per Section I.1.2.	Appendix I, Sections I.1 and I.1.2 Section 7.2.2
3	Please contact the District Office directly to discuss the area of LNAPL restrictions as identified in Figure 7.2 of the RA.	The District Office has been consulted and the LNAPL restriction area has been reduced to include the region up to the next shallow well with no trace of LNAPL or exceedances.	Figure 7-2
4	The District Office has had public inquiries into the RA being completed for this property in the past few months. The members of the public have been directed to contact the City to obtain a copy of the RA and that any comments in regards to the RA be provided back to the City to allow the QP to consider the comments within the RA and respond accordingly. Please ensure that all correspondence and consideration of all public comments that have been received by the City be clearly documented and included in an appendix of the next resubmission.	The newly received public comments and responses are included as Appendix J2. The previously provided Public Communication materials remain unaltered as Appendix J1. Section 8 of the RA was also updated to reference the new appendix materials.	Section 8 Appendix J2

Notes:

APEC = area of potential environmental concern
CCME = Canadian Council of Ministers of the Environment
City = City of Guelph
COC = contaminant of concern
CSM = conceptual site model

MEMBERSHIPS AND AFFILIATIONS

Member of ECO Canada, Environmental Professional (Site Assessment and Reclamation)

Katherine Appleby, B.E.S.

RISK ASSESSMENT

Katherine Appleby has 14 years of experience in the field of RA and ESA. She has prepared numerous technical reports, including pre-submission forms (PSFs), screening-level risk assessments (SLRAs), and comprehensive RAs. Katherine has experience performing, reviewing, and supervising the completion of both HHRAs and ERAs for land- and water-based sites. Her skills include developing RA conceptual site models (CSMs), selecting ecological and human health receptors, exposure modelling, selecting toxicity reference values, calculating risk estimates, developing risk management measures (RMMs), reporting, performing peer review, and responding to client and regulator comments on RA reports. Katherine has authored, led, or contributed to the completion of over 50 focused, comprehensive, or screening-level RA reports using both provincial (Ontario Ministry of the Environment, Conservation and Parks [Ministry] and Environment Yukon) and federal (Health Canada and Canadian Council of Ministers of the Environment [CCME]) frameworks. She is familiar with provincial and federal environmental legislation, such as Ontario Regulation (O. Reg.) 153/04 (as amended) and the Record of Site Condition (RSC) filing process.

Areas of Expertise

- 14 years of experience in the field of risk assessment (RA) and environmental site assessment (ESA)
- Experience performing, reviewing, and supervising the completion of both human health and ecological risk assessments (HHRAs and ERAs) for land- and water-based sites.

Relevant Project Experience

Confidential Project, Ontario, Canada

Client: AkzoNobel Inc.

Title: Risk Assessor

Start/End Dates: January to March 2017

Scope/Description: Assessed the human health risk from the groundwater-to-indoor-air inhalation pathway related to chlorinated solvents and tetrahydrofuran (an emerging contaminant of concern) at a building currently used for industrial/commercial purposes.

Confidential Project, Ontario, Canada

Client: Confidential Client

Title: Risk Assessor

Start/End Dates: January to March 2017

Scope/Description: Technical lead for the completion of a due-diligence RA (DDRA) report. Assessed the human health and ecological risks in soil, groundwater, sediment, and surface water from contamination associated with historical creosoting operations at a site in northern Ontario. RA reporting was completed in accordance with O. Reg. 153/04 to potentially support a future RSC.

Confidential Project, Ontario, Canada

Client: AkzoNobel Inc.

Title: Risk Assessor

Start/End Dates: August to October 2016

Scope/Description: Author of a technical memorandum documenting the development of generic groundwater criteria for tetrahydrofuran (an emerging contaminant of concern) for the groundwater-to-indoor-air inhalation pathway (for both residential and industrial/commercial land uses). The memo was prepared at the request of the Ministry District Office and reviewed by the Ministry Standards Development Branch. The Ministry endorsed the derived values for application to onsite and offsite properties associated with the project area.

Quantitative Human Health and Ecological Risk Assessment (QHHERA), Old Crow, Yukon

Client: Government of Yukon

Title: Risk Assessor

Start/End Dates: September 2015 to Present

Scope/Description: Assessed the human health and ecological risk associated with historical hydrocarbon contamination in soil and suprapermafrost groundwater at the Nursing Station in Old Crow. Lead author of an SLRA to provide a preliminary evaluation of potential risks at the site. Lead author of the QHHERA, which included the interpretation of toxicity studies to determine the effects of hydrocarbon on the site's northern plants and soil invertebrates. The QHHERA was completed using Yukon, BC, CCME, and Health Canada methodology and will be used to develop remedial strategies and options for the site.

Due-Diligence for the Cornwall Harbour, Cornwall, Ontario

Client: Public Works and Government Services Canada (PWGSC)

Title: Risk Assessor

Start/End Dates: September to December 2015

Scope/Description: Technical Lead for the completion of a DDRA report, including the assessment of both human and ecological health. RA reporting was completed in accordance with O. Reg. 153/04 to potentially support an RSC following the proposed future divestiture of this federal property, managed by Transport Canada. Prepared and presented materials summarizing the results of the DDRA to stakeholders (including the City of Cornwall, First Nations, Transport Canada, and PWGSC).

Greenwich-Mohawk Brownfield, Brantford, Ontario

Client: City of Brantford

Title: Risk Assessor

Start/End Dates: February 2014 to Present

Scope/Description: Technical Lead for the completion of draft RA reports for two sites, including the assessment of both human and ecological health. Supported the development of the draft RA report for one other site and PSFs for all three sites. Reporting was completed to the requirements of O. Reg. 154/04. To meet the City's funding agreement deadlines and develop remedial targets, the draft RAs were

completed on a compressed schedule. Currently supervising the completion of three revised RAs to incorporate the remediated condition of these sites for Ministry review and eventual RSC filing.

Preliminary Quantitative Risk Assessment (PQRA) and Preliminary Quantitative Ecological Risk Assessment (PQERA) for the Wye Marsh National Wildlife Area, Midland, Ontario

Client: PWGSC

Title: Risk Assessor

Start/End Dates: November 2013 to March 2014

Scope/Description: Completed the human health portion of a PQRA to the requirements of HC for a trail area located on federal property, managed by Environment Canada and Climate Change. Tasks included compiling soil data into a database, contaminant screening, risk calculations, and reporting. Provided peer review for the ecological portion of the PQERA.

Sydenham-Pearl Brownfield; Brantford, Ontario

Client: City of Brantford

Title: Risk Assessor

Start/End Dates: June 2013 to February 2017

Scope/Description: Lead the preparation of a PSF submitted for Ministry review to support future RA and RSC filing for an industrial site to be sold and redeveloped for residential/parkland use. Lead the preparation of two draft RA reports to be used to guide risk management and remedial actions. Tasks included identification of contaminants of concern (COCs), identification of potentially complete human exposure pathways, exposure modelling, use of the Johnson & Ettinger Models, calculation of human health and ecological risk estimates, development of property-specific standards (PSSs), and associated reporting. Both RAs have been acknowledged by the Ministry.

West Don Lands (WDL); Toronto, Ontario

Client: Infrastructure Ontario (IO)

Title: RMM Verification Team Member

Start/End Dates: June to December 2011

Scope/Description: The largest brownfield site currently under development in Ontario, this former industrial site will encompass mixed-use residential and commercial development, as well as a substantial parkland component, having served as the Pan American Athletes' Village (PAAV) for the 2015 Pan/Parapan American Games (Pan Am Games). The PAAV housed over 8,000 athletes and coaching staff. This revitalization project involved an aggressive schedule to secure the environmental approvals required in advance of infrastructure and building construction by development partners. Site characterization, RA, remedial option feasibility studies (ROFSs), remediation, and RMMs are key project components. Jacobs conducted field investigations and prepared multiple Phase One and Phase Two ESA, ROFS, and RA reports in parallel to meet the development schedule. The reports complied with O. Reg. 153/04 under the *Environmental Protection Act*, as amended by O. Reg. 511/09, such that RSCs will be obtained on properties prior to development. Currently, Jacobs is acting as the third-party Ministry Qualified Person (QP) to audit compliance with the Certificates of Property Use (CPUs) and RAs during the implementation of the RMMs.

In October 2011, the WDL project was selected by the Canadian Urban Institute for the ***2011 Brownie Award*** as the project that best demonstrated ***Excellence in Project Development at the Neighbourhood Scale***. The annual Brownie Awards program recognizes leadership, innovation, and environmental sustainability in brownfield redevelopment across Canada.

As part of the RMM Verification team, performed quality assurance (QA) and quality control (QC) audits on received data, and compared constituent concentrations to RA-determined PSSs and Ministry Soil Cap Standards, as appropriate. Worked under the direction of the RMM Verification Coordinator to review documents and information from IO and other stakeholders to facilitate RMM verification and produce reportable documents (technical memorandums and other documents, as required).

RA and Risk Management Plan (RMP) for 55 Ontario Street, Kingston; Kingston, Ontario

Client: PWGSC

Title: Risk Assessor

Start/End Dates: November 2011 to August 2012

Scope/Description: Assisted with the development of a sampling and analysis plan (SAP) to bring the intrusive investigation reporting for the site up to date with the requirements of the revised provincial O. Reg. 153/04 for potential RSC filing for this federal property, managed by PWGSC. Tasks included compilation of soil and groundwater data into a database, contaminant screening, risk calculations, and reporting for both the ERA and HHRA portions of the RA report.

Contaminated Sediment Assessment for the Kingston Dry Dock; Kingston, Ontario

Client: PWGSC

Title: Risk Assessor

Start/End Dates: August 2011 to March 2012

Scope/Description: Assessment involved the evaluation of multiple lines of evidence related to sediment quality (including sediment chemistry, sediment toxicity, and the benthic invertebrate community) following the Canada-Ontario Decision-Making Framework for Assessment of Great Lakes Contaminated Sediments.

IO; Toronto, Ontario

Client: WDL

Title: HHRA and ERA Team Member

Start/End Dates: May to August 2010 and January 2011

Scope/Description: As a HHRA and ERA team member, responsible for ensuring the RA reports were completed with a high level of quality. Contributed to numerous technical aspects related to the development of the RA(s), including the completion of PSFs, identification of COCs for an environmentally sensitive site using Table 1 Site Condition Standards (SCS), automation of risk calculations, performance of risk calculations, development of PSSs, and implementation of various QC procedures. Also participated in the comment resolution process, ensuring client comments were appropriately addressed in the final products.

RA and RMP for the York Community Centre; Toronto, Ontario

Client: City of Toronto

Title: Risk Assessor

Start/End Dates: January 2010 to September 2013

Scope/Description: Lead author of an RA for the re-development of City-owned land to a community centre. Tasks included preparing a PSF, contaminant screening, compiling toxicity data, performing pathway analysis and risk calculations, and reporting for the HHRA and ERA. The RA was acknowledged by the Ministry.

RA and RMP for Port Stanley Harbour; Port Stanley, Ontario

Client: PWGSC

Title: Risk Assessor

Start/End Dates: March 2009 to January 2011

Scope/Description: Completed two RAs for the federally-owned Port Stanley Harbour, one each for the land-based portion of the site (assessing soil and groundwater) and one for the water lot portion (assessing sediment and surface water). Tasks included preparing a PSF, managing the database, contaminant screening, performing pathway analysis and risk calculations, and reporting for the HHRA and ERA sections within each RA. Prepared and presented materials to the public in two public information sessions as a part of the wider area of abatement designation for Port Stanley Harbour.

Environmental Consulting Standing Offer; Canadian Forces Base (CFB) Suffield, Alberta

Client: Defence Construction Canada (DCC)

Title: Risk Assessor

Start/End Dates: 2009

Scope/Description: Performed a technical review of historical reports related to HHRA and ERA, which evaluate chemical warfare agents and conventional contaminants at the experimental proving ground at CFB Suffield. The review was completed to develop project understanding and identify data gaps for additional investigations.

SLRA for Gods Lake Mine; Elk Island, Manitoba

Client: Mines Branch, Manitoba Science, Technology, Energy and Mines

Title: Risk Assessor

Start/End Dates: 2009 to 2010

Scope/Description: Assisted in the preparation of an SLRA for the Gods Lake Mine Site. Tasks include contaminant screening, risk calculations, and reporting for the HHRA and ERA. The results of the RA will be used to guide risk management actions through the development of a mine closure plan.

Aquatic RA; Ontario

Client: Confidential Client

Title: Risk Assessor

Start/End Dates: 2008 to 2010

Scope/Description: Conducted RA reporting to assess the effectiveness of stream rehabilitation work at a former manufacturing facility where investigations indicated that polychlorinated biphenyls (PCBs) were migrating offsite and that they were biologically available and may be having an adverse effect on the aquatic ecosystem within a local creek (sediment, surface water, and aquatic biota).

RA at Former Epton Facility; Kitchener, Ontario

Client: Confidential Client

Title: Risk Assessor

Start/End Dates: February 2007 to September 2009

Scope/Description: Completed revisions to the HHRA to address Ministry reviewer comments. Tasks included contaminant screening, pathway analysis, risk calculations, and reporting for the HHRA for an

industrial site. The Parcel 1 RA and RSC were acknowledged by Ministry. RAs for additional parcels are being considered.

RA and RMP for Don Valley Brickworks; Toronto, Ontario

Client: City of Toronto

Title: Risk Assessor

Start/End Dates: September 2006 to January 2009

Scope/Description: Tasks included contaminant screening, compiling toxicity data, pathway analysis, risk calculations, reporting, and drafting for the HHRA. Media assessed included soil, groundwater, sediment, and surface water. Additional tasks included gathering supporting information to facilitate the filing of an RSC. The RA was acknowledged by the Ministry.

Pre- and Post-Closure RAs; Deloro, Ontario

Client: Ministry

Title: Environmental Consultant

Start/End Dates: December 2006 to January 2007

Scope/Description: Assisted in the preparation of the Pre- and Post-Closure RAs for the Deloro Mine Site. Tasks include contaminant screening, risk calculations, and reporting for the HHRA portion of the RA. The results of the RA were used to develop site-specific cleanup criteria and further guide risk management actions.

Wellington Block Development RA; Hamilton, Ontario

Client: Hamilton Health Sciences

Title: Risk Assessor

Start/End Dates: December 2006

Scope/Description: Completed revisions to the HHRA to address Ministry reviewer comments. Tasks included contaminant screening, risk calculations, groundwater fate and transport modelling, and reporting. The RA was acknowledged by the Ministry.

SLRAs for Three Sites

Client: PWGSC

Title: Risk Assessor

Start/End Dates: September to December 2005

Scope/Description: Tasks included compiling toxicity values for COCs at each federally owned site (Fisheries and Oceans Canada), calculating dose assumptions for each exposure scenario, and assisted with report writing.

Jacobs

EDUCATION/QUALIFICATIONS

B.A.Sc., Environmental Engineering, University of British Columbia and University of Northern British Columbia (Joint Program), 2016 Graduation

Alexander Biczok, B.A.Sc

HYDROGEOLOGY

Distinguishing Qualifications

- 16 months of field experience for a variety of environmental monitoring and management programs in the mining and civil services industries
- Environmental engineering experience in the mining, civil services, and oil and gas industries

Relevant Project Experience

Imperial Oil Resources Kearl Project; Groundwater Flow and Contaminant Transport Model, Analysis and Report of Results

Start/End Dates: July – August 2017

Scope/Description: Used groundwater vistas to import and interpret results of a MODFLOW groundwater flow and contaminant transport simulation. Created export profiles of hydraulic head and several contaminant transport profiles. Calculated groundwater and contaminant discharge to river boundaries. Provided text and editing for client report. Wrote a technical memorandum, analyzing results and comparing data to a previous model.

Industrial Wastewater Treatment Plant-Engineering Capstone Design; Prince George, BC

Client: University of Northern British Columbia

Start/End Dates: September-December 2015

Scope/Description: Designed a wastewater treatment plant for an industrial client, which would allow a process stream to be recycled as boiler feed. Analyzed the client's wastewater stream for contaminants of concern, and identified effective treatment solutions for each to meet control objectives. Prepared design specifications for each treatment solution and recommended manufacturers and suppliers. Wrote a full technical report on the project for the client.

Borrow Pit Reclamation Design

Client: Suncor Energy

Start/End Dates: July – August 2015

Scope/Description: Designed a reclamation plan for a material borrow pit at an oil sands facility. Used MineScape (three-dimensional [3D] mapping and computer-aided design [CAD] software) in conjunction with aerial maps and site investigation reports, to identify hazards and reclamation objectives. Designed a new landscape to address slope stability, site drainage and appropriate soil cover. Provided a material balance estimate on soil stockpiles to identify surpluses and shortfalls in cover materials.

Water Conveyance System

Client: Suncor Energy

Start/End Dates: February 2015

Scope/Description: Designed a pump-and-pipe system to transport water across a tailings area. Used MineScape (3D mapping and CAD software) to examine the project area, plan a route, and calculate distance and height requirements. Performed necessary hydraulic calculations to identify the required pump specifications and suitable pipe size. Recommended a pump model and pipe material, based on available suppliers.

Regulation and Permit Assessment

Client: Suncor Energy

Start/End Dates: January – August 2015

Scope/Description: Reviewed current and legacy permits related to site activities and disturbed areas, in preparation for new closure plan submissions. Identified closure requirements from permits and organized them to be incorporated into new reclamation and closure work. Undertook document control work to ensure long-term accessibility of documents.

Boundary Bay Environmental Sampling Program

Client: Metro Vancouver

Start/End Dates: November 2014

Scope/Description: Carried out a water sampling program at offshore locations around the Metro Vancouver region. Prepared sampling equipment and material before field work began. Collected water samples from the surface and at depth, and took field measurements of water quality. Recorded results to environmental database software.

General Environmental Sampling; Northern Ontario

Client: Goldcorp Canada – Musselwhite Mine

Start/End Dates: 2011-2013 (May to August, each year)

Scope/Description: Responsible for a variety of field sampling and monitoring programs, including for mine tailings water, surface water, groundwater, offshore, acid rock drainage, dust, noise, and tailings dam stability. Collected samples and used field instruments to take in situ readings, where appropriate. Prepared sample equipment and materials before scheduled sampling days, and maintained inventory of equipment. Performed some in-house lab tests on water quality. Operated trucks, boats and all-terrain vehicles, and was transported in helicopters, to reach sample locations. Remained current on safe operating and work procedures for all field work.

Jacobs

EDUCATION/QUALIFICATIONS

B.A.Sc., Civil Engineering, University of Waterloo, Ontario

REGISTRATIONS/ CERTIFICATIONS

Professional Engineer: Ontario

Jennifer L. Caron

SENIOR PROJECT ENGINEER AND RISK ASSESSOR

As a project engineer with Jacobs, Jennifer Caron has been involved in the management and execution of groundwater and soil cleanup programs for a variety of industrial and municipal clients for over 25 years. She has extensive experience in contaminant hydrogeology, site characterization, and Risk Assessment (RA) projects. Her role in site characterization and RA projects during the past 20 years has been primarily as lead risk assessor as well as report author for Phase One and Two Environmental Site Assessments (ESAs). She is a registered Professional Engineer in Ontario and a Qualified Person under Regulation 153/04 (ESA and RA). She has been responsible for developing the conceptual model, modelling, and exposure and risk characterization calculations, in addition to the evaluation of existing site data, data gap analysis and planning of Phase Two investigations for site characterization projects that have included a variety of contaminants. In addition, she is involved in various aspects of project management including: project scope and project budget development for Phase Two ESAs, RA and remedial programs, field program management and subcontractor and client invoice reviews.

Relevant Project Experience

Former Metal Processing Site, 721 Eastern Avenue, Toronto, Ontario

Client: General Motors of Canada Company

Title: Risk Assessor/Project Engineer

Start/End Dates: 2016 to Present

Scope/Description: Conducting an RA for MECP submittal for a portion of the property to be conveyed to the City of Toronto to facilitate development of the remaining portion of the property for commercial use. Jennifer has been involved in all aspects of the project. Supervised and assisted with the Phase One and Two ESA work across the whole of the Site which was conducted in support of the RA and long-term and development management of the Site, including budget development, project coordination and invoicing. Jennifer also coordinated the submittal of the technical studies required for the Plan of Subdivision and Zoning By-law Amendment Applications to the City of Toronto and ushered these through several iterations of development plans.

Monitored Natural Attenuation Assessment, Tiverton, Ontario

Client: Bruce Power

Title: Project Engineer/Risk Assessment

Start/End Dates: January 2020 to Present

Scope/Description: Jacobs has been assisting Bruce Power with two ongoing remediation projects at two Bruce B sites, referred to as the Bruce B Emergency Generators and the Bruce B Standby Generators since 2011. Our activities have included soil and groundwater investigations to delineate and assess the subsurface impacts as a result of released fuel oil at the sites, evaluation and selection of a mobile pump and treat system at each site, ongoing routine groundwater monitoring, sampling and data evaluation along with reporting and environmental consulting services. Jennifer has recently assisted with the detailed evaluation of site data in order to evaluate the effectiveness of the monitored natural attenuation approach selected for long term remediation at the Site, as well as updating the impact assessment for this approach.

Monitored Natural Attenuation Annual Monitoring Program, 521 King Street West, Kitchener, Ontario

Client: PolyOne

Title: Senior Reviewer

Start/End Dates: 2008 to Present

Scope/Description: Conducted senior review and assessment of data collected as part of an ongoing monitored natural attenuation program to assess movement of chlorinated solvents with groundwater. In 2013 this also included an assessment and presentation of onsite data collected as part of the source area bioaugmentation program.

Legal Counsel, Impacts to Adjacent Property from Chlorinated Solvent Plume, Ontario

Title: Risk Assessor/Project Engineer

Start/End Dates: November 2010 to 2019

Scope/Description: Reviewing other consultants' work and providing professional opinion regarding groundwater impacts and remedial activity associated with chlorinated solvent plume from adjacent property. Remedial activity includes an assessment of natural attenuation and RA. Has developed budget for ongoing work and assists with ongoing management of project.

Groundwater Assessment, Hamilton, Ontario

Client: Union Gas Limited

Title: Risk Assessor/Project Engineer

Start/End Dates: March 2009 to 2015

Scope/Description: Provided project support for a site impacted by historic chlorinated solvent and polychlorinated biphenyl (PCB) impacts. Worked with adjacent property owners to address MECP concerns regarding potential offsite impacts, attenuation of the identified groundwater plume and movement of PCBs in the sewer system. Previously completed 1998 Human Health Risk Assessment (HHRA) for the property. In 2014 assisted with coordination of specific environmental aspects of the decommissioning of the Site, in particular addressing contaminant migration pathways to storm sewers through evaluation of remedial options, cost estimates for work and coordination of subcontractors selected to conduct decommissioning work.

Human Health and Ecological RA, Brantford, Ontario

Client: Union Gas Limited

Title: Risk Assessor

Start/End Dates: January 2008 to 2015

Scope/Description: Conducted an RA at a former coal gasification site under the Ontario Regulation (O. Reg) 153/04. Also conducted an updated Phase I and Phase II ESA for the property including

management of task budgets and coordination of field work associated with ESAs and RA. The primary chemicals of concern included polycyclic aromatic hydrocarbons (PAHs) and benzene, toluene, ethylbenzene, and xylenes (BTEX) and a preliminary evaluation of fate and transport of the chemicals of concern in the groundwater system. Other receptor pathways considered included vapour intrusion and direct contact with soils. RA was been submitted to MECP and involved extensive Risk Management Measures. Also assisted with project management and technical support for focused risk management remedial activities to address contaminant migration pathways through onsite storm sewers.

Phase Two Investigation and Due-Diligence Risk Assessment (DDRA), Cornwall, Ontario

Client: Public Works and Government Services Canada (PWGSC)

Title: Project Engineer/Hydrogeologist

Start/End Dates: January 2015 to February 2016

Scope/Description: Responsible for geological and hydrogeological portions of Phase Two ESA including interpretation of hydraulic conductivity testing and in support of DDRA on large complex Harbour site. Recommended and then directed scope of work for Soil Vapour Investigation (SVI) in support of DDRA and prepared the SVI report.

Phase Two Investigation, Port Stanley, Ontario

Client: PWGSC

Title: Project Engineer/Hydrogeologist

Start/End Dates: January 2012 to March 2013

Scope/Description: Responsible for geological and hydrogeological portion of Phase Two Investigation including interpretation of hydraulic conductivity testing and interactions with surface water in support of Risk Assessment on large complex site on shore of Lake Erie.

Environmental Data Gap Analysis, CFB/ASU Petawawa Range and Training Area 2/DF

Client: Department of National Defence

Title: Project Engineer/Hydrogeologist

Start/End Dates: February to March 2013

Scope/Description: Provided review and hydrogeological/geology input to assist with gap analysis.

Phase Two Investigation, Port Hope, Ontario

Client: PWGSC

Title: Project Engineer/Hydrogeologist

Start/End Dates: March 2013

Scope/Description: Responsible for geological and hydrogeological portion of Phase Two Assessment, including interpretation of hydraulic conductivity testing and interactions with surface water.

Monitored Natural Attenuation Annual Monitoring Program, St. David Street, Kawartha Lakes, Ontario

Client: City of Kawartha Lakes

Title: Senior Reviewer

Start/End Dates: 2008 to Present

Scope/Description: Conducted senior review and assessment of data collected as part of the ongoing monitored natural attenuation program to assess movement of chlorinated solvents with groundwater.

Phase Two Investigation, Port Hope, Ontario

Client: PWGSC

Title: Project Engineer/Hydrogeologist

Start/End Dates: March 2013

Scope/Description: Responsible for geological and hydrogeological portion of Phase Two Assessment including interpretation of hydraulic conductivity testing and interactions with surface water.

Focused Risk Assessment, Kitchener, Ontario

Client: PolyOne

Title: Risk Assessor

Start/End Dates: January to May 2009

Scope/Description: Completed a focused RA to evaluate potential risk from vapours emanating from chlorinated hydrocarbon-impacted groundwater. The objective of this project is to provide a document for the property owner to obtain re-financing of their property.

Publications/Presentations

Presented at 2002 Society for Risk Analysis Meeting in New Orleans, LA. Presentation entitled: Methodology for Evaluating Vapor Transport from Free Phase versus Dissolved Phase PHC Mixtures in the Subsurface and its Significance to Indoor Air Quality.

Presented at 1999 Society for Risk Analysis Meeting in Atlanta, GA. Presentation entitled: Development of Human Health Risk Model and Validation for Indoor Air Exposure to Hydrocarbons.

Jacobs

EDUCATION/QUALIFICATIONS

B.Sc., Wildlife Biology & Conservation, University of Guelph, 2014

Minor in Statistics, University of Guelph, 2014

Dipl., Environmental Technician, Seneca College, 2017

Jennifer (Jenny) Mannisto, B.Sc., Dipl.

ENVIRONMENTAL SCIENTIST

Jennifer is an Environmental Scientist with over 2 years of experience in the environmental consulting industry. Her areas of expertise include environmental assessments, including conducting human health risk assessments (HHRAs), ecological risk assessments (ERAs), and Phase One environmental site assessments (ESAs); data entry and processing; client communication; and writing technical reports. She has prepared numerous technical reports including pre-submission forms (PSFs), Phase I/ One and Phase II/ Two ESAs, groundwater monitoring reports, soil management plans (SMPs), and comprehensive risk assessments (RAs). Her skills include calculating risk estimates, reporting, and data management. She is familiar with provincial and federal environmental legislation, such as Ontario Regulation (O. Reg.) 153/04 (as amended) and the Record of Site Condition (RSC) filing process.

Distinguishing Qualifications

- Experience working in environmental consulting, including report writing, data processing and analysis, and risk calculations for Risk Assessments.
- Excellent communication skills demonstrated through the ability to collaborate with project team members and clients.

Relevant Project Experience

Port Lands Flood Protection and Enabling Infrastructure; Toronto, Ontario

Client: Waterfront Toronto

Title: Technical Support Coordinator, and Junior Risk Assessor

Start/End Dates: September 2017 to present

Scope/Description: The Port Lands Flood Protection and Enabling Infrastructure (PLFP) project is a $1B remediation and redevelopment project in Toronto, Ontario. PLFP will create a new, naturalized river valley at the mouth of the Don River and additional flood protection infrastructure to allow redevelopment of the Port Lands.

Jacobs is working closely with Waterfront Toronto to revitalize the Port Lands through development of the site geo-environmental characterization, environmental site investigation, and risk assessments. Jennifer's involvement with this large scale project is extensive. She runs weekly meetings with the client, works directly with the third parties completing the field investigative work, manages incoming data, and works on various deliverables including PSFs, RAs, Phase Two ESAs, SMPs, risk management plans, and developing strategies for soil reuse, among others. Jennifer has been described as a valued and integral member of the team.

West Don Lands; Toronto, Ontario

Client: Infrastructure Ontario

Title: Environmental Scientist

Start/End Dates: November 2017 to present

Scope/Description: The largest brownfield site development in Ontario, this former industrial site encompasses a mixed-use residential and commercial development, as well as a substantial parkland component, after it served as the Pan American Athletes' Village (PAAV) for the 2015 Pan/Parapn American Games (Pan Am Games).

A certificate of property use (CPU) issued by the Ontario Ministry of Environment, Conservation and Parks (Ministry) identifies specific risk management measures (RMMs) within each RA group. Jennifer has been involved in writing requests for CPU amendments and revoking CPU requirements, a site plan, groundwater monitoring reports, barrier inspection reports, soil vapour reports, as well as writing the annual reports for the RA groups within the West Don Lands (WDL). Some of these deliverables have required data and trend analyses of soil and groundwater quality, data comparison to property-specific standards and MECP site condition standards, and risk evaluation calculations.

City of Toronto Roster; Toronto, Ontario

Client: City of Toronto

Title: Environmental Scientist

Start/End Dates: November 2018 to present

Scope/Description: As part of a Standing Offer agreement with the City of Toronto, environmental consulting services for all scopes and sizes are provided.

Jennifer has completed numerous Phase One/ I ESA reports; developing SMPs, health and safety plans, and barrier inspection plans; working on PSFs and RAs; and completing remediation reports.

Coastal GasLink Pipeline Project; British Columbia

Client: Coastal GasLink

Title: Environmental Scientist

Start/ End Dates: June 2019 to present

Scope/ Description: The Coastal GasLink Pipeline Project is an approximately 670-kilometre natural gas transmission pipeline between the communities of Groundbirch and Kitimat, British Columbia (BC). Coastal GasLink has been concerned about environmental liabilities within the site footprint. Jennifer has completed seven due diligence Phase I ESA reports to date to identify any potential risk of contamination for each of the identified sites. She completed the desktop portion of the reports, including the review of historical reports, information from municipal and provincial databases, and preparing reports.

Third-Party Verification of Greenhouse Gas Emissions; Global

Client: Vermillion Energy Inc.

Title: Data Analyst/ Emission Auditor

Start/ End Dates: February 2019 to July 2019; January 2020 to present

Scope/ Description: Annually, Jacobs conducts a third-party verification of greenhouse gas (GHG) emissions from various sources for Vermilion's Carbon Disclosure Report. The verification provides a limited level of assurance that the reported emissions are reliable and accurate, and are sufficient for its intended use.

Jennifer reviewed the 2018 and 2019 GHG emission inventory and performed a desk-top audit for completeness, transparency, consistency, and accuracy for each of the 8 countries for which data was provided. An assessment of risk in the documentation and a magnitude and sensitivity analysis was conducted on the data.

Cherry Street Stormwater and Lakefilling; Toronto, Ontario

Client: Waterfront Toronto

Title: Environmental Scientist

Start/End Dates: May 2018 to March 2020

Scope/Description: As part of the overall PLFP project, the Cherry Street Stormwater and Lakefilling (CSLF) Project created new landmass around the existing Essroc Quay land through lakefilling in Toronto, Ontario. The new landmass will help to stabilize the area shoreline under flood conditions, as well as improve water quality, optimize water and storm infrastructure, and create new naturalized open spaces and aquatic habitat.

Before importing soil to the site, a third party tested the quality of soil materials from the proposed source sites. Jacobs acted as the receiving site Qualified Person (QP). As part of the Jacobs team, Jennifer evaluated the sample results for approval of importation to the Site. Soil quality was compared to applicable lakefilling standards, while naturally occurring compounds, urban contaminants, biogenic organic compounds, and chemicals pertinent to shallow soil were additional factors that were considered. Additionally, Jennifer documented lakefilling activities and developed a Site Plan for the CSLF Project area.

Plastics Circular Economy; Guam

Client: Guam Environmental Protection Agency

Title: Environmental Scientist

Start/ End Dates: January 2020 to March 2020

Scope/ Description: Jacobs is working with the Guam Environmental Protection Agency (EPA) to develop a plastics circular economy, the goal of which is to eliminate unnecessary plastics, ensure the plastics needed are reusable, recyclable, or compostable, and recirculate those needed plastics within the economy so as to minimize the depletion of resources and materials being sent to landfill. Jennifer was involved in gathering and reviewing information specific to Guam's current recycling situations, including on-island and off-island markets; researching current management systems; reviewing solutions and emerging innovative technologies, and providing recommendations.

George Street Revitalization; Toronto, Ontario

Client: Infrastructure Ontario

Title: Environmental Scientist

Start/End Dates: March 2018 to April 2018

Scope/Description: George Street Revitalization will see the reinvention of the northernmost block of George Street and transform Seaton House men's shelter into a world-class facility providing specialized care for vulnerable populations, including a long-term care home, a transitional living facility, an emergency shelter, affordable housing, and a community hub serving residents of both the site and the local neighbourhood. Jennifer aided in the research and writing of two Phase One Environmental Site Assessment reports in accordance with O. Reg. 153/04, with one being filed to support filing an RSC.

Tania McCarthy

ENVIRONMENTAL SCIENTIST

Tania McCarthy has over 16 years of experience in environmental services, specializing in Phase I and II and One and Two Environmental Site Assessments (ESAs), contaminated site characterization, remedial investigations, Risk Assessments (RAs), and preparation of Records of Site Condition (RSCs) for various sites in Canada. Her experience also includes fill/soil management plans, solid waste management and landfill gas (LFG) projects within Ontario; and site assessments, remediation, and monitoring reports for projects within the United States (U.S.).

Distinguishing Qualifications

- More than 16 years of experience in providing environmental services, including high profile projects
- Involved in Phase One and Two ESAs, Remedial Investigations, RAs, and RSCs under Ontario Regulation (O. Reg.) 153/04, as amended
- Qualified Person for Environmental Site Assessment (QP_{ESA}) under the Ontario Ministry of the Environment, Parks and Conservation (MECP)

Relevant Project Experience

Port Lands Flood Protection and Enabling Infrastructure Project; Toronto, Ontario

Client: Waterfront Toronto

Title: Project Engineer/QP_{ESA}

Start/End Dates: 2015 to Present

Scope/Description: Responsible/Lead for ESA portions of a Community Based Risk Assessment (CBRA) to support the construction of a river valley through the CBRA Project Area (101 hectares within the Port Lands); Environmental Lead/provided senior review on several Conceptual Site Models (CSMs) for PSF/RA submissions and several Phase Two ESA Reports for properties within the Port Lands area requiring eventual RSC filing prior to redevelopment for multiple land uses.

Former IMICo Site, Guelph, Ontario

Client: City of Guelph

Title: Project Engineer and Coordinator

Start/End Dates: 2017 to Present

Scope/Description: Environmental Lead/ Project Engineer for a former industrial site in Guelph, primarily impacted with VOCs in bedrock groundwater, requiring eventual RSC filing to support the change in land use. Involvement included the review and compilation of historical data

for the completion of a Phase One ESA report, the development of the sampling and analysis plans to support the completion of a Phase Two ESA, PSF and eventual RA for the Site, client communication.

Greenwich Mohawk Brownfield; Brantford, Ontario

Client: City of Brantford

Title: Environmental Scientist/Coordinator

Start/End Dates: 2012 to 2014; 2019

Scope/Description: Responsible for the completion of Phase One Site assessments, drafting Phase One and Two ESA reports and preparation of the Certificates of Property Use (CPUs) in accordance with the amended O. Reg. 153/04 on three former industrial properties covering approximately 21 hectares (ha). Tasks involved database management, and coordination of presentations and meetings with the client, and for public information sessions for an industrial site such that RSCs could be obtained on properties prior to redevelopment for multiple land uses. Involved in the review and consolidation of chemical and geological data from numerous historical investigations completed by others to determine data gaps and plan subsequent investigations. The contaminants include benzene, toluene, ethylbenzene, and xylenes (BTEX) and petroleum hydrocarbons (PHCs); volatile organic compounds (VOCs) and heavy metals in soil; and polycyclic aromatic hydrocarbons (PAHs), PHCs, and chlorinated VOCs in groundwater.

Former Calcium Chloride Plant, Amherstburg, Ontario

Client: Amherstburg Land Holdings

Title: Project Engineer and Scientist

Start/End Dates: 2012 to 2018.

Scope/Description: Environmental support for the decommissioning activities on a 300,000-square-foot (ft^2) former chemical production facility. Coordination of groundwater monitoring and reports, delineation investigations, remediation, sampling plans for stockpiles and imported fill. Database management and ESA reporting to support an RA on the property required for potential sale. RA activities also included helping develop a strategy document for submission to the Ontario Ministry of the Environment, Conservation and Parks (Ministry), and supporting RA calculations, data management, and characterization of the property.

Arsenic Impacted Soils Remediation; Windsor, Ontario

Client: Windsor Detroit Bridge Authority

Title: Environmental Lead/QP_{ESA}

Start/End Dates: 2017 to 2018

Scope/Description: Responsible for the development of a data gap assessment, and soils management plan associated with an arsenic impacted soils remediation project of lands associated with the construction of the new Gordie Howe International Bridge. Soil and groundwater at the site and that associated with the excavation, backfill and capping were compared to site specific criteria developed based on a combination of the federal and provincial guidelines.

Sydenham-Pearl Brownfield; Brantford, Ontario

Client: City of Brantford

Title: Environmental Coordinator/Project Engineer

Start/End Dates: 2012 to 2018

Scope/Description: Responsible for the completion of Phase One Site assessments, drafting Phase One and Two ESA reports, and filing RSCs in accordance with the amended O. Reg. 153/04 on two former industrial properties approximately 6.2 ha in size. Tasks involved database management, and coordination of presentations and meetings with the client, and for public information sessions. Assisted and provided technical input on remedial option strategies for the industrial sites such that RSCs could be obtained on properties prior to redevelopment for multiple land uses. Involved in the review and consolidation of chemical and geological data from numerous historical investigations completed by others to determine data gaps and plan subsequent investigations. The main contaminants on the properties include PHCs, VOCs, and heavy metals in soil, and PHCs and chlorinated VOC in groundwater.

Bus Rapid Transit Expansion Project, York Region, Ontario

Client: York Region Rapid Transit Commission

Title: Environmental Specialist

Start/End Dates: 2018

Scope/Description: Provided technical advisory and construction oversight services for environmental activities associated with the bus rapid transit expansion project for the Highway 7 and the Yonge Street segments. Provided peer review and cost verification of costs of site assessments, sampling plans, remedial action plans, and remediation reports.

Various City Water and Sewer Projects, Toronto, Ontario

Client: Metrolinx

Title: Environmental Specialist

Start/End Dates: 2017 to 2018

Scope/Description: Provided environmental advisory and technical review for various environmental sampling programs, investigations and reports.

Environmental Advisory Services, Historical Chemicals Plant; Brampton, Ontario

Client: Reichhold Inc. Facility

Title: Environmental Scientist

Start/End Dates: 2010 to 2014

Scope/Description: Provided environmental advisory services as required for the management of environmental conditions associated with a former chemicals plant. Services provided included the preparation and implementation of an annual groundwater quality monitoring program, including installation of additional investigation locations, remediation activities, and the consolidation of over 50 documents into a comprehensive summary document for submission to the Ministry, which included past soil and groundwater investigations, remediation activities, soil gas sampling activities in support of an RA program, and monitoring of an ongoing phytoremediation program.

West Don Lands (WDL); Toronto, Ontario

Client: Infrastructure Ontario (IO)

Title: ESA Coordinator and Team Member

Start/End Dates: 2010 to 2013

Scope/Description: The largest brownfield site currently under development in Ontario, this former industrial site encompasses mixed-use residential and commercial development, as well as a substantial parkland component, after it served as the Pan American Athletes' Village (PAAV) for the 2015 Pan/Parapan American Games (Pan Am Games). The PAAV housed over 8,000 athletes and

coaching staff. This revitalization project involved an aggressive schedule to secure the environmental approvals required in advance of infrastructure and building construction by development partners. Site characterization, RA, remedial option feasibility studies (ROFSs), remediation, and risk mitigation measures (RMMs) are key project components. Jacobs conducted field investigations and prepared multiple Phase One and Phase Two ESA, ROFS, and RA reports in parallel in order to meet the development schedule. The reports complied with O. Reg. 153/04 under the *Environmental Protection Act*, as amended by O. Reg. 511/09, such that RSCs could be obtained on properties prior to development. Currently, Jacobs is acting as the third-party Ministry Qualified Person (QP) to audit compliance with the Certificates of Property Use (CPUs) and RAs during the implementation of the RMMs.

In October 2011, the WDL project was selected by the Canadian Urban Institute for the ***2011 Brownie Award*** as the project that best demonstrated ***Excellence in Project Development at the Neighbourhood Scale***. The annual Brownie Awards program recognizes leadership, innovation, and environmental sustainability in brownfield redevelopment across Canada.

Responsible for coordinating and providing technical support for the preparation of 5 Phase One ESA reports, 8 Phase Two ESA reports (including 8 additional investigation and remediation reports), 2 preliminary Phase Two ESA summary memos, and 13 RSCs for the 63-Block on the WDL. The accelerated schedule and multiple stakeholder input characterizing Phase Two ESA reports have required us to implement best practices and templates that facilitate schedule and quality compliance. The ESA team evaluated data at approximately 195 areas of potential environmental concern (APECs) and 1,933 sample locations across the site. Data generated were being used to build the conceptual site model (CSM) for each Phase Two grouping of blocks, to feed information into eight RA reports, and to develop the CSMs supporting filing RSCs for the properties.

Limited Phase I and II ESA; Ingersoll, Ontario

Client: Loblaws Properties Limited

Title: Site Assessor

Start/End Dates: 2013

Scope/Description: Completed a limited Phase I and II ESA for due diligence, which included the review and consolidation of past investigations completed by others, and a borehole and groundwater monitoring well installation program.

Wallace Avenue Site; Toronto, Ontario

Client: Akzo Nobel

Title: Environmental Scientist

Start/End Dates: 2012 to 2013

Scope/Description: Professional environmental services to support a response to an Ministry audit on an RSC completed by another consultant. Work included a review of existing soil and groundwater data, additional field investigations, and corrections to the RSC submission.

Hydrogeological Investigation Program; Thunder Bay, Ontario

Client: Confidential Client

Title: Environmental Scientist

Start/End Dates: 2009 to 2013

Scope/Description: Preparation of a Hydrogeological Investigation Program Report on the characterization of a closed landfill and the surrounding physical setting to characterize waste, and geological and hydrogeological setting of the landfill, as well as assess the potential for migration of

contaminants. Additional environmental services included the preparation of an Environmental Compliance Approval (ECA) Application for the post-closure maintenance, the supporting documentation and financial assurance, and a monitoring report.

Various projects, Toronto, Ontario

Client: General Motors of Canada Limited

Title: ESA Coordinator

Start/End Dates: 2012

Scope/Description: Responsible for the completion of Phase I and II ESAs in accordance with CSA Group (CSA) standards for the potential sale of the property.

Confidential Project; Strathroy, Ontario

Client: Meridian Technologies

Title: Environmental Scientist

Start/End Dates: 2010 to 2011

Scope/Description: Preparation of a technical memorandum on the extent of contamination of chlorinated VOCs in groundwater on the project site with relation to the known contamination on an adjacent property.

Phase I and II ESAs, Erb Street; Waterloo, Ontario

Client: City of Waterloo

Title: Environmental Scientist

Start/End Dates: 2009 to 2010

Scope/Description: Completion of Phase I and II ESAs, including the coordination of site activities and the completion of Phase I and II reports.

Groundwater Sampling Program; Oshawa, Ontario

Client: General Motors Canada

Title: Environmental Scientist

Start/End Dates: 2009 to 2010

Scope/Description: Coordination of field work, and preparation of a groundwater sampling report.

Multiple Project Sites

Client: TransCanada Pipelines

Title: Environmental Scientist

Start/End Dates: 2009 to 2010

Scope/Description: Coordination of field work, and preparation of investigation and sampling reports for various TransCanada Pipeline sites in Bracebridge, Kapuskasing and Maple, Ontario.

Cambridge Landfill; Cambridge, Ontario

Client: Region of Waterloo

Title: Environmental Scientist

Start/End Dates: 2009 and 2010

Scope/Description: Provided support for the completion of an annual monitoring report.

Site Closure of Highway Service Centres; Southern Ontario

Client: IO

Title: Environmental Scientist

Start/End Dates: 2009 to 2009

Scope/Description: Completion of RSC requirement reports, baseline conditions reports, water supply and sewage system reviews, and site visits during remedial works for 23 service centre sites across Ontario, to support the property redevelopment and transfer of leases of the highway service centres.

Nanticoke Generation Station; Nanticoke, Ontario

Client: Ontario Power Generation

Title: Environmental Scientist

Start/End Dates: 2009

Scope/Description: Preparation of various documentation to support the decommissioning of fuel-oil tanks.

Pottersburg Creek Polychlorinated Biphenyls (PCB) Vault Remediation; London, Ontario

Client: Ministry

Title: Environmental Scientist

Start/End Dates: 2009

Scope/Description: Provided support for the completion of a Phase I ESA and ongoing remediation and excavation activities to support the decommissioning of PCB vaults, including removal and transportation of soil for destruction.

Humberstone and Bridge Street Landfill; Ontario

Client: Niagara Region

Title: Environmental Scientist

Start/End Dates: 2009

Scope/Description: Preparation of alternatives for landfill expansion, including volume estimates and cost evaluations.

Stisted Landfill; Huntsville, Ontario

Client: Regional District of Muskoka

Title: Environmental Scientist

Start/End Dates: 2009

Scope/Description: Various support work for the proposed evapotranspiration cover and closure report for the landfill.

Experience Prior to Jacobs

Groundwater Well Installation and Monitoring Program; Brampton, Ontario

Client: Confidential Client

Title: Project Manager

Start/End Dates: 2008

Scope/Description: Coordination and supervision of the installation and repairs of monitoring wells; monitoring, sampling, and analysis of results; and reporting.

Surficial Soil Sampling Program; Brampton, Ontario

Client: Confidential Client

Title: Project Manager

Start/End Dates: 2008

Scope/Description: Coordination and completion of a semiannual surficial soil sampling program, analysis of results, and reporting.

Environmental Management Systems (EMS); Toronto, Ontario

Client: Confidential Client;

Title: Environmental Scientist

Start/End Dates: 2008

Scope/Description: Coordination and involvement in various EMS projects, including asbestos survey, waste audit, and sanitary and stormwater sampling.

Surface Water Sampling Program; Niagara Falls, Ontario

Client: Confidential Client

Title: Environmental Scientist

Start/End Dates: 2008

Scope/Description: Coordination and completion of surface water sampling requirements for Municipal Industrial Strategy for Abatement (MISA) program, analysis of results, and reporting.

Soil Remediation; Niagara Falls, Ontario

Client: Confidential Client

Title: Environmental Scientist

Start/End Dates: 2008

Scope/Description: Conducted oversight for a remedial excavation program of impacted soils; completed analysis of results and reporting.

Closed Landfill; Toronto, Ontario

Client: City of Toronto

Title: Environmental Scientist

Start/End Dates: 2008

Scope/Description: Provided drilling oversight for the installation of an LFG management system.

Various projects, Toronto, Ontario

Client: Confidential Clients

Title: Environmental Scientist

Start/End Dates: 2006 to 2008

Scope/Description: Coordinated and conducted installation of monitoring wells, coordinated and provided oversight for well maintenance and repairs, and conducted single-well response tests, conducted groundwater sampling, analyzed results, and completed reporting.

Various Industrial Sites

Client: Various Clients

Title: Environmental Scientist

Start/End Dates: 2006 to 2008

Scope/Description: Coordinated and conducted groundwater monitoring and sampling programs at numerous sites.

Three PHC-impacted Sites; Toronto, Ontario

Client: Confidential Client

Title: Environmental Scientist

Start/End Dates: 2006 to 2008

Scope/Description: Coordinated and conducted monthly maintenance, monitoring, and sampling of water treatment systems; conducted quarterly groundwater sampling; analyzed results; and completed reporting.

Bedford PCB Remediation; Indiana, U.S.

Client: Confidential Client

Title: Environmental Scientist

Start/End Dates: 2003 to 2006

Scope/Description: Provided project support for the completion of corrective actions, and remedial investigations and feasibility studies (RI/FSs). Provided coordination and oversight of quality assurance (QA) and quality control (QC) activities. Facilitated e-Monitor software implementation. Conducted air, soil, sediment, and surface water sampling.

Former Assembly Plant; Massachusetts, U.S.

Client: Confidential Client

Title: Environmental Scientist

Start/End Dates: 2003 to 2006

Scope/Description: Provided project support for the completion of a RI/FS and remedial implementation programs, including the completion of detailed cost analysis, and present worth and annual costs. Completed various management and coordination tasks, including invoicing, scheduling, budgeting, and change orders.

Former Lagoon Site; New York, U.S.

Client: Confidential Client

Title: Environmental Scientist

Start/End Dates: 2003 to 2005

Scope/Description: Provided project support for a natural attenuation former lagoon site on monitoring reports and natural attenuation study. Reviewed human health and ecological RAs. Completed various management and coordination tasks, including invoicing, scheduling, budgeting, and change orders.

Jacobs

Victoria joined Jacobs as a Junior Environmental Scientist in 2017, working in the Federal and Environmental Solutions Group from Jacobs' Kitchener office. Victoria has experience preparing technical reports, including Phase One and Two Environmental Site Assessments (ESAs), sediment characterization technical memorandums, and soil management plans. She also has experience working on remedial excavations and environmental monitoring projects, including soil and groundwater sampling, surface water and sediment sampling, and test pit installation and confirmatory sampling. Victoria has experience with the Ontario *Clean Water Act* and source water protection and has conducted drinking water threat inventories for a regional municipality.

Relevant Project Experience

Technical Writer; Soil Management Plan; Confidential Client; Great Lakes, Ontario; 2017 to present. Responsible for the preparation of a Soil Management Plan in consultation with the Ministry of the Environment, Conservation, and Parks, and Environment and Climate Change Canada, for the remediation of PAH and PCB impacted sediments in Lake Ontario.

Field Technician/Junior Environmental Site Assessor; Phase Two Environmental Site Assessment; City of Guelph; Ontario 2018 to present. Supported completion of Phase Two Environmental Site Assessments (ESA) reporting in accordance with O. Reg 153/04 for two sites in preparation for future development, including a NAPL impacted site. Tasks included providing technical support for the preparation of a Phase Two ESA report, including technical writing and data analysis, as well as field tasks including drilling and monitoring well installation, groundwater sampling using passive sampling methods, and hydrogeological investigation and analysis of hydraulic conductivity tests.

Construction Oversight; Remedial Excavations; ATCO Electric; Grande Prairie, Alberta. Supervised the remedial excavations of pesticide impacted soils in two residential areas in Grande Prairie. Responsible for confirmatory sampling of remedial excavations and backfilling sources, and confirming quantities for payment certificates.

Field Coordinator; Quarterly Groundwater Sampling; Amherstburg Land Holdings; Ontario; 2017 to present. Coordinated annual and quarterly groundwater monitoring program evaluating surface water and groundwater. Collected groundwater samples and a water level snapshot of a series of shallow and deep monitoring wells, as well as groundwater seeps and surface water samples from nearby creeks. Coordinated and authored technical memorandums and annual reports on the results of the quarterly and annual sampling. Monitored flow in nearby creek and collected samples during high flow events.

Junior Environmental Site Assessor; Phase Two Environmental Site Assessment; Waterfront Toronto – Portlands; Toronto, Ontario; 2018 to present. Worked as part of a team to prepare the Phase Two ESA for various Records of Site Condition (RSCs) for the Toronto Portlands. Responsible for evaluating soil and groundwater data, confirming delineation of the contaminants of concern, preparation of sampling and analysis plans, and report writing.

Field Technician; Bi-Annual Groundwater Sampling; Nouryon; Cornwall, Ontario; 2018 to present. Supported Bi-annual groundwater and landfill gas monitoring program. Collected water levels for groundwater modeling and groundwater samples from a VOC impacted site using passive sampling methods.

Field Technician; Confirmatory Sampling of Potential Fill Sources; Amherstburg Land Holdings; Windsor, Ontario; 2018 to present. Confirmatory sampling and review of analysis to determine acceptability of potential fill sources. Desktop review of potential fill locations to determine analytical requirements. Supervision of test pit installation and responsible for the collection of soil samples. Review of analytical results and the determination of acceptability of the material based on the project's Fill Management Plan.

Construction Inspector; Arsenic Impacted Soils Remediation Project; Windsor Detroit Bridge Authority; Ontario; 2018. Performed construction oversight for the remediation of arsenic impacted soils associated with the construction of the new Gordie Howe International Bridge. Monitored site activities including the remedial excavation, backfilling, monitoring well decommission, and stockpile construction. Assisted with contract administration duties including confirming quantities for payment certificates, and drafting and distributing meeting minutes. Responsible for confirmatory sampling of remedial excavations, backfilling sources and capping materials. Liaise with contractor regarding work to be completed and contractual expectations.

Field Technician; Environmental Drilling in Thermal Remediation; Confidential Client; Sarnia, Ontario; 2018. Drilling in thermal remediation to determine efficacy of the treatment system and characterization of VOC impacted soils. Field supervised a drilling crew during borehole investigations and impact delineation. Collected environmental soil samples for confirmatory analysis of VOCs to determine the efficacy of the treatment system, and the delineation of areas that required ongoing treatment.

Field Support/Junior Environmental Site Assessor; Phase One and Two ESA for a Confidential Project; Infrastructure Ontario; Toronto, Ontario; 2017. Supported completion of Phase One Site assessments of three land parcels, drafting Phase One ESA reports in general accordance with O. Reg. 153/04. Tasks involved providing technical support for the preparation of the 3 Phase One ESA reports, and field support for environmental and geotechnical investigations for one Phase Two ESA report.

Field Support/Technical Writer; Stormwater Management Facility Sediment Analysis; Guelph, Ontario, 2017 to 2019. Collected sediment samples from stormwater management ponds to determine the suitability of the sediment for alternative uses and divert the sediment from going to the landfill. Activities included working safely around water, communicating professionally with members of the public, following proper sampling and material handling procedures, and follow up data management. Analysis included chromatogram comparisons of PAH and PHC sources to samples collected.

Jacobs

M.A.Sc., Chemical Engineering, University of Toronto

B.Eng., Environmental Engineering, National University of Singapore

REGISTRATIONS/ CERTIFICATIONS

Professional Engineer: Alberta and Ontario

QP_{ESA} (O. Reg. 153/04)

QP_{RA} (O. Reg. 153/04)

Travis Tan

ENVIRONMENTAL PROJECT MANAGER

Travis has over 11 years of experience in the environmental field, specializing in providing solutions for brownfield redevelopment, including risk assessment, risk management, and remediation.

Travis is a Qualified Person for Environmental Site Assessment (QP_{ESA}) as defined by Ontario Regulation (O. Reg.) 153/04. He has managed and provided senior technical oversight on environmental site assessment (ESA) work for more than 100 sites across Ontario and Alberta. These sites include a 69-hectare (ha) (170-acre) former power plant, an operating aircraft manufacturing facility, a 101-ha (250-acre) former chemical manufacturing plant, a 36-ha (90-acre) former wood treatment plant, and retail gasoline stations.

Travis has extensive experience in providing solutions for brownfield redevelopment and management of environmental liability. He has been involved in planning and managing risk assessments, including risk management plans (RMPs), and environmental remediation for complex brownfield sites. As a Qualified Person for Risk Assessment (QP_{RA}) as defined by O. Reg. 153/04, Travis has worked on approximately 30 risk assessments (RAs) on sites across Ontario, of which 15 have been accepted by the Ontario Ministry of the Environment, Conservation and Parks (MECP), and Records of Site Condition (RSCs) were subsequently filed.

Travis has provided due diligence consultation on numerous property transactions, including one valued at more than $200 million. He has also provided technical support for some of the top environmental attorneys in Ontario, and served as expert witness on environmental litigation.

Travis holds a Bachelor of Engineering degree in Environmental Engineering from the National University of Singapore and a Master of Applied Science degree in Chemical Engineering from the University of Toronto. He is a registered Professional Engineer in Ontario and Alberta.

Areas of Expertise

- Project Management
- Phase One and Two ESAs and RSCs
- Risk Assessment and Risk Management
- Remedial Action and RMP
- Litigation Support
- Peer Review

Relevant Project Experience

Former Coal-Fired Power Plant — Mississauga, Ontario

Client: Confidential Client

Title: Project Manager and Technical Lead

Start/End Dates: 2017 – 2019

Scope/Description: The approximately 69-ha site is located along the shore of Lake Ontario in Mississauga, Ontario. The site was formerly a coal-fired power plant and is now undergoing redevelopment for mixed commercial, institutional, and residential use. The contaminations onsite included extensive petroleum hydrocarbons (PHCs) in soil and groundwater with light nonaqueous phase liquid (LNAPL), as well as polycyclic aromatic hydrocarbons (PAHs), heavy metals, and high levels of polychlorinated biphenyls (PCBs) in soil.

Responsibilities: Provided due diligence consultation during a property transaction valued at more than $200 million, and served as the project manager on the multimillion-dollar project. Led the strategizing of the RSC approach, including the RMP, formulating one that would best fit the redevelopment plan and provide opportunities to expedite the development of at least portions of the property and cost-effectively fulfill RSC requirements. Served as the technical lead on all environmental work, including Phase One and Two ESAs, RAs, and remediation to support the filing of multiple RSCs for the proposed redevelopment and for municipal land conveyances. Liaised with the City of Mississauga and the MECP to enhance project delivery.

Former Domtar Wood Preserving Plant — Edmonton, Alberta

Client: Cherokee Canada Inc.

Title: Project Manager and Technical Lead

Start/End Dates: 2012 – 2019

Scope/Description: The subject property is a former wood preserving plant in Edmonton covering more than 36 ha. The project objective was to obtain site closure from Alberta Environment and Parks (AEP) for future residential development.

Responsibilities: Served as the project manager on the multimillion-dollar project; served as the technical lead on all environmental work, including site characterization; remediation of more than 150,000 tonnes of soil contaminated with creosote, pentachlorophenol, dioxins and furans (D/F), and heavy metals; RA; construction of a safety berm as a means of exposure control; and application of remediation and reclamation certificates. Liaised with the City of Edmonton and AEP to enhance project delivery, and served as an expert witness at a hearing conducted by the Environmental Appeals Board of Alberta.

Risk Assessment of Oncoming Chlorinated Solvent Plume —Toronto, Ontario

Client: Confidential Client

Title: Project Manager and Technical Lead

Start/End Dates: 2012 – 2019

Scope/Description: The subject property is impacted with high levels of chlorinated solvent resulting from groundwater migrating from an adjacent site, where a former electrical component manufacturer operated.

Responsibilities: Served as the project manager and technical lead on all environmental work, including Phase One and Two ESAs, RA, preparation of an RMP, and evaluation of indoor air quality to support the

filing of an RSC. Provided technical support for ongoing litigation, including peer reviewing environmental documents, preparing remediation cost estimates, and providing expert statements.

High-rise Condominium Development — Toronto, Ontario

Client: Confidential Client

Title: Project Manager and Technical Lead

Start/End Dates: 2017 – 2019

Scope/Description: The brownfield site was undergoing redevelopment for residential use with a high-rise condominium tower. The site was contaminated with PHCs from former leaky underground storage tanks (LUSTs), and widespread LNAPL was observed. Filing of an RSC was required to support redevelopment.

Responsibilities: Served as the project manager and technical lead on all environmental work, including Phase One and Two ESAs. Prepared a complex conceptual site model (CSM), estimated cost and soil volume for remediation, supervised remediation, and performed confirmatory groundwater sampling. Liaised with the City of Toronto to facilitate a land conveyance.

Former Electroplating Operation — Toronto, Ontario

Client: Confidential Client

Title: Senior Reviewer

Start/End Dates: 2018 – 2019

Scope/Description: The site was formerly used for electroplating operations. The contaminants of concern (COCs) in the bedrock groundwater include volatile organic compounds (VOCs), PHCs, and heavy metals. A permeable reactive barrier (PRB) was installed to mitigate offsite migration of the groundwater contamination.

Responsibilities: Served as the QP_{ESA} and $QP_{RA,}$ and provided senior review of all environmental work, including Phase One and Two ESAs and RA, including development of an RMP.

Former Metal Works — Cambridge, Ontario

Client: Confidential Client

Title: Senior Reviewer

Start/End Dates: 2015 – 2019

Scope/Description: The site is located within the Middleton Wellfield and is impacted with chlorinated solvents in soil and groundwater from historical metal works, and heavy metals and PAH from previous infilling activities. The groundwater impact was found in fractured bedrock and comingled with a regional plume, creating a highly complex CSM. The filing of an RSC was required to support redevelopment for mixed residential/commercial use.

Responsibilities: Served as the QP_{ESA} and QP_{RA}, and provided senior review on all environmental work, including Phase One and Two ESAs, RA, and the preparation of a complex RMP to protect onsite receptors from vapour inhalation and direct exposure risks, as well as the Middleton Wellfield from potential migration of the groundwater impact in the fractured bedrock during and after site construction activities. Liaised with the MECP and Regional Municipality of Waterloo on issues pertaining to the RA and RMP, and the protection of the Middleton Wellfield.

Multiple Sites across Ontario

Client: Confidential Client

Title: Account Manager, Project Manager, and Technical Lead

Start/End Dates: 2015 – 2019

Scope/Description: Projects for a private developer of residential and commercial properties across Ontario and Alberta.

Responsibilities: Served as the account manager, project manager, and technical lead on all environmental work. Provided due diligence consultations on more than 10 sites, one involving multiple land transactions for a 1.6-ha development in downtown Toronto. Also managed Phase One and Two ESAs and remediation work for the client, including a remediation of a 20-ha site in Toronto formerly used as a warehouse. The site was impacted with PHCs that leaked from several former underground storage tanks (USTs). The work included the removal of the USTs and about 50,000 tonnes of impacted soil.

Former Tannery — Toronto, Ontario

Client: Confidential Client

Title: Senior Reviewer

Start/End Dates: 2015 – 2018

Scope/Description: The site was a former tannery located in a residential area in Aurora, Ontario contaminated with VOCs, PHCs, PAHs, and inorganic parameters, including heavy metals, sulphide, and salt.

Responsibilities: Served as the QP_{ESA} and QP_{RA}, and provided senior review on all environmental work, including Phase One and Two ESAs, remediation, RA, and the preparation of an RMP. The RMP included mitigation of vapour and direct exposure risks, and had to be worked into the overall plans for flood protection and rehabilitation of Tannery Creek. Several rounds of consultations with the stakeholders, including the MECP, Regional Municipality of York, and Lake Simcoe Region Conservation Authority were conducted.

Operating Furniture Manufacturing Site — Toronto, Ontario

Client: Confidential Client

Title: Project Manager and Technical Lead

Start/End Dates: 2017 – 2018

Scope/Description: The site had high levels of chlorinated solvents in soil and groundwater resulting from a leaking degreasing tank. The projective objective was to manage the environmental liability for financing.

Responsibilities: Served as the project manager and technical lead on all environmental work, including soil and groundwater assessment, RA, indoor air sampling, remedial excavation, and injection of potassium permanganate to break down the COC.

Land Conveyance — Toronto, Ontario

Client: Confidential Client

Title: Senior Reviewer

Start/End Dates: 2017 – 2018

Scope/Description: The site had PHCs, PAHs, and metals impact in soil related to historical infilling along Lake Ontario.

Responsibilities: Served as QP_{ESA}, $QP_{RA,}$ and senior reviewer for an RA conducted to support the filing of an RSC for land conveyance to the City of Toronto, and an RMP that included measures to protect

construction and utility workers, ensuring that the RMP was consistent with the City of Toronto land conveyance policy.

Former Lead Smelting Facility — Calgary, Alberta

Client: Confidential Client

Title: Project Manager and Technical Lead

Start/End Dates: 2012 – 2018

Scope/Description: The site was contaminated with lead in soil at levels as high as several hundred thousand parts per million (ppm), resulting from former lead smelting operations. The objective of the project was to obtain site closure from AEP.

Responsibilities: Served as the project manager and technical lead on all environmental work to obtain site closure, including site characterization, RA, and preparation of an exposure control plan and a health and safety plan (HASP). Liaised with AEP to enhance project delivery.

Former Auto Repair Garage — Whitby, Ontario

Client: Confidential Client

Title: Project Manager and Technical Lead

Start/End Dates: 2016 - 2018

Scope/Description: The site was heavily impacted with waste oil and hydraulic oil from a former LUST and in-ground hydraulic hoists. Extensive LNAPL was observed and delineated.

Responsibilities: Served as the project manager and technical lead on all environmental work, including Phase One and Two ESAs, preparing a remedial action plan (RAP), coordinating geotechnical assessment to confirm the stability of the adjacent building during remedial excavation, excavating heavily contaminated soil for offsite disposal, and injecting chemical oxidant.

Multiple Sites across Canada

Client: A multinational retail company

Title: Account Manager, Project Manager, and Technical Lead

Start/End Dates: 2016 - 2018

Scope/Description: Environmental work for a multinational retail company on sites across Ontario, and one in British Columbia.

Responsibilities: Provided due diligence consultations and Phase One and Two ESA work; and cross-sold other services to the client.

Aircraft Parts Manufacturing Plant — Ajax, Ontario

Client: Confidential Client

Title: Project Manager and Technical Lead

Start/End Dates: 2011 – 2018

Scope/Description: The subject property is an operating aircraft parts manufacturing plant. Groundwater was contaminated with chlorinated solvents from degreasing operations.

Responsibilities: Served as the project manager and technical lead for an RA conducted to support the health and safety program at the facility. The work included Phase One and Two ESAs, RAs, RMP preparation, and assessment of indoor air quality through indoor air and subslab vapour sampling.

Multiple Sites across Canada

Client: A global fast food chain

Title: Account Manager, Project Manager, and Technical Lead

Start/End Dates: 2015 - 2017

Scope/Description: Environmental work for a global fast food chain on sites across Ontario, and one in Saskatchewan.

Responsibilities: Served as the account manager, project manager, and technical lead on all environmental work, including due diligence consultations and Phase One and Two ESA work

Former Paper Manufacturing Facility — Peterborough, Ontario

Client: Confidential Client

Title: Project Manager

Start/End Dates: 2014 - 2016

Scope/Description: The site was previously used for paper manufacturing, and a major spill of toluene took place during its operation. Widespread LNAPL was delineated, and the groundwater plume was migrating offsite onto the downgradient residential properties.

Responsibilities: Served as the project manager on all environmental work, including delineation assessment and operation of a pump-and-treat system.

Multiple Phase I Environmental Site Assessments in Texas

Client: Confidential Client

Title: Project Manager

Start/End Dates: 2016

Scope/Description: Due diligence Phase I ESAs were completed in support of the purchase of about eight properties in Texas used for storing equipment for oil and gas drilling.

Responsibilities: Served as the project manage on all environmental work r.

Former Appliance Manufacturing Plant — Mississauga, Ontario

Client: Trinity Development Group Inc.

Title: Project Manager and Technical Lead

Start/End Dates: 2012 - 2015

Scope/Description: The site, situated on shallow bedrock, was impacted with chlorinated solvents in soil and groundwater from previous appliance manufacturing operations.

Responsibilities: Served as the project manager and technical lead on all environmental work. The filing of multiple RSCs was required to support redevelopment for mixed commercial, residential, and parkland use, and land conveyance to the City of Mississauga for the construction of the Beechwood sewage pumping station. The work involved Phase One and Two ESAs, remediation, RA, and RMP preparation and implementation. The scope of the RMP included vapour mitigating measures, protection of construction and utility workers, hydraulic barrier in utility conduits, and monitoring of groundwater and indoor air. The RA and RSC filing were completed under a challenging timeline and site conditions. Liaised with the City of Mississauga during RMP preparation; had an advisory role to the construction manager during RMP implementation; and liaised with the MECP during an audit of the RMP implementation.

Former Chemical Processing Plant — Edmonton, Alberta

Client: A multinational company

Title: Environmental Engineer

Start/End Dates: 2009 - 2014

Scope/Description: The subject property is a former industrial manufacturing plant in Edmonton covering more than 101 ha. Soil and groundwater were impacted with a wide range of VOCs, including acetone, benzene, and chlorinated solvents and degradation products; as well as aldehydes and alcohols, organic acids, pesticides, and heavy metals. The work included drilling investigations, annual groundwater monitoring, preparation of a CSM and RA, and modelling of fate and transport of COCs in groundwater.

Responsibilities: Scoped and managed all field investigations work and groundwater monitoring work across the 101-ha site, and assumed a leading role in the preparation of a CSM and modelling of contaminant fate and transport.

Former Food Processing Plant — Toronto, Ontario

Client: Trinity Development Group Inc.

Title: Project Manager

Start/End Dates: 2011 - 2014

Scope/Description: Contaminated soil containing PHCs, heavy metals, and PAHs from historical infilling activities was found across the site. The site was undergoing redevelopment for commercial retail use.

Responsibilities: Served as the project manager on all environmental work, including Phase One and Two ESAs and RA, including preparation of an RMP, to support an RSC filing.

Former Electrical Component Manufacturing Plant — Toronto, Ontario

Client: Confidential Client

Title: Project Manager

Start/End Dates: 2009 - 2013

Scope/Description: The site was contaminated with high levels of chlorinated solvents and degradation products from historical electrical component manufacturing operations. The filing of an RSC was required for the planned redevelopment for residential use.

Responsibilities: Served as the project manager on all environmental work, including Phase One and Two ESAs, RA, and preparation of an RMP.

Former Waste Recycling Facility — Toronto, Ontario

Client: Confidential Client

Title: Project Manager

Start/End Dates: 2011 - 2013

Scope/Description: The site was impacted with PHCs from a former waste oil LUST.

Responsibilities: Served as the project manager on all environmental work, including conducting field investigation, preparing a RAP, and executing remediation via in situ chemical oxidation (ISCO).

Parking Garage — Markham, Ontario

Client: Confidential Client

Title: Project Manager

Start/End Dates: 2008 - 2012

Scope/Description: The site had contaminated soil, reportedly brought in during subway construction. The COCs included PHCs, heavy metals, and PAHs.

Responsibilities: Conducted field investigations, and served as the project manager on all environmental work, including Phase One and Two ESAs and RA, including preparation of an RMP to support an RSC filing.

High-rise Condominium Development — Toronto, Ontario

Client: Confidential Client

Title: Project Manager

Start/End Dates: 2009 - 2012

Scope/Description: The downtown Toronto site was contaminated with chlorinated solvents in groundwater, extending into bedrock.

Responsibilities: Served as the project manager on all environmental work, including Phase One and Two ESAs, RA, and preparation of an RMP to support an RSC filing.

Former Retail Gasoline Station — Cannington, Ontario

Client: Confidential Client

Title: Environmental Engineer

Start/End Dates: 2008 - 2011

Scope/Description: The site was heavily impacted with fuel oil from a LUST and was improperly handled by a previous consultant.

Responsibilities: Conducted field investigation and conducted remediation via ISCO; and prepared reports for litigation support.

Former Film Manufacturing Facility — Toronto, Ontario

Client: Confidential Client

Title: Environmental Engineer

Start/End Dates: 2007 - 2010

Scope/Description: The 19-ha site was previously used for film and camera-related manufacturing. The COCs included chlorinated solvents, heavy metals, and cyanide. The environmental work included Phase One and Two ESAs, and RA to support an RSC filing.

Responsibilities: Prepared CSM and RA.

Operating Self-storage Facility — Toronto, Ontario

Client: Confidential Client

Title: Environmental Engineer-in-Training

Start/End Dates: 2007 - 2009

Scope/Description: The self-storage site had impacts of PAH and heavy metals from historical importation of impacted fill material. The environmental work included Phase One and Two ESAs and RA, including preparation of an RMP.

Responsibilities: Conducted field sampling, prepared Phase One and Two ESAs, developed a CSM, prepared RMP, and carried out RMP monitoring.

Due Diligence Assessment — Multiple sites across Canada

Client: Confidential Client

Title: Environmental Engineer-in-Training

Start/End Dates: 2008

Scope/Description: Due diligence assessment was conducted for the sale of several aluminum processing plants in British Columbia, Alberta, Ontario, and Quebec.

Responsibilities: Review of environmental documents, site inspections, and report preparation. Work was completed under challenging timelines.

Multiple Phase One Environmental Site Assessments in Ontario

Client: Confidential Client

Title: Environmental Engineer-in-Training

Start/End Dates: 2007

Scope/Description: Due diligence Phase One ESAs were completed in support of the purchase of about 20 properties in Ontario used by asphalt manufacturing operation.

Responsibilities: Review of environmental documents, site inspections, and report preparation for the 20 sites.

Edgar (Ed) H. Taves

PROJECT LEAD

Ed Taves has over 31 years of professional experience in environmental consulting. He specializes in environmental liability/due diligence assessments (Phase One and Two ESAs), site investigation/characterization, risk assessment, remedial option analysis, contaminant hydrogeology, facility decommissioning and Brownfield redevelopment, preparation of Record of Site Conditions (RSCs), regulatory compliance, waste material characterization and hazardous waste management, remedial planning, data analysis and interpretation, and procurement and contract oversight. Clients have included a variety of federal and provincial departments and ministries, municipal governments, industries, as well as members of the legal, financial, accounting, and land development communities. Projects have been completed for a wide variety of contaminants including petroleum hydrocarbons (PHCs) occurring as LNAPL and dissolved phase; a variety of volatile organic carbons (VOCs) including chlorinated aliphatics (dissolved and as DNAPL), polynuclear aromatic hydrocarbons (PAHs); a variety of metals; polychlorinated biphenyls (PCBs); pesticides; nutrients such as phosphorus and ammonia; energetic, unexploded ordnance; chemical warfare agents, and radiologicals. He has acted in a number of roles including project manager, task manager, senior technical consultant, and public and regulatory agency liaison.

Distinguishing Qualifications

- Over 31 years of professional experience in environmental consulting
- Specializes in environmental liability/due diligence assessments (Phase One and Two Environmental Site Assessments [ESAs]), site investigation/characterization, risk assessment, remedial option analysis, contaminant hydrogeology, facility decommissioning and Brownfield redevelopment, preparation of Record of Site Conditions (RSCs), regulatory compliance, waste material characterization and hazardous waste management, remedial planning, data analysis and interpretation, and procurement and contract oversight.

Relevant Project Experience

Greenwich Mohawk Brownfield Site; City of Brantford, Ontario

Client: Corporation of the City of Brantford

Title: Project Manager/Senior Environmental Scientist

Start/End Dates: 2014 to Present

Scope/Description: Providing environmental advisory services for the ESAs, risk assessments and remediation on three former

EDUCATION/QUALIFICATIONS

M.Sc. (Biochemistry), University of Western Ontario

industrial properties covering approximately 21 hectares of land with the intent of redeveloping to parkland/community/residential use. Services provided include a data gap assessment, Phase I and II ESAs, remedial strategies, risk assessment, remedial design, pilot testing, construction oversight for the remediation and design reports, with the eventual purpose of filing record of site conditions (RSCs) for the properties. The contaminants include PHCs, VOCs and heavy metals in soil and PAHs, PHCs and chlorinated VOCs in groundwater. Over 140,000 of oil/LNAPL was recovered and recycled and 105,000 m^3 of LNAPL impacted soil was treated via soil washing and biopiling, and reused on site.

Sydenham-Pearl Brownfield Site; Brantford, Ontario

Client: Corporation of the City of Brantford

Title: Project Manager/Senior Environmental Scientist

Start/End Dates: 2012 to Present

Scope/Description: Providing environmental advisory services for the Phase I and II ESAs, risk assessments and remediation on two former industrial properties approximately 6.2 hectares in size with the intent of redeveloping to parkland/community/residential use. Services provided include a data gap assessment, Phase I and II ESAs, remedial options evaluations, developing a remedial strategy plan, cost estimates, contract administration and public consultation, with the eventual purpose of filing record of site conditions (RSCs) for the properties. The main contaminants on the properties include PHCs, VOCs, and heavy metals in soil, and PHCs and chlorinated VOC in groundwater. In 2016 this project was awarded a **Brownie Award by the Canadian Brownfields Network, for Sustainable Remediation and Technological Innovation**.

West Don Lands; Toronto, Ontario

Client: Ontario Infrastructure and Lands Corporation (IO)

Title: Senior Environmental Scientist

Start/End Dates: 2010 to 2016

Scope/Description: The largest brownfield site then under development in Ontario, this former industrial site was to include mixed-use residential and commercial development, as well as a substantial parkland component, after it served as the Pan American Athletes' Village (PAAV) for the 2015 Pan/Parapan American Games (Pan Am Games). The PAAV housed over 8,000 athletes and coaching staff. This revitalization project involved an aggressive schedule to secure the environmental approvals required in advance of infrastructure and building construction by development partners. Site characterization, risk assessment (RA), remedial option feasibility studies (ROFSs), remediation, and risk mitigation measures (RMMs) were key project components. CH2M conducted field investigations and prepared multiple Phase One and Phase Two environmental site assessments (ESAs), ROFS, and RA reports in parallel in order to meet the development schedule. The reports complied with Ontario Regulation (O. Reg.) 153/04 under the *Environmental Protection Act*, as amended by O. Reg. 511/09, such that Records of Site Condition (RSCs) were obtained on properties prior to development. CH2M is currently acting as the third-party Ontario Ministry of the Environment (MOE) Qualified Person (QP) to audit compliance with the Certificates of Property Use (CPUs) and RAs during the implementation of the RMMs.

In October 2011, the WDL project was selected by the Canadian Urban Institute for the ***2011 Brownie Award*** as the project that best demonstrated ***Excellence in Project Development at the Neighbourhood Scale***. The annual Brownie Awards program recognizes leadership, innovation, and environmental sustainability in brownfield redevelopment across Canada.

Providing senior review functions for the completion of Phase I and II ESA, and risk assessment programs. The subject site includes a large block of land with a wide variety of industrial occupancy over a 150-year period. A variety of assessment methods and remedial solutions are being implemented to facilitate the intended completion of numerous RSCs for varying end land uses.

Historical Pesticides Plant; Burlington, Ontario

Client: Reichhold Inc.

Title: Project Manager/Senior Environmental Scientist

Start/End Dates: 2010 to Present

Scope/Description: Providing environmental advisory and management services as required for the management of environmental conditions associated with a former pesticides plant currently leased for unrelated industrial operations. Services provided include liaison with regulatory parties for environmental permit approval and compliance monitoring, groundwater/wastewater sampling, data interpretation and reporting; as well as tendering and contract oversight for facility demolition.

Standing Offer for UXO, Environmental, and Cultural Resources Investigations; Former Camp Ipperwash; DCC

Client: Department of National Defence

Title: Senior Environmental Investigation Manager

Start/End Dates: 2010 to 2016

Scope/Description: Provided technical input to the environmental site assessments team under the Federal Approach to Contaminated Sites and the Department of National Defence's Contaminated Site Remediation Framework. Project work includes historical reviews, developing work plans for soil and groundwater sampling, and cost estimating. All site work is completed under UXO avoidance. $10M over 3 years.

Environmental Advisory Services, Historical Chemicals Plant; Brampton, Ontario

Client: Reichhold Inc.

Title: Project Manager/Senior Environmental Scientist

Start/End Dates: 2010 to Present

Scope/Description: Providing environmental advisory and management services as required for the management of environmental conditions associated with a former chemicals plant. Services provided include preparation and implementation of an annual groundwater quality monitoring program, liaison with neighbouring land owners, soil gas sampling activities in support of a risk assessment program; monitoring of an ongoing phytoremediation program.

Windsor-Essex Parkway; Public Private Partnership (P3) Project, Infrastructure Ontario (IO); Windsor, Ontario

Title: Senior Project Consultant

Start/End Dates: 2009 to 2010

Scope/Description: CH2M provided IO with contract development and administration services in association with the development of a P3 project for the Windsor-Essex Parkway of the Detroit River International Crossing. Providing environmental technical support as required.

Phase One/Two ESAs of an Automotive Facility; Windsor, Ontario

Client: General Motors of Canada Limited (GMCL)

Title: Project Manager/Lead Technical Scientist

Start/End Dates: 2009 to 2012

Scope/Description: Providing environmental advisory services for the ESA and closure of a large (over 1,000,000 square feet) automotive facility, with nearly 100 years of manufacturing history including

foundries, automotive parts manufacturing and assembly operations. Contaminants of concern include a wide variety of petroleum products, metals, VOCs, PAHs, PCBs, and asbestos. Evaluated remedial options analysis and currently implementing preferred remedial approach, in anticipation of property transaction.

Phase III ESA; Squirrel Island, Ontario

Client: Public Works and Government Services Canada (PWGSC)

Title: Project Manager and Senior Environmental Scientist

Start/End Dates: 2010 to 2011

Scope/Description: Retained by PWGSC on behalf of the Department of Fisheries and Oceans (DFO) to provide lateral and vertical delineation of metal related contamination in association with a marine navigation light. Remedial options were evaluated and the preferred remedial program recommended. The results of the Phase III ESA field program used to update the National Classification System for Contaminated Sites (NCSCS) score for the site.

Technology Review and Environmental Impact Assessment Proposed Biodiesel Manufacturing Facility; Welland, Ontario

Client: OPG

Title: Bioversel Sarnia, Inc

Start/End Dates: 2010

Scope/Description: Managed the completion of a Technology Review for biodiesel manufacturing equipment proposed for import and use in Canada. Managed the completion of an Environmental Impact Statement for the development of a proposed biodiesel manufacturing facility. Both tasks were completed to meet a very aggressive schedule to comply with the requirements of the ecoENERGY for Biofuels Program.

Preparation of an Application for a Certificate of Approval (CofA) (Air & Noise), Proposed Biodiesel Manufacturing Facility, Welland, Ontario

Client: Bioversel

Title: Project Manager

Start/End Dates: 2010

Scope/Description: Managed the preparation of an application for a CofA (Air & Noise) for a proposed biodiesel manufacturing facility.

Closure of a Flyash Pond; Sarnia, Ontario

Client: LANXESS Inc.

Title: Project Manager/Senior Environmental Scientist

Start/End Dates: 2010

Scope/Description: Prepared a Strategy Paper for the long term management of a closed flyash pond. Ongoing work elements include a surface water quality monitoring program.

Phase I and II ESA; Brampton, Ontario

Client: Textile Rubber & Chemical Co. Limited

Title: Project Manager/Technical Lead

Start/End Dates: 2009

Scope/Description: Phase I and II ESA activities were completed in support of the divestiture of industrial lands. A light nonaqueous phase liquid (LNAPL) was identified in an onsite groundwater monitoring well. The LNAPL was sampled and characterized. Contaminant source assessment activities were completed and applicable stratigraphic and hydrogeologic conditions identified. Remedial options were identified and evaluated, the preferred remedial solution implemented, and the contaminant remediated to meet applicable environmental standards.

Radiological Survey and Phase Two ESA, CFAD Angus

Client: CFB Borden; Defence Construction Canada (DCC)

Title: Senior Environmental Consultant

Start/End Dates: 2009 to 2010

Scope/Description: Managed the development and implementation of a Phase Two ESA to assess Areas of Potential Environmental Concern (APEC) and Areas of Potential Radiological Concern (APRC) associated with radiological wastes, unexploded ordnance (UXO), and chemical warfare agents (CWAs). The work plan included development of field work and sampling protocols, and a health and safety program to address subject risks including UXO avoidance, CWAs including mustard, lewisite and nerve agent, and Ra^{226}.

Standing Offer for Environmental Consulting Services; Suffield, Alberta; DCC

Client: DRDC Experimental Proving Grounds

Title: Senior Environmental Investigation and Assessor

Start/End Dates: 2009 to 2010

Scope/Description: Scope of services includes UXO demilitarization planning, contaminated sites investigation and assessment, remedial action planning, design and implementation of technology evaluations, and risk assessments for more than 50 APEC impacted by munitions, CWAs, and environmental contamination. Services commissioned to date include GIS, data management, technology reviews / feasibility studies, geophysical investigation review, and development of investigation work plans. Contract value: $1.5M over 2 years.

Radiological Survey and Environmental Site Investigation

Client: Confidential Client

Title: Assistant Project Manager

Start/End Dates: 2009 to 2010

Scope/Description: Managed the development and implementation of a program to assess environmental liabilities associated with radiological wastes, unexploded ordnance, and chemical warfare agents. The work plan included development of field work and sampling protocols, and a health and safety program to address subject risks.

Review of Geochemistry Baseline Condition – Proposed Petaquilla Copper Mine; Panama

Client: LGL Limited

Title: Project Manager

Start/End Dates: 2009

Scope/Description: Managed the peer review of Environmental Assessment (EA) documents pertaining to the assessment of the geochemistry baseline for the proposed Petaquilla copper mine.

International Experience

Capacity Transfer for Solid Waste Management; Riga, Latvia

Client: Canadian International Development Agency (CIDA)

Title: Project Manager

Start/End Dates: 1999 to 2002

Scope/Description: Retained by CIDA to supervise and monitor a World Bank funded municipal solid waste (MSW) management project in Riga, Latvia. An existing landfill was rehabilitated to include leachate control measures, energy cell technology, and landfill gas collection for electricity production.

Screening Level Environmental Assessment; Shenyang, China

Client: Innovative Board Technologies

Title: Project Manager and Senior Consultant

Start/End Dates: 1999 to 2001

Scope/Description: Retained to complete a Screening Level EA under the *Canadian Environmental Assessment Act* (CEEA), and the Regulation for Projects Outside Canada, for the development of a fibreboard and door manufacturing facility in Shenyang, China. These assessments included an engineering review of environmental aspects of the developments in accordance with applicable Chinese and Canadian regulations.

Preparation of Draft International Organization for Standardization (ISO) 14001 Program; Shenyang, China

Client: Innovative Board Technologies

Title: Project Manager and Senior Consultant

Start/End Dates: 2002 to 2003

Scope/Description: Prepared a draft ISO 14001 Environmental Management System (EMS) for the above-noted facility in Shenyang, China. Prepared the EMS in consultation with facility personnel located in both China and Canada. Prepared and led the EMS training sessions for plant personnel in China.

Baseline Study, Clean Development Mechanism (CDM) Project; Province of Tucuman, Argentina

Client: Export Development Canada (EDC)

Title: Senior Consultant

Start/End Dates: 2000

Scope/Description: Completed a Baseline Study for a CDM project in accordance with Section 12 of the Kyoto Protocol and associated guidance documents, for a landfill redevelopment project in the Province of Tucuman, Argentina. Completion of the Baseline Study required reviewing existing baselining methodologies, selecting the preferred baselining option, and reviewing applicable Argentinean regulations and socio-economic considerations.

Canadian Projects

Environmental Assessment of Shamrock Industrial Subdivision; London, Ontario

Client: City of London

Title: Project Manager and Senior Consultant

Start/End Dates: 2007 to 2009

Scope/Description: Project Manager for the investigation of latent environmental liabilities in association with a 5-hectare (ha) Brownfield property which was contaminated with various industrial and municipal wastes including pesticides, solvent and metals. The City of London was considering acquiring the site subsequent to a failed tax sale. Due diligence activities were completed, including detailed Phase I and II ESAs, remedial options analysis and cost estimating. Several presentations were made to municipal Council.

Environmental Remediation Program; Sarnia, Ontario

Client: Aamjiwnaang First Nation (AFN), Department of Indian and Northern Affairs (INAC) and Ontario Ministry of the Environment (MOE)

Title: Project Manager

Start/End Dates: 2006.

Scope/Description: Conducted an expedited program of screening level Phase I and II ESA activities in response to the discovery of drummed chemical wastes on AFN lands. The nature and extent of contamination was investigated, remedial options reviewed and engineering cost estimates prepared, and contractor quotations obtained for the completion of remedial activities. Managed the development and implementation of a remedial program and confirmatory testing to document project completion. Acted as liaison between AFN and project personnel, including Band Council, INAC, MOE and the public. First Nations subcontractors were used for the completion of project tasks. Project activities considered both provincial and federal (Canadian Council of Ministers of the Environment [CCME]) environmental standards. The work was completed to the satisfaction of all parties with no repeat investigation, remediation, confirmatory testing or reporting activities required.

Phase I and II ESA Activities; Port Hope, Ontario

Client: Cameco Corporation

Title: Senior Consultant

Start/End Dates: 2008 to 2009

Scope/Description: Technical lead for the completion of a Phase I ESA for the Port Hope Conversion Facility. Scope of work included interview of management and operations staff, and review of historical documentation to identify contaminants of concern (COCs) associated with existing and historical operations, contaminant releases and source areas, and potential migration pathways. Provided senior review functions for the intrusive investigation program.

Environmental Investigation in Support of a Property; London, Ontario

Client: Transaction; Natrel Inc.

Title: Project Manager

Start/End Dates: 2005 to 2007

Scope/Description: Managed the completion of due diligence activities in support of the divestiture of a parcel of Brownfield land known to be contaminated with free phase coal gasification wastes. Managed negotiations between the vendor and the City of London. Environmental risks were successfully characterized and the property title was successfully transferred.

Contaminated Sediment Assessment for the Kingston Dry Dock; Kingston, Ontario

Client: Public Works and Government Services Canada (PWGSC)

Title: Hydrogeologist

Start/End Dates: 2012

Scope/Description: Hydrogeological evaluation of surface water and groundwater interaction in support of an RA. An RA and supplemental investigation was completed for sediment contamination in waterlots and soil and groundwater conditions in uplands associated with the proposed divestiture of federal lands to a local municipality. The RA was completed to federal and provincial standards leading to filing of an RSC.

Development of a Risk Ranking System (RRS); Ontario

Client: Hydro One

Title: Project Manager and Senior Consultant

Start/End Dates: 1998 to 2002

Scope/Description: Retained by a large electrical transmission utility company with over 1600 properties to develop an environmental RRS. The RRS provided a technically defensible and socially acceptable assessment rationale to facilitate the ranking of their properties based on environmental considerations. The ranking results were used to prioritize specific properties for environmental remediation, investigation, or mitigation measures.

Phase II ESA and Risk Assessment Program

Client: Confidential Client

Title: Hydrogeologist

Start/End Dates: 1997 to 2002

Scope/Description: Retained by a large manufacturing facility to complete a focused site-specific risk assessment to assess the potential for adverse effects resulting from chlorinated solvent impacted groundwater egressing their property.

Facility Decommissioning; Old Dutch; Guelph

Client: Old Dutch

Title: Project Manager

Start/End Dates: 1994 to 1995

Scope/Description: Retained to oversee the cleaning, dismantling, and relocation of a bleach (sodium hypochlorite) manufacturing facility. Project works included characterization of residual process wastes, cleaning of all process tanks, reaction vessels and piping, characterization and offsite disposal of all residual process wastes and cleaning fluids, and transportation of all salvaged process tanks, reaction vessels, piping and appurtenances to a new facility for reconstruction.

Phase II/III Environmental Site Assessment; Red Lake, Ontario

Client: Ontario Ministry of the Environment

Title: Project Manager

Start/End Dates: 1993 to 1994

Scope/Description: Designed and constructed equipment to sample, in-situ (underwater), abandoned sealed drums in a northern Ontario lake without any loss of drum contents. Drums were resealed after sampling. Over 200 drums were identified using a magnetometer and accurately located by total station. In consultation with MOE personnel, a representative subset of the drums was selected and sampled in-situ. Subsequently retained to supervise the removal of all intact drums and properly dispose of their contents.

Spill Response and Site Remediation; Port Stanley, Ontario

Client: Ontario Ministry of the Environment

Title: Project Manager and Senior Consultant

Start/End Dates: 1993 to 1995

Scope/Description: Retained to assist provincial and federal authorities with the decommissioning of an oil gasification/fertilizer manufacturing site under the Orphan Sites and National Contaminated Sites Remediation Program (NCSRP). Project works included sampling and characterizing all wastes, identifying disposal options, preparing contract specifications for the decontamination, demolition and offsite disposal of all above- and below-grade structures and related appurtenances, and contract administration. Managed the collection and disposal of large volumes of coal tar liquids, and the excavation and management of free-phase PAH contaminated soils, including development and implementation of work programs and health and safety plans.

Jacobs

EDUCATION/QUALIFICATIONS

B.Sc., Physical Sciences, University of Guelph, Ontario

Post-graduate certificate, Environmental Engineering Applications, Conestoga College, Ontario

Brandi Wilson

RISK ASSESSMENT

Brandi Wilson is an Environmental Scientist with 3.5 years of experience in the environmental consulting industry. Her areas of expertise include environmental assessments, including conducting human health risk assessments (HHRAs), ecological risk assessments (ERAs), and Phase One environmental site assessments (ESAs); chromatogram analysis; data entry and processing; writing technical memorandums. She has prepared numerous technical reports, including pre-submission forms (PSFs), screening level risk assessments (SLRAs), and comprehensive risk assessments (RAs). Her skills include developing exposure modelling, calculating risk estimates, reporting, and responding to client and regulator comments on RA reports. She is familiar with provincial and federal environmental legislation, such as Ontario Regulation (O. Reg.) 153/04 (as amended) and the Record of Site Condition (RSC) filing process. Brandi also has experience with stormwater management (SWM) pond sediment chemistry related disposal versus beneficial use evaluations.

Distinguishing Qualifications

- Experience working in environmental consulting, including report writing, data processing, sediments sampling, using groundwater purge methods, and performing air emissions work.
- Excellent communication skills demonstrated through the ability to collaborate with project team members.

Relevant Project Experience

Method 3 Risk Assessment for a Former Resin and Plastics Manufacturing Facility in Massachusetts

Client: Confidential Client

Title: Junior Risk Assessor

Start/End Dates: May 2019 – Present

Scope/Description: Worked as part of team of risk assessors to develop a Method 3 HHRA report to assess the feasibility of a permanent solution for the release tracking numbers. Supported the development of the draft RA report and response to client comments. Reporting was completed to the requirements of 310 *Code of Massachusetts* Regulation (CMR) 40.0000, known as the Massachusetts Contingency Plan. Supported the development of Upper Concentration Levels in anticipation of an anticipated regulation update.

Risk Assessment of Per- and Polyfluoroalkyl Substances in Support of Brownfield Development; Ontario

Client: Internal Report

Title: Junior Risk Assessor

Start/End Dates: December 2018 – January 2019

Scope/Description: The potential presence of per- and polyfluoroalkyl substances (PFASs) at brownfield sites has implications for their redevelopment as the means of evaluating the risks associated with these emerging contaminants, and processing the sites through applicable regulatory frameworks, is largely undefined. While research, data, and information are evolving quickly on PFAS toxicology, as well as the fate and transport of these parameters in the environment, regulatory screening values and risk assessment approaches are largely lagging.

This internal report examines the approach by which human health and ecological risk assessment can be completed for a brownfield site in Ontario at which aqueous film-forming foam (AFFF) was applied during a historic fire. Currently, the Brownfield Regulation in Ontario does not include guidance or regulatory standards specific to PFAS. This report focuses on the potable groundwater ingestion pathway for humans as well as offsite groundwater migration and potential risks to aquatic organisms in offsite surface water bodies. It outlines the screening levels and toxicity values that may be applied to support the assessment of risk, as well as the conceptual human health and ecological exposure models needed to complete risk evaluations. By stepping through the risk assessment process for the site, a viable framework for assessing and addressing PFAS at brownfield sites will be established.

Port Lands; Toronto, Ontario

Client: Waterfront Toronto

Title: Junior Risk Assessor

Start/End Dates: December 2016 to Present

Scope/Description: Worked as part of a team of risk assessors to develop an SLRA for the Toronto Port Lands. Specific tasks included development of site-specific risk-based criteria and target levels for soil and groundwater. Currently working as part of a team to develop a Community Based Risk Assessment (CBRA) in support of the Port Lands Flood Protection and Enabling Infrastructure Project.

153 Eastern Avenue, Block 8W, and 18/20 Trinity Street; West Don Lands; Toronto, Ontario

Client: Infrastructure Ontario

Title: Junior Risk Assessor

Start/End Dates: December 2016 to Present

Scope/Description: Worked as part of team of risk assessors to develop RA reports for three sites, including the assessment of both human and ecological health. Supported the development of the draft RA report and response to client and regulator comments for all three sites. Reporting was completed to the requirements of O. Reg. 154/04. Worked as part of team to address the revision of the three RAs to incorporate the remediated condition of these sites; the reports are currently with the Ontario Ministry of Environment, Conservation and Parks (Ministry) for review and comment.

Confidential Site

Client: Infrastructure Ontario

Title: Junior Risk Assessor

Start/End Dates: July 2017 to Present

Scope/Description: Worked as part of team of risk assessors to develop due diligence RA (DDRA) report for a contaminated site, including the assessment of both human and ecological health. Supported the development of the draft DDRA report and response to client and regulator comments for all three sites. Work was completed to support a remedial options feasibility study.

Greenwich Mohawk Brownfield

Client: City of Brantford

Title: Junior Risk Assessor

Start/End Dates: July 2017 to Present

Scope/Description: Worked as part of team of risk assessors to develop RA reports for three sites, including the assessment of both human and ecological health. Supported the development of the draft RA report and response to client and regulator comments for all three sites. Reporting was completed to the requirements of O. Reg. 154/04. To meet the City's funding agreement deadlines and develop remedial targets, the draft RAs were completed on a compressed schedule. Lead the revision of the three RAs to incorporate the remediated condition of these sites; the reports are currently with the Ontario Ministry of Environment, Conservation and Parks (Ministry) for review and comment.

Sediment Quality and Beneficial Reuse; Calgary, Alberta

Client: The City of Calgary

Title: Environmental Scientist

Start/End Dates: January 2016 to December 2017

Scope/Description: Worked as part of a team to develop a beneficial reuse of SWM pond sediment for 17 SWM ponds located in Calgary. Performed polyaromatic hydrocarbon (PAH) modelling, petroleum hydrocarbon (PHC) analysis, and chromatogram review to support the development of the draft sediment quality reports for all 17 SWM ponds.

Phase I ESA, 61L/61AL Transmission Line Removal; Wainwright, Alberta

Client: AltaLink Management Inc.

Title: Junior Project Team Member

Start/End Dates: August to September 2016

Scope/Description: Jacobs was retained by AltaLink to prepare a Phase I ESA for the removal, salvage, and reclamation of 498 pole structures from the 61L/61AL transmission line from the existing right-of-way (ROW) onto the road allowance. The pole structures comprise single and double wood poles installed between the 1940s and 2010. The purpose of the Phase I ESA is to evaluate the potential of residual pentachlorophenol (PCP) and creosote impacts in soil around power poles following the decommissioning of these structures. In addition, a number of the pole structures are located adjacent to or within wetlands.

Experience Prior to Jacobs

Wellington Source Water Protection; Kitchener, Ontario

Client: Conestoga College

Title: Project Team Member

Start/End Dates: January to August 2016

Scope/Description: Prepared an area-wide modified Phase One ESA to help Wellington Source Water Protection administer the *Clean Water Act* in Mount Forest, Ontario. Collaborated with a team to conduct a records review, site reconnaissance, and interviews and assess other archival sources to locate areas of potential concern that would affect Wellhead Protection Areas in Mount Forest.

University of Guelph; Guelph, Ontario

Title: Laboratory Assistant

Start/End Dates: September 2011 to April 2012

Scope/Description: Collected and analyzed data from static and time-resolved visual spectrostropy equipment to determine conformational changes in the chlorine transport pathway of a proteo-halo-rhodopsin protein. Trained in laboratory health and safety, including laser operation, Workplace Hazardous Materials Information System (WHMIS), and operation and calibration of equipment. Prepared gel suspensions of the sample protein in various media and buffer solutions to obtain defensible results for publication.

Jacobs

Jinlong Zang

HYDROGEOLOGY

Jinlong Zang is a hydrogeologist with over 21 years of quantitative and physical hydrogeology experience in environmental site assessments (ESAs), contaminated groundwater evaluation, groundwater resources management, and oil sands mine closure and reclamation. He specializes in quantitative hydrogeological evaluations, and the application of numerical and analytical groundwater simulation tools, which includes groundwater flow and contaminant transport modelling at local and regional scales. Jinlong has extensive experience in hydrogeological investigation for both clean water and contaminated sites, including hydrogeological baseline studies, environmental impact assessments (EIAs), ESAs, and remediation options design and evaluation. He is an experienced project manager, including project planning, costing, and technical reporting; liaising with clients, contractors, and regulatory agencies; and managing project delivery.

Distinguishing Qualifications

- Over 21 years of hydrogeology and water resources experience, with a specialization in quantitative hydrogeological evaluations
- Significant knowledge of environmental regulations, standards, and guidelines
- Extensive experience in developing three-dimensional (3D) groundwater flow and contaminant transport modelling

Relevant Project Experience

Groundwater Management Impact Assessment - Groundwater Flow and Contaminant Transport Simulation for Pickering Nuclear Generating Station (PNGS); Ontario

Client: Ontario Power Generation (OPG)

Title: Senior Hydrogeologist and Groundwater Modelling Lead

Start/End Dates: 2015 to 2017

Scope/Description: OPG retained CH2M to support the execution of the Groundwater Management Impact Assessment, which was a hydrogeological study in support of the development of the Safe Storage groundwater management strategy at Pickering Nuclear Generating Station (PNGS). The assessment was completed in several phases. The first phase comprised several deliverables that referred to as the Groundwater Management Impact Assessment (GMIA). The GMIA used a groundwater modelling approach to represent the current groundwater conditions and assess various Safe Storage configurations in support of the development of the groundwater management strategy.

- Introduction to FEFLOW (Calgary, AB, 2013)
- GoldSIM Workshop (Sacramento, CA, 2012)
- CH2M HILL Foundations of Project Management Training (Denver, CO, 2010)

Eight different hydrostratigraphic units including overburden and bedrock aquifers were characterized and incorporated into the study. In addition to the complex stratigraphic and hydrostratigraphic units, an extensive network of buried structures and utilities is present beneath the PNGS site.

Update current understanding of three dimensional (3D) groundwater flow characteristics, develop a groundwater flow model representing the current groundwater flow characteristics to establish baseline conditions, construct a contaminant fate and transport model, and complete forecast contaminant transport simulations. The existing conditions as presented by the model were considered as the baseline conditions for PNGS. Subsequent modelling scenarios were developed to present future conditions under Safe Storage at PNGS, which were then compared back to the baseline conditions to assist in understanding potential environmental impacts and the appropriate management approaches for significant or adverse changes from the baseline conditions. Subsequent model scenarios were used to represent various Safe Storage configurations and evaluate the effects resulting from the hypothetical changes on the groundwater flow conditions and contaminant plume transport, including evaluation of the potential discharge to surface water features such as intake channel and Lake Ontario, in support of the development of the groundwater management strategy.

East Brampton Water Mains Hydrogeological Investigation; Region of Peel; Ontario

Client: Region of Peel

Title: Senior Hydrogeologist

Start/End Dates: 2015 to 2018

Scope/Description: Senior hydrogeologist working on behalf of the Region responsible for hydrogeological technical review and data gap analysis, design of hydrogeological investigation program, request for tender preparation, review of hydrogeological assessment of the site including overburden and bedrock geology, hydrostratigraphic units, hydraulic testing (single well response test and pumping test), groundwater level and quality, construction groundwater control evaluation, and groundwater surface water interaction assessment.

Kearl Lake Oil Sands Life of Mine Closure Planning; Alberta

Client: Imperial Oil Canada Ltd.

Title: Senior Hydrogeologist and Groundwater Modelling Lead

Start/End Dates: 2012 to 2013, 2015 to 2018

Scope/Description: CH2M was responsible for the detailed hydrologic and hydrogeologic analyses, and wetland and vegetation planning associated with Kearl Lake Oil Sands Mine closure regulatory requirements, with hydrogeological assessment being one of the primary components. The hydrogeological assessment involved review of major hydrogeological and hydrological features likely to be affected by the project activities, and quantitative evaluation of groundwater flow conditions and fate and transport of potential contaminates using a three-dimensional groundwater flow and contaminant fate and transport model, for an area approximately 144,000 hectare (ha). The assessment included compiling water level and flow data from major surface water features such as rivers, lakes, stream/creeks, and wetlands; regional geological and hydrogeological data such as groundwater elevation data groundwater flow conditions and groundwater quality data from Oil Sands Groundwater Agreement database; climate data such as precipitation. The hydrogeological assessment was conducted to evaluate changes in groundwater flow patterns and the groundwater quality in overburden and basal aquifers resulting from mine operations and closure activities, quantitatively evaluate groundwater surface water interactions such as recharge and discharge area and rate, support closure surface water features design; and evaluate potential pathways of soluble materials; evaluate potential changes in groundwater quality by assessing fate and transport of contaminants of concern, such as monitoring the effect of seepage from the tailings-filled mine pits on groundwater quality, and impacts to the surface water features due to

seepage from the tailings. The study identified sensitive areas in the groundwater regime and at the surface water features, that are likely to be affected by the groundwater flow and groundwater quality due to mine operational and closure activates, and developed a groundwater management plan including potential mitigation measures.

Groundwater Management and Modelling, Amherstburg, Ontario

Client: Amherstburg Land Holdings

Title: Senior Hydrogeologist

Start/End Dates: 2011 to Present

Scope/Description: The program includes a site characterization and ESA of a former industrial facility; closure plan development and remedial options evaluations associated with a 176-acre, 9-million-cubic metre (Mm^3) above-grade settling impoundment containing caustic salts (chloride); and monitoring natural attenuation (MNA) of an arsenic and chloride plume in a bedrock aquifer. Tasks include hydrogeological investigation and characterization, groundwater sampling program, surface water groundwater interaction assessment, groundwater flow and contaminant transport model, and remedial options evaluations.

Developed a 3D groundwater flow and contaminant transport model for the Soda Ash Settling Basin (SASB) to predict the long-term, steady-state chloride extent and magnitude resulting from the SASB chloride loading to the underlying aquifer system. The model was used to support long-term management alternatives and the site closure plan. Specific objectives of the model included: (1) predict the long-term, steady-state chloride plume extent and magnitude in the shallow groundwater zone, (2) predict the interaction between the shallow groundwater and Big Creek under long-term average conditions, and (3) predict the steady-state chloride plume extent and magnitude in the underlying bedrock aquifer.

Greenwich-Mohawk Brownfield; Brantford, Ontario

Client: City of Brantford

Title: Senior Hydrogeologist

Start/End Dates: 2013 to 2016

Scope/Description: Jinlong was acting as Senior Hydrogeologist providing consulting services for hydrogeological characterization of three former industrial properties covering approximately 21 hectares with a complex legacy of contaminated soil and groundwater, in support of the ESAs, risk assessments and remediation. Jinlong was responsible for the sampling and analysis plan development, overseeing monitoring well installation and groundwater level and quality sampling, single well response tests on multiple wells, design and implementation of a 72-hour step and pumping test, continuous surface water elevation and flow monitoring in Mohawk Canal, and establishing the hydrogeological conceptual site model including reviewing regional and site geological and hydrogeological conditions, obtaining Water Well Records (WWR) from the Ministry of Environment and Climate Change (MOECC), determine groundwater flow direction and gradient, and evaluating interaction between groundwater and Mohawk Canal. Jinlong was also leading a Permit to Take Water (PTTW) application, gaining regulatory approval, and managing follow on groundwater and surface water monitoring, in support of the remedial activities at the site. Additionally, Jinlong acted as hydrogeological lead for the risk assessment which included evaluation of groundwater flow conditions, contaminants fate and transport, and interaction between surface water and groundwater.

Fuel Oil Spills, Delineation and Remediation at Bruce Power; Tiverton, Ontario

Client: Bruce Power LP

Title: Senior Hydrogeologist

Start/End Dates: 2012 to Present

Scope/Description: This project involves subsurface investigation/remediation of contaminated soil and groundwater, resulted from fuel oil spills. Technical lead for groundwater investigation and responsible for establishing conceptual site model, evaluating non-aqueous phase liquid (NAPL) mobility and contaminate fate and transport, hydrogeological site characterization, pumping test design, implementation, analysis and permit to take water application. Lead for developing a 3-D groundwater flow model covering Bruce B area to simulate the potential zone of influence created by the operation of a pump and treat system.

Groundwater Flow Simulation for the Groundwater Monitoring Network and Program at the OPG Western Waste Management Facility (WWMF); Ontario

Client: OPG

Title: Senior Hydrogeologist and Groundwater Modelling Lead

Start/End Dates: 2014 to 2016

Scope/Description: CH2M was retained to conduct an assessment of the groundwater monitoring well network at the WWMF. The scope of work for the project included a four-part assignment to assess the current monitoring well network, to characterize the hydrogeology and current monitoring and sampling program, to repair existing wells and/or construct new wells to enhance the monitoring well network and to provide reporting on a two-year monitoring program. The project included a Hydrogeological Assessment, a Contaminant Source Term Assessment and a Groundwater Modelling Assessment that were used in an iterative process to assess the groundwater monitoring well network for the WWMF. Jinlong worked as Senior Hydrogeologist and was responsible for the Groundwater Modelling Assessment, the task included revising an existing 3D groundwater flow model for the OPG WWMF to evaluate the adequacy of the groundwater monitoring network. The model was used to simulate the flow paths and relative travel times from potential sources to the monitoring wells, also to evaluate the potential effects on the groundwater from the proposed expansion of the WWMF. The project resulted in a comprehensive assessment of the existing and expanded monitoring well network and recommendations on sampling and monitoring programs to provide ongoing groundwater protection for the WWMF. Results of the project were also used to support an environmental assessment for facility expansion.

Pesticide Plume Delineation and Groundwater Monitoring Program; Ontario

Client: Confidential Client

Title: Project Manager and Senior Hydrogeologist

Start/End Dates: 2008 to 2016

Scope/Description: Managed a plume delineation program to identify the horizontal and vertical extents of the subsurface contamination caused by historical spills. Prepared a remedial action plan based on the fate and transport analysis. Managed a groundwater monitoring program to evaluate the natural attenuation of contaminants of concern.

Water Balance Study for a Landfill Site; Ontario

Client: Confidential Client

Title: Senior Hydrogeologist

Start/End Dates: 2014 to 2015

Scope/Description: The purpose of the project was to identify potential leachate generation sources and evaluate alternatives for potentially reducing leachate generation, pumping frequency, or both, with the goal of potentially reducing the overall operations and maintenance (O&M) costs for the landfill site.

Conducted hydrogeological evaluations in support of the selection and conceptual design of groundwater barriers, to evaluate the potential performance on two different cutoff barriers, and to estimate potential reduction of leachate by implementing selected construction solutions.

Phased Environmental Site Investigation; Bramalea, Ontario

Client: Reichhold Inc.

Title: Project Manager and Senior Hydrogeologist

Start/End Dates: 2008 to 2015

Scope/Description: Managed a phased environmental site investigation for a former industrial site. Tasks included soil, soil gas, and hydrogeological investigation to identify contamination caused by historical site activities; contamination remediation, risk assessment (RA), and preparation of an environmental management plan.

Sydenham-Pearl Brownfield; Brantford, Ontario

Client: City of Brantford

Title: Senior Hydrogeologist

Start/End Dates: 2013 to 2014

Scope/Description: Technical lead for ESA hydrogeological investigations and data analysis; interpretation of regional and site geology and hydrogeology; establishment of site hydrogeology CSM, and hydrogeological site characterization.

Muskeg River Oil Sands Processing Plant and Mine Integrated Closure, Conservation, and Reclamation (CC&R) Plan; Alberta

Client: Shell Canada Energy

Title: Senior Hydrogeologist and Groundwater Modelling Lead

Start/End Dates: 2012 to 2013

Scope/Description: Preparation of an integrated closure water management plan as part of the Muskeg River Mine (MRM) CC&R Plan includes quantitative assessment of interactions between groundwater and surface water, wetlands, and soils, as well as an evaluation of possible migration paths of soluble materials. The current level of knowledge about material properties within the mining area, the physical setting of the mine relative to adjacent mining properties, and the complexity of surface drainage criteria warrant construction of a numerical groundwater flow model. A groundwater model was used as a feasibility assessment tool in a multidisciplinary approach to designing closure and reclamation plans.

Saskatoon Manufacturing Facility; Saskatoon, Saskatchewan

Client: ERCO Worldwide

Title: Senior Hydrogeologist and Groundwater Modelling Lead

Start/End Dates: 2013 to 2014

Scope/Description: Developed a 3D groundwater flow and particle tracking model to simulate the groundwater flow paths through the aquifer system beneath the site. The model was used to determine the direction of the groundwater flow, and estimate the travel times for conservative chemicals in the saturated groundwater environment.

West Don Lands; Toronto, Ontario

Client: Ontario Infrastructure and Lands Corporation (IO)

Title: Lead Hydrogeologist

Start/End Dates: 2010 to 2011

Scope/Description: The largest brownfield site currently under development in Ontario, this former industrial site will encompass mixed-use residential and commercial development, as well as a substantial parkland component, after it served as the Pan American Athletes' Village (PAAV) for the 2015 Pan/Parapan American Games (Pan Am Games). The PAAV housed over 8,000 athletes and coaching staff. This revitalization project involved an aggressive schedule to secure the environmental approvals required in advance of infrastructure and building construction by development partners. Site characterization, RA, remedial option feasibility studies (ROFSs), remediation, and risk mitigation measures (RMMs) are key project components. CH2M HILL Canada Limited CH2M conducted field investigations and prepared multiple Phase One and Phase Two ESAs, ROFSs, and RA reports in parallel in order to meet the development schedule. The reports complied with Ontario Regulation (O. Reg.) 153/04 under the *Environmental Protection Act*, as amended by O. Reg. 511/09, such that Records of Site Condition (RSCs) were obtained on properties prior to development. Currently, CH2M is acting as the third-party MOECC Qualified Person (QP) to audit compliance with the Certificates of Property Use (CPUs) and RAs during the implementation of the RMMs.

In October 2011, the WDL project was selected by the Canadian Urban Institute for the ***2011 Brownie Award*** as the project that best demonstrated ***Excellence in Project Development at the Neighbourhood Scale***. The annual Brownie Awards program recognizes leadership, innovation, and environmental sustainability in brownfield redevelopment across Canada.

Responsible for leading and providing technical support for all hydrogeological related tasks. Tasks included identification of data gaps; preparation of sampling plan for site investigations; hydrogeological investigations and data analysis; interpretation regional and site geology and hydrogeology; establishment of site hydrogeology CSM; groundwater surface water interaction assessment; report preparation; and responses to the comments.

Groundwater Flow Simulation of Darlington Nuclear Generating Station (DNGS), Darlington Refurbishment Project; Darlington, Ontario

Client: OPG

Title: Groundwater Modeller

Start/End Dates: 2010 to 2011

Scope/Description: CH2M was part of the OPG consultant team conducting the Federal Environmental Assessment (EA) for the Darlington Nuclear Generation Station (DNGS) Refurbishment Project. CH2M was responsible for the Geological and Hydrogeological Environment component of the environment as defined for the EA. The purpose of the project was to describe the existing (i.e., "baseline") environmental conditions throughout the study areas relevant to the Project. In characterizing the existing environmental conditions, an initial conceptual model of the Geology and Hydrogeology Environment was developed based on the substantial information available for the DN site including the New Nuclear Darlington Project.

The baseline characterization program relied on the existing hydrogeological investigations of the Darlington Protected Area but was supplemented by additional sampling programs (i.e. precipitation, soil and groundwater), to develop a conceptual model for the site. The conceptual model was then used to develop a groundwater flow model to simulate groundwater flow conditions in the Protected Area. Jinlong was responsible to construct a local study area groundwater flow model to simulate the baseline

conditions and the changes in land use resulting from the Refurbishment Project, and to simulate the migration pathways of tritium from the injection water storage tank (IWST) spill.

Groundwater Flow Simulation in the Area of Water Sampling Hole (WSH) 231 and the Low Level Storage Buildings (LLSBs) at the WWMF; Ontario

Client: OPG

Title: Groundwater Modeller

Start/End Dates: 2009 to 2011

Scope/Description: CH2M was retained by OPG to conduct an investigation of tritium found in Water Sampling Hole (WSH) 231 located adjacent to the Low Level Storage Buildings (LLSBs) at RWOS2 at the OPG WWMF. An increasing trend of tritium concentration has been found in WSH-231 and the source of tritium was unknown. CH2M conducted a detailed hydrogeological investigation to determine and assess the potential source of tritium. Investigations included the sampling of storm sewers, foundation drains, subsurface drainage systems, roof runoff, electrical manholes, site soils and groundwater. To sample groundwater, a new groundwater monitoring system was constructed inside the protected area of the LLSBs. Jinlong worked as groundwater modeler to constructed a 3D groundwater flow model in the area of the LLSBs, and applied the model to track the migration pathway of a tritium plume from the source area to the potential discharge location.

Contaminated Sediment Assessment for the Kingston Dry Dock; Kingston, Ontario

Client: Public Works and Government Services Canada (PWGSC)

Title: Hydrogeologist

Start/End Dates: 2012

Scope/Description: Hydrogeological evaluation of surface water and groundwater interaction in support of an RA. An RA and supplemental investigation was completed for sediment contamination in waterlots and soil and groundwater conditions in uplands associated with the proposed divestiture of federal lands to a local municipality. The RA was completed to federal and provincial standards leading to filing of an RSC.

Updated Phase Two ESA for Four Sites at Port Stanley Harbour; Port Stanley, Ontario

Client: PWGSC

Title: Hydrogeologist

Start/End Dates: 2011 to 2012

Scope/Description: The project's objective was to bring the intrusive investigation reporting for the project up to date with the requirements of the revised O. Reg. 153/04 for RSC filing. Tasks included developing the sampling and analysis plan (SAP), coordinating the field team in relation to carrying out the SAP, and assisting with database development and Phase Two reporting (to the requirements of O. Reg. 153/04 [as amended]) for four separate parcels of land.

ESA for a Former Correctional Facility Owned by the Province of Ontario

Client: Province of Ontario

Title: Hydrogeologist

Start/End Dates: 2010-2011

Scope/Description: The project included full delineation of previously identified contamination at the site, and cost estimation for feasible and cost-effective remediation as part of a comprehensive ESA.

Groundwater Flow Simulation in the Vicinity of New Nuclear-Darlington; Darlington, Ontario

Client: OPG

Title: Technical Reviewer

Start/End Dates: 2008 to 2009

Scope/Description: CH2M was responsible for the Geological and Hydrogeological Environment Existing Environmental Conditions Technical Support Document (TSD) which was intended to describe the existing (i.e., "baseline") environmental conditions throughout the study areas for the New Nuclear – Darlington (NND) Project adjacent to the existing Darlington Nuclear Generating Station (DNGS). Jinlong was rresponsible for the review and assessment of the groundwater flow simulation for the NND project as part of geology and hydrogeology effects assessment.

Groundwater Modelling: Development of Recommended Remediation Options for the Deloro Mine Site Cleanup; Deloro, Ontario

Client: Ontario Ministry of the Environment and Climate Change (MOECC)

Title: Hydrogeologist and Groundwater Modeller

Start/End Dates: 2008 to 2009

Scope/Description: Part of a multidisciplinary team that developed the recommended remediation options for the rehabilitation of the Tailings Area (TA) and the Industrial/ Mine Area (IMA) portions of the site. Provided design basis parameters based on the groundwater flow simulations undertaken for the TA and IMA. A series of groundwater collection wells were proposed and simulated to collect seepage beneath two tailings dams, in conjunction with other remediation features in the TA. A groundwater interceptor trench (GIT) was proposed and simulated in the IMA to lower the water level to isolate the interaction between the groundwater and the waste, to reduce the hydraulic gradient across the site, and to divert and decrease the contaminated groundwater discharge to the river. Also evaluated potential contaminant pathways and receptors, and estimated contaminant travel time, travel distance, and travel velocity for a long-term safety assessment for a federal regulatory submission.

Groundwater Flow Model – Trench Design Simulation; Alexander, Alberta

Client: EnerMark Inc.

Title: Groundwater Modeller

Start/End Dates: 2009

Scope/Description: Developed a 3D groundwater flow model to assist in designing the groundwater re-injection options, including injection wells and trench. Evaluated the re-inject location and flow rates. Predicted the influences of the injection on the groundwater flow regime.

Expansion of Walton Landfill; Walton, Ontario

Client: The Municipality of Huron East

Title: Hydrogeologist and Modelling Lead

Start/End Dates: 2011 to 2012

Scope/Description: Evaluated the potential environmental impacts that resulted from the proposed expansion of the landfill.

Contaminating Lifespan Assessment; Welland Landfill; Welland, Ontario

Client: Graftech International Holdings Inc.

Title: Hydrogeologist and Modeller

Start/End Dates: 2009 to 2010

Scope/Description: Used POLLUTE model to evaluate potential environmental impacts and assess the lifespan of the landfill.

Contaminating Lifespan Assessment; Scott Road Landfill; Sarnia, Ontario

Client: LANXESS Inc.

Title: Hydrogeologist and Modeller

Start/End Dates: 2009

Scope/Description: Applied POLLUTE model to determine the contaminating lifespan and evaluate the long-term potential of the landfill to adversely impact on the surrounding environment.

Landfill Site Lifespan Assessment; Ontario

Client: Confidential Client

Title: Hydrogeologist and Modeller

Start/End Dates: 2009

Scope/Description: Used POLLUTE model to determine the contaminating lifespan and evaluate the long-term potential of the landfill to adversely impact the surrounding environment.

Styrene Contamination Characterization and Remediation; Sarnia, Ontario

Client: LANXESS Inc.

Title: Project Manager

Start/End Dates: 2008-2009

Scope/Description: Managed a soil investigation program through borehole drilling to identify the contaminant extent and magnitude. Managed a soil remediation program through excavation to remove the styrene contaminated soils.

Hydrogeological Assessment for a PTTW Application, Kitchener Wastewater Treatment Plant (WWTP) Ultraviolet (UV), Effluent Pumping Station (EPS), and Plant 2 Upgrades; Kitchener, Ontario

Client: Regional Municipality of Waterloo

Title: Hydrogeologist

Start/End Dates: 2010-2011

Scope/Description: Responsible for the hydrogeological evaluation for the PTTW application, including design and oversight of pumping test, data interpretation, dewatering calculation, report preparation, and PTTW application.

Experience Prior to Jacobs

Density-Dependent Groundwater Flow Simulation; Former OCC Tacoma Facility; Tacoma, Washington, United States (U.S.)

Client: United States Environmental Protection Agency

Title: Groundwater Modeller

Start/End Dates: 2006 to 2008

Scope/Description: Synthesized relevant existing site data into a single overall conceptual hydrogeologic model and quantitative model (SEAWAT). Evaluated the potential optimization of the current groundwater

extraction and injection system. Evaluated the effectiveness of sediment remedial alternatives. Evaluated the effectiveness of potential groundwater remedial alternatives, and guided the development of remedial system monitoring programs.

Groundwater Flow and Contaminant Transport for Broadway Village, Lower Town; Ann Arbor, Michigan, U.S.

Client: The City of Ann Arbor

Title: Groundwater Modeller

Start/End Dates: 2005, 2007 to 2008

Scope/Description: Evaluated the effects of construction of a proposed sheet piling on the groundwater flow regime. Assessed hydraulic conditions associated with the dewatering activities during construction. Evaluated the effects of construction of slurry wall and underground structures. Simulated contaminant fate and transport with different remedial scenarios.

Groundwater Flow and Tritium Transport Simulation; Exelon Generation; Braceville, Illinois, U.S.

Client: Exelon Generation Company, LLC

Title: Groundwater Modeller

Start/End Dates: 2006

Scope/Description: Simulated various remedial pumping scenarios. Simulated tritium transport model predictions from the current conditions for various remedial scenarios. Simulated how the tritium plume would evolve under different conditions.

Groundwater Flow Analysis of Flood Events at Garland Road Landfill Site; Miami County; Ohio, U.S.

Client: Ohio Environmental Protection Agency

Title: Groundwater Modeller

Start/End Dates: 2006

Scope/Description: Performed the groundwater flow simulation (SURFACT) of floodwater saturating the vadose zone soil and emplaced waste. Estimated the amount of floodwater saturating the vadose zone, evaluated the effects of installing a geosynthetic clay liner (GCL) cap and cover system, and assisted in the engineering analyses of the GCL cover system.

Groundwater Flow and Contaminant Transport Modelling, North Sanitary Landfill; Dayton, Ohio, U.S.

Client: Ohio Environmental Protection Agency

Title: Groundwater Modeller

Start/End Dates: 2005 to 2006

Scope/Description: Evaluated infiltration through current and proposed landfill areas; and assessed the stability of the plumes that have been delineated, groundwater extraction remedies (if required), and natural attenuation remedies.

Groundwater Flow and Contaminant Transport Modelling, Closed Landfill; Realm Inc.; Elyria, Ohio, U.S.

Client: Ohio Environmental Protection Agency

Title: Groundwater Modeller

Start/End Dates: 2005

Scope/Description: Estimated the amount of dilution that may occur within groundwater between the landfill and the primary downgradient site boundary. Simulated steady-state plume conditions under the solute transport processes of advection and dispersion.

Groundwater Flow Modelling for Remedial Design (Slurry Wall), Willow Run; Ypsilanti, Michigan, U.S.

Client: General Motors Powertrain (GMPT)

Title: Groundwater Modeller

Start/End Dates: 2005

Scope/Description: Assisted with the preliminary design of the slurry wall, and evaluated the effects of the construction of a slurry wall on the groundwater flow regime in the site vicinity, specifically on the water table elevation beneath the existing site building. Compared the pre- and post-wall conditions to assess the resultant net changes in the groundwater system.

Review and Update Groundwater Modelling for Former AC Rochester Facility; Sioux City, Iowa, U.S.

Client: General Motors Corporation

Title: Groundwater Modeller

Start/End Dates: 2004

Scope/Description: Modified the existing groundwater flow model to incorporate an additional layer. Calibrated the model to a transient response.

Appendix C
Mandatory Certifications

APPENDIX C

Mandatory Certifications

As specified in Ontario Regulation (O. Reg.) 153/04, Schedule C, s. 5, the following Mandatory Certifications are made by the Qualified Person – Risk Assessment (QPRA) conducting and supervising the Risk Assessment (RA) for 200 Beverley Street, Guelph. The RA was prepared by CH2M HILL Canada Limited, now a wholly owned subsidiary of Jacobs Engineering Group Inc. (herein referred to as "Jacobs") on behalf of The City of Guelph on ~~November 16, 2020~~May 18, 2021.

Mandatory Certifications Regarding the RA for 200 Beverley Street, Guelph:

1. I have conducted or supervised a risk assessment report in accordance with the regulation.

2. I am a qualified person, as defined in Section 168.1 of the Act, and have the qualifications required by Section 6 of the regulation.

3. I have in place an insurance policy that satisfies the requirements of Section 7 of the regulation.

4. The risk assessment team included members with expertise in all of the disciplines required to complete the risk assessment in accordance with the regulation.

5. The opinions expressed in the risk assessment are engineering or scientific opinions made in accordance with generally accepted principles and practices as recognized by members of the environmental engineering or science profession or discipline practicing at the same time and in the same or similar location.

6. To the best of my knowledge, the certifications and statements in this risk assessment are true as of ~~November 16, 2020~~May 18, 2021.

7. By making these certifications in this risk assessment report, I make no express or implied warranties or guarantees.

Mandatory Certifications in Relation to the RA Property:

1. As of ~~November 16, 2020~~May 18, 2021, it is my opinion that based on the Phase One environmental site assessment and the Phase Two environmental site assessment and other relevant property information, the approach taken in the conduct of the risk assessment:

    a) is appropriate to evaluate human health and ecological risks from the contaminants of concern at the concentrations proposed as the standards specified in the risk assessment and assuming no measures have been taken at the RA property which have the effect of reducing the risk from the contaminants, and

    b) is consistent with the approach set out in the pre-submission form with the exception of those deviations listed in Section 1 of the report under the heading "Deviations from Pre-Submission Form".

2. As of ~~November 16, 2020~~May 18, 2021, it is my opinion that, taking into consideration the assumptions specified in the risk assessment report, including the use of the property specified in report Section 3 of the risk assessment, and any risk management measures recommended in the report, as long as the RA property satisfies those assumptions and meets the standards specified in

the risk assessment report, the contaminants of concern are unlikely to pose a human health or ecological risk greater than the level of risk that was intended in the development of the applicable full-depth site condition standards for those contaminants.

3. As of ~~November 16, 2020~~May 18, 2021, it is my opinion that the implementation of the risk management plan described in Section 7 of the risk assessment report is necessary for a contaminant of concern addressed in the risk assessment report to prevent, eliminate, or ameliorate any adverse effect from that contaminant to the human or ecological receptors addressed in the report and located on the RA property and is sufficient to address the current and potential future transport and exposure pathways.

4. As of ~~November 16, 2020~~May 18, 2021, the risk assessment report completely and accurately reflects the risk assessment assumptions and conclusions and all pertinent information has been included in the report and the appendices to the report.

Signed:

Katherine Appleby, B.E.S., EP
Qualified Person – Risk Assessment under Ontario Regulation 153/04
Jacobs Engineering Group Inc.

Appendix D
Phase I and II Summaries

Appendix D1
Phase I ESA Summary

Appendix D1. CH2M HILL Phase One Environmental Site Assessment Summary

This appendix summarizes the results and conclusions of the CH2M HILL Canada Limited (CH2M) Draft Phase One Environmental Site Assessment (ESA) document entitled *Phase One Environmental Site Assessment, Former International Malleable Iron Company, 200 Beverley Street, Guelph, Ontario*, dated August 18, 2017 (CH2M 2017).

City of Guelph (City) retained CH2M to complete a Phase One ESA in 2017 for the property identified as the former International Malleable Iron Company (IMICO) foundry facility, located at 200 Beverley Street in Guelph, Ontario (Site). The Site is approximately 5.2 hectares in size and is located east of the City's downtown. It is understood that the Phase One ESA was requested in support of the potential redevelopment of the Site from an industrial use to residential/parkland/institutional land use purposes. This change in land use requires a Record of Site Condition (RSC). The Site and the Phase One Study Area (defined as lands located within 250 metres [m] of the Site) are shown on Figures 2-1 and 2-2 (Appendix D3). The Phase One Study Area was expanded beyond 250 m from the Site (as shown on Figure 2-1 in Appendix D3) to include the following land:

- To the north to include entire industrial and commercial properties located on Elizabeth Street and Victoria Road South
- To the east to include entire industrial and commercial properties located along Victoria Road South and York Road
- To the south to include entire properties that appear to be former industrial and commercial properties located along the eastern side of Morris Street and northern side of York Road

The purpose of the Phase One ESA was to assess the Site and the Phase One Study Area in accordance with the defined terms of Ontario Regulation (O. Reg.) 153/04, as amended, for potentially contaminating activities (PCAs) to identify areas of potential environmental concern (APECs). To accomplish these goals, CH2M used a combination of activities (such as records review, Site visits, and interviews) to identify areas on or near the Phase One Property that may warrant further investigation. The Phase One ESA included the following components:

- Records review
- Interviews
- Site reconnaissance
- Evaluation of the information gathered from the records review, interviews, and Site reconnaissance
- Preparation of a Phase One ESA report
- Submission of the Phase One ESA report to the owner of the Phase One Property

The Phase One ESA was completed to satisfy the requirements for Phase One ESAs as specified within O. Reg. 153/04 (MECP 2011a). The Phase One ESA findings were used to support the development of a subsequent Phase Two ESA investigation for the Site to assess the subsurface environmental conditions and assist in the development of a recommended remedial or risk management strategy that may be considered for ongoing use or to facilitate potential redevelopment of the Site.

1.1 Current and Past Uses

Based on information obtained from the records review and interviews, the Site was considered to be first developed in 1913 when it was acquired by IMICO for use as an iron-jobbing foundry. Historical onsite buildings/structures and areas were identified from fire insurance plans (FIPs) and site plans in previous reports, including the foundry, annealing room, chipping room, galvanizing buildings, warehousing, storage (coal, sand, bricks, polychlorinated biphenyl [PCB] materials), paint shop, and offices.

The foundry closed in 1989, and the Site was generally vacant from that time on, with the exception of some reported community-type occupancy during the time of the Assembly of the Church of the Universe ownership

(1993 to 1997). A number of fires occurred during this period, and in 1997, the City took over the Site. Demolition of the buildings and removal of various wastes from the Site (including some excavated soil and PCB materials and a large above-ground storage tank [AST]) occurred in 1998 through 1999. The Site is currently vacant with no onsite operations occurring. No buildings or structures are located onsite; however, the majority of the concrete floors, foundations, and footings of historical buildings were present at the time of the Site reconnaissance (June 21 and 29, 2017).

Figure 6-2 identifies the historical buildings onsite. Table 7.1-1 summarizes the current and historical land uses at the Phase One Property, based on the results of the records review; this table includes the inferred historical occupant or activity.

1.2 Environmental Reports

The City provided CH2M with the environmental reports that had been previously completed for the Phase One Property. The intent of the environmental report review was to identify key environmental concerns regarding actual and potential areas of environmental concern within the Site and its adjacent properties.

The report list has been provided as Table 4.1.5-1, with a brief summary of each investigation or study.

1.3 Potentially Contaminating Activities

Based on a review of historical environmental reports, aerial photographs, FIPs, chain of title searches, City directories, interviews, an EcoLog Environmental Risk Information Service database search, and Site reconnaissance, the Phase One ESA identified PCAs or historical land uses of potential environmental interest on the Site.

The following PCAs were identified on the Phase One Property and resulted in an APEC:

- 8 – Chemical Manufacturing, Processing and Bulk Storage
- 27 – Garages and Maintenance and Repair of Railcars, Marine Vehicles, and Aviation Vehicles
- 28 – Gasoline and Associated Products Storage in Fixed Tanks
- 30 – Importation of Fill Material of Unknown Quality
- 32 – Iron and Steel Manufacturing and Processing
- 33 – Metal Treatment, Coating, Plating, and Finishing
- 34 – Metal Fabrication
- 39 – Paints Manufacturing, Processing, and Bulk Storage
- 46 – Rail Yard, Tracks and Spurs
- 55 – Transformer Manufacturing, Processing, and Use

The following PCAs were identified off the Phase One Property but within the Phase One Study Area:

- 8 – Chemical Manufacturing, Processing, and Bulk Storage
- 10 – Commercial Autobody Shops
- 11 – Commercial Trucking and Container Terminals
- 12 – Concrete, Cement, and Lime Manufacturing
- 27 – Garages and Maintenance and Repair of Railcars, Marine Vehicles, and Aviation Vehicles
- 28 – Gasoline and Associated Products Storage in Fixed Tanks
- 33 – Metal Treatment, Coating, Plating, and Finishing
- 34 – Metal Fabrication
- 37 – Operation of Dry Cleaning Equipment (where chemicals are used)
- 39 – Paints Manufacturing, Processing, and Bulk Storage
- 43 – Plastics (including Fibreglass) Manufacturing and Processing
- 45 – Pulp, Paper, and Paperboard Manufacturing and Processing
- 47 – Rubber Manufacturing and Processing
- 49 – Salvage Yard, including automobile wrecking

- 54 – Textile Manufacturing and Processing
- 55 – Transformer Manufacturing, Processing and Use
- 57 – Vehicles and Associated Parts Manufacturing

Figures 4-1a and 4-1b (Appendix D3) show the locations of the on- and offsite PCAs and the resulting APECs on the Phase One Property.

1.4 Areas of Potential Concern

The identified PCAs results in 33 APECs that CH2M considered to have the potential for subsurface environmental impacts to the Site. Of these, 29 APECs on the Site are considered to be attributable to onsite PCAs, and 4 APECs are considered attributable to offsite PCAs within the Phase One Study Area. The APEC locations are presented in Figures 4-1a and 4-1b (Appendix D3) and summarized in Table 7.3-1. Contaminants of potential concern (COPCs) have been identified for each APEC in Table 7.3-1 based on the historical operations and type of PCA associated with each APEC.

The identified APECs are summarized as follows:

1) Foundry – A foundry was operated on the Site by IMICO from 1913 to 1989 when the plant closed and was abandoned. The foundry operated as an iron-jobbing facility for the production of various metallic forms, using malleable and ductile iron (DCS 2014a). Foundry sands were predominantly located in the concrete pits and sumps of the main foundry building. Foundry sands, sludge materials, and process waste were removed from the Site, and buildings were demolished in 1999 (Earth Tech 1999). The Proctor & Redfern (P&R) investigation also reported that moulding sands and dust collector waste was stored at the northwestern corner of the building and drained to the truck bay (P&R 1991).

2) Machine Shop – A machine shop was shown on the 1916 FIP, east of the original foundry. The northern one-third of the Machine Shop was identified for "Tumbling and Cleaning" operations, inferred to be in association with the adjacent "Annealing Room" to the north. FIPs prepared in 1929, 1945, and 1960 showed this area changed operations to "Shipping", and a "Pattern Shop."

3) Annealing – An "Annealing Room" with four furnaces is shown on the 1916 FIP. A brick chimney is located on the northern wall. The 1929 FIP shows nine furnaces, with the Annealing Room extended westwards with an additional chimney on the northern wall within the extended area; the southern portion of the Annealing Room is identified as the "Tumbling Dep't." The 1946 FIP shows a structural addition on the eastern side of the Annealing Room, with two additional furnaces. The 1960 FIP shows further eastward expansion and the addition of a third furnace. Tumbling Dep't operations appear consistent in location and footprint from 1929 through to 1960. The furnaces are inferred to be coal fired from 1916 through to 1960, based on the nearby coal storage areas shown on the 1946 and 1960 FIPs and the absence of ASTs or underground storage tanks (USTs) for fuel oil storage on the FIPs. The furnace fuel from after 1960 to the end of operations in 1989 is not known, but a period of fuel-oil-fired furnace operation is suspected; see APEC 7. No information was identified to suggest coal or fuel oil storage within the Annealing Room; however, no information regarding temporary furnace fuel storage, transmission, or waste disposal was identified. Dust control equipment is shown on Figure 4 of the 1991 P&R report, on the northern side of the Annealing Room.

4) Sand Storage – The 1916 FIP shows a "Sand Shed." The 1929 and 1946 FIPs again show the Sand Shed, plus a second smaller building to the west labelled "Sand." The 1960 FIP shows the original "Sand Shed" as "Bricks" and the second smaller building to the west labelled as "Sand & Bricks," and an additional area to the north is labelled "Sand." No information was identified as to whether only clean process, spent foundry sands, or both were stored in these buildings; therefore, the potential storage of spent foundry sand in these buildings is considered. The purpose and types of bricks stored were not identified. The potential for new and used refractory brick and associated process materials is considered possible.

5) Galvanizing Building – A small free-standing building for "Galvanizing" was present on the southeastern portion of the Site as shown on the 1916, 1929, and 1946 FIPs. The galvanizing building was not shown on the 1960 FIP, with the area occupied by a larger new structure identified as "Fittings Whse" (warehouse). No information was identified regarding process chemical use and storage or waste management practices associated with the galvanizing operations conducted.

6) Chipping/Grinding Room – A "Chipping Room" was shown on the FIPs prepared in 1929, 1946, and 1960, located west of the Annealing area. The 1916 FIP shows this as exterior yard area west of the "Annealing Rm," with a small outbuilding that appears to be connected to the Annealing Room with a linear underground feature. The 1991 P&R report identified this as a "Trimming and Grinding" area; this information is inferred to be based on the interview of historical IMICO employees. "Dust control equipment" is shown on Figure 4 of the 1991 P&R report, on the exterior western side of the building.

7) Oil Houses, Boiler House and ASTs – A building is shown on the 1929 FIP to the north of the foundry and east of the power house with a label "Oil," and an additional building with the same label is shown to the north of this original building on the 1946 FIP. The 1960 FIP shows the northern building remaining but is not labelled as an oil house. The 1916 FIP shows this as empty exterior yard area north of the foundry. The P&R investigation figures show a boiler house to the east of the power house and two 45,000-litre (L) (10,000 gallon) oil tanks to the east of the building with "no history of leaks or spills" (P&R 1991). One 45,000-L AST was reported removed in 1998 during demolition activities and had been used to store Bunker C fuel. The AST removed had been located east of the Core Room (Earth Tech 1999).

8) Gasoline UST – As indicated on the 1960 FIP, a gasoline UST is shown north of a small office building and west of scales at the corner of Kingsmill Avenue and Beverley Street. The area is empty exterior yard area on the 1916 FIP, and the 1929 and 1946 FIPs show the office (labelled as a "time office") but does not show the UST. The gasoline use is not known; however, it is inferred to be for fuelling gasoline-powered equipment/vehicles used at the plant. The 1991 P&R investigation reported that an IMICO employee indicated the UST was removed in the mid-1980s in response to a request from the City due to gasoline vapours in the sewers along Beverley and York Streets. No significant contamination was reported (P&R 1991).

9) Oil House – A building is shown on the 1929 and 1949 FIP to the south of the Foundry and west of the galvanizing building with a label "Oil." The building/structure is not on 1916 FIP where the area is shown as exterior yard area and is not present on the 1960 FIP where the area is occupied.

10) Machine Shop – A machine shop is shown on the 1929, 1946, and 1960 FIP, east of the original foundry building. The floor is indicated as concrete. Machine shop cuttings were stored on the ground north of the building, and two small ceiling-mounted oil tanks were present in the building as noted in the P&R investigation (1991). The area is shown on the 1916 FIP as exterior yard area, with a small, unidentified building in the central area of the future machine shop. The northern portion of the machine shop was removed during the 1999 excavation based on the excavation footprint (EarthTech 1999).

11) Plating/Galvanizing Building – A galvanizing building was present on the Site as shown on the 1946 and 1960 FIP. The previous FIPs (1916 and 1929) show this as exterior yard area. On subsequent site plans (P&R, 1991; Earth Tech 1999), the building was identified as a storage shed and reported as having been used for dip galvanizing before 1975, with rinse water discharged into "dry wells" north of the building (P&R 1991). Investigations by P&R and Gartner Lee Limited (Gartner Lee) indicated high concentrations of zinc, other metals, and oil and grease. Free product was observed in wells (OW01-I, OW20, OW21). The area was excavated to bedrock (ranging from 1.3 to 2.0 metres below ground surface [mbgs]), and approximately 9,400 tonnes of contaminated soil and 925 tonnes of contaminated concrete were removed. Soil samples were collected from the final limits of the excavation walls and indicated most locations as having zinc and total petroleum hydrocarbon concentrations above the Table A Guidelines. The excavation was backfilled with granular "B" materials. A single sample was collected from the backfill and met the guidelines applicable at the time of the report (Earth Tech 1999). A well nest (OW22S/D) was installed within the

excavation area (the report for this installation was not available, and therefore, the soil conditions are unknown if analyzed as part of the investigation). Test pits and boreholes installed in the area in 2013 by Decommissioning Consulting Services (DCS) indicated soils having high zinc and other metal concentrations. Groundwater conditions at OW22S reported free product that was highly weathered with a slight oil/diesel odour (as reported in the summary of the Gartner Lee 2000/2001 investigation in DCS 2007a). Borehole logs for OW22S/D indicate the presence of fuel/diesel-type odour in the fill, which extends to approximately 1.5 mbgs, and hydrocarbon odour extending into the underlying bedrock with black staining on fractures. Groundwater sampled from OW22S has not since reported free product but has had concentrations of petroleum hydrocarbons (PHCs) increasing since the annual monitoring at this location began in 2016, up to 850,000 micrograms per litre (µg/L) of F3. Zinc concentrations have widely fluctuated over the years and have exceeded in approximately 25 percent of the sampling events between 2005 and 2016.

12) Coal Storage – A coal shed is shown on the 1946 FIP, to the north of the foundry and west of the powerhouse. A larger coal storage area is shown on the 1960 FIP, and the building is extended south to connect with the foundry on subsequent site plans (P&R 1991; Gartner Lee 1999; Earth Tech 1999) without an indication of its use. The previous FIPs (1916 and 1929) show this area as exterior yard area.

13) Rail Line – A former rail line was shown onsite north of the buildings on the 1916, 1929, and 1946 FIPs, running east to west, for the full length of the foundry building. On the 1960 FIP, the western portion was shown to have been removed to accommodate the newly constructed shipping/stock room; the rail siding ended at the eastern side of the building. It is inferred that raw materials and finished products were shipped by rail.

14) Possible Automobile Storage, Maintenance and Repair – An addition south of the foundry building on the eastern side of the offices, is labelled "Auto" on the 1960 FIP. Previous FIPs (1916, 1929, 1946) show this as exterior yard area.

15) Sand Mixing/Storage – Sand mixing is shown in a building north of the foundry as shown on the 1960 FIP. Previous FIPs (1916, 1929, 1946) show this as exterior yard area, north of the foundry. Subsequent site plans (P&R 1991; Gartner Lee 1999; Earth Tech 1999) do not have an indication of the building's use.

16) Transformers – Transformers are first shown on the 1960 FIP, north of the powerhouse. Previous FIPs (1916, 1929, 1946) show this as exterior yard area north of the power house. Transformers of this era may have contained PCBs.

17) Capacitor Room – PCB-containing capacitors were present in the centre of the foundry, as first shown on the P&R investigation site plan, and later remediated as part of the Earth Tech demolition (P&R 1991; Earth Tech 1999). Activities included removal of a concrete floor, a utility trench located in the eastern section (concrete walls, granular base) that was heavily stained, a subfloor was present in the central section, and a sump located in on the eastern portion of the capacitor room that were indicated as PCB-impacted and excavated and disposed offsite. The area was excavated to bedrock (1.0 – 1.3 mbgs) to remove concentrations above 5 micrograms per gram (µg/g). Final samples (composite soil, soil, concrete, and bedrock) from the limits of excavation in the capacitor room reported PCB concentrations under 5 µg/g, with the exception of two bedrock samples within the eastern sump area that had concentrations around 10 µg/g. A well (OW25) was installed within the excavation area (the report for this installation was not available, and therefore, the soil conditions are unknown if analyzed as part of the investigation) and subsequent groundwater monitoring of the area have indicated concentrations of chlorinated volatile organic compounds (VOCs) and PHCs (mainly F3) greater than the applicable potable water criteria (Table 6 Standards) (DCS 2007b, 2014b; AECOM 2017a, 2017b)

18) Coal Storage – A building for coal storage is shown on the 1960 FIP, to the north of the annealing room, with additional coal piled to the west of the building. Previous FIPs (1916, 1929, 1946) show this as exterior yard area to the north of the annealing room. The coal is inferred to be used in the furnaces in the annealing room. Subsequent site plans show this as a storage area (P&R 1991; DCS 2007a).

19) Coal Storage – A small building for coal storage is shown on the 1960 FIP, east of the time keeper's office at the Beverley Street entrance. The building is not present on previous FIPs (1916, 1929, 1946) and is shown as exterior yard area.

20) Garage – A garage was shown on the 1946 and 1960 FIP along Stevenson, on the western side of the property. The building is not present on previous FIPs (1916, 1929) and is shown as exterior yard area. The site investigation by P&R (1991) identified visual impacts to the soils south of the garage. Some elevated PCB concentrations were found in soil during subsequent investigations.

21) Coal Storage – The 1960 FIP indicates coal storage south of the garage on the western side of the Site. The building is not present on previous FIPs (1916, 1929) and is shown as exterior yard area, and on the 1946 FIP, the building is not labelled as coal.

22) Transformer – A 1200-volt transformer is shown on the 1991 Site Plan (P&R 1991).

23) Paint Shop – First shown on the P&R Site plan, a paint shop was located at the northern end of the site, between the shipping building and the storage area (P&R 1991). Drums were stored against the northern wall for materials used in the paint shop. The FIPs show this area as exterior yard area in the early FIPs (1916, 1929, 1946) and empty space between existing buildings in the 1960 FIP.

24) PCB Storage Area – An area located at the northeastern corner of the finishing and annealing room with a concrete pad was identified in the Earth Tech investigation as a former PCB Storage area. Concentrations above 50 parts per million of PCBs were identified. Previous site maps showed this area as "storage" (P&R 1991) or part of the Annealing Room (1946 and 1960 FIPs). During the demolition activities, approximately 250 kilograms of PCB-containing ash residue from the top of the concrete pad and the concrete pad itself was removed and taken for offsite disposal (Earth Tech 1999). Confirmatory samples below the pad were 0.63 µg/g and less than 0.05 µg/g. The soil was later excavated to bedrock as part of the soil remediation in the northeastern corner of the property (see APEC-11).

25) Drum Storage – Interviews with former employees as part of the P&R investigation identified drum storage activities that occurred along the northern property boundary (P&R 1991). No additional information was provided on the nature of what was stored and whether there was associated contamination as a result of the materials.

26) Former Substation – A former substation is indicated on the P&R (1991) and Earth Tech (1999) site plans. A sample of transformer oil from the former substation analyzed in the Earth Tech report indicated nondetect concentrations of PCBs. Similarly, one location installed during the DCS Phase II ESA (2007b) indicated nondetect PCB concentration. Previous site plans (FIPs) show this area as exterior yard areas.

27) Former Electrical Shop – A small electrical shop was noted to be on the southwestern corner of the foundry (P&R 1991). This addition was not shown on the FIPs from previous years and was shown as the exterior yard area west of the foundry.

28) Waste Oil Storage – Used oil was stored above ground on the southwestern end of the foundry as shown on the P&R Site Plan (P&R 1991).

29) Fill of Unknown Quality – Areas of the Site have a layer of fill above the native silty sands. Previous investigations have indicated a layer of fill consisting of foundry sands, slag, and cinders (up to 1.0 m) was found across the site (P&R 1991) and the fill to be mix of foundry operation waste such as "coal, clinker, ash, metals and detritus from the former foundry operations" and reworked native from "reworking onsite soils as a result of initial construction and subsequent expansion activities" (DCS 2007b). The yard areas were additionally noted to have been oiled (presumably engine oil) (P&R 1991).

30) Potential Impacts from Adjacent Properties to the North – Historical and current operations on properties to the north have the potential to impact the Phase One Property, including rail lines, paper manufacturing, auto body repair shops, gasoline station, trucking company, concrete products manufacturing, plastic

products manufacturing, electroplating company, window/door manufacturing, paint application, and scrap yard.

31) Potential Impacts from Adjacent Properties to the East – Historical operations on the property to the east have the potential to impact the Phase One Property, including steel manufacturing, foundry operations, packing manufacturing, potential USTs, bulk fuel storage, scrap yard, chemical manufacturer/distribution, and transformer use.

32) Potential Impacts from Adjacent Properties to the South – Historical operations on properties to the south have the potential to impact the Phase One Property, including metal product manufacturing, potential USTs, and a transportation company.

33) Potential Impacts from Adjacent Properties to the West – Historical operations on properties to the west have the potential to impact the Phase One Property, including window manufacturing, metal treatment, metal product manufacturing, former refractory facility, and motor vehicle part manufacturing.

1.5 Soil and Groundwater Quality from Previous Investigations

The Phase One ESA identified areas on the Site where previous subsurface investigations had identified contaminants of concern in soil and groundwater at concentrations exceeding the Ontario Ministry of the Environment, Conservation and Parks' *Table 6 Generic Site Condition Standards for Shallow Soils in a Potable Groundwater Condition* for Residential/ Parkland/ Institutional/ Industrial/ Commercial/ Community property use and coarse textured soils, which are specified in the *Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act,* dated April 15, 2011 (Table 6 Standards) (MECP 2011b). Analytical results were summarized from previous investigations conducted by P&R (1991), Gartner Lee (1999), AECOM (2010 to 2016), Earth Tech (1999), DCS (2007 and 2014), and WSP (2016).

1.5.1 Soil Quality

Previous soil investigations were conducted on the Site by P&R (1991), Gartner Lee (1999), Earth Tech (1999), DCS (2007 and 2014) and WSP (2016) and indicated soil exceedances of the Table 6 Standards for metals and inorganics, VOCs, PHCs, polycyclic aromatic hydrocarbons (PAHs), and polychlorinated biphenyls (PCBs). The following points summarize the findings of these investigations:

- Inorganic and metals exceedances were widespread across the Site. The predominant chemical found was zinc, with concentrations over 10,000 µg/g found in the northeastern corner of the Site in the area of the former galvanizing/plating building. The area was excavated to bedrock in 1999 and backfilled with granular B material (Earth Tech 1999). Soil samples collected in the area after remediation indicate exceedances of zinc, cadmium, cyanide, and lead. Exceedances over the remainder of the Site other than zinc were mostly due to lead and cadmium.
- VOC concentrations that were detected above the Table 6 Standards were limited to benzene, toluene, ethylbenzene, xylene (BTEX), tetrachloroethylene (PCE), and trichloroethylene (TCE) at five locations. BTEX had marginal exceedances in the area of the former maintenance garage; benzene had a marginal exceedance south of the PCB capacitor room; and TCE and PCE were detected at low concentrations (under 1 µg/g) at three locations near the northeastern property line.
- Locations where PHCs were analyzed in accordance with current methodology were limited to five boreholes and 10 test pits sampled by DCS in 2007 and 2014. Concentrations detected above the Table 6 Standards were found for F3 in two locations: southeast of the former capacitor room and south of the northeastern excavation. Older hydrocarbon analyses showed elevated concentrations near the former maintenance garage in the area of the former fuel ASTs, the paint shop, the southwestern end of the foundry, and at the northeastern excavation area. Confirmatory wall samples of the excavation indicated remaining elevated TPH concentrations.

- PAHs were detected at concentrations above the Table 6 Standards at approximately 30 percent of the locations analyzed. Exceedances were found at various locations across the Site, including samples from the excavated soil at the northeastern portion of the Site. The highest concentrations were found southeast of the former capacitor room at concentrations up to 900 µg/g.
- PCB concentrations above the Table 6 Standards were found in the area of the former maintenance garage, at confirmatory samples from the PCB remediation in the former capacitor room, and southwest of the former machine shop. Concentrations were found up to 10 µg/g.

1.5.2 Groundwater Quality

Previous investigations were conducted by P&R (1991), Gartner Lee (1999 and 2004), AECOM (2010 to 2016), and WSP (2016), and indicated groundwater exceedances of the Table 6 Standards for metals and inorganics, VOCs, PHCs, PAHs, and PCBs. Full site characterization for the monitoring wells and parameter groups has not been conducted since 1998. Subsequent sampling has focused on the eastern portion of the Site for the primary COCs, with annually sampling conducted by AECOM since 2010. The following points summarize the findings of the investigations:

- Metal and inorganic exceedances detected on the Site were mainly due to zinc, which has exhibited exceedances over most of the Site. The highest concentrations of metals were generally found in the northeastern corner of the property by the former galvanizing building. Prior to the excavation, zinc was measured up to 42,000 µg/L; after remediation, concentrations of zinc were found up to 3,200 µg/L. Lead was found at four locations across the Site exceeding the Table 6 Standard with concentrations up to 32 µg/L. Thallium, arsenic, barium, and cadmium were found in localized areas along the southeastern and southwestern property boundary. Other metal exceedances were limited samples collected within the northeastern corner prior to excavation (antimony, beryllium, chromium, cobalt, copper, mercury, molybdenum, nickel, and vanadium).
- VOC exceedances detected on the Site were mainly chlorinated VOCs and BTEX parameters. The chlorinated VOCs were found mainly on the eastern portion of the Site, with high concentrations for TCE, cis- and trans-1,2-dichloroethylene (DCE), and vinyl chloride. Lower concentrations of TCE were found over most of the central and eastern portions of the Site. Other than historical detections prior to the northeastern excavation, trichloroethane (TCA) and derivatives were found on the southern portion of the Site with the highest concentrations downgradient of the former electrical shop at 140 µg/L. The highest concentrations of BTEX were measured in the northeastern portion of the property, from sampling events prior to the soil excavation in the area. BTEX concentrations on the remainder of the property were below the Table 6 Standards with the exception of one location in the vicinity of the former UST.
- Of the samples where PHCs were analyzed in accordance with current methodology, seven locations had exceedances of the Table 6 Standards. Most of these were located in the eastern portion of the Site, with the exception of one located in the vicinity of the former capacitor room. Free product has been observed at OW23S on multiple occasions. Older hydrocarbon analyses indicated elevated concentrations in the northeastern area that was excavated, near the former maintenance garage, in the vicinity of the former ASTs, and near the southern property corner
- PAHs were found exceeding the Table 6 Standards in eight locations onsite. The greatest concentrations were from pre-excavation samples collected in the northeastern area of the Site, up to 229,000 µg/L. Concentrations post-remediation were found up to 280 µg/L. Elevated concentrations were also found at OW23S where free product has been detected. Other areas across the Site reported detected concentrations below 3 µg/L.
- Of 16 locations where PCBs were analyzed, one location exceeded the Table 6 Standards, located southeast of the foundry. The PCB remediated area of the former capacitor room reported concentrations of 1.27 µg/L.

1.6 Phase One Conceptual Site Model

A conceptual site model (CSM) was prepared for the Site. The following bullets summarize the principal elements of the CSM:

- Buildings do not exist on the Phase One Property. Historical building foundations and other potential below-grade structures remain. No buildings were known to have basements; however, based on historical reports, pits and sumps were present throughout the foundry.
- Waterbodies do not exist within the Phase One Study Area. The closest water body to the Site is the Eramosa River, which is approximately 0.5 kilometres (km) southeast of the Site and travels 1.4 km before running into Speed River as shown on Figure 2-1 (Appendix D3).
- There are no areas of natural and scientific interest within the Phase One Study Area based on presently available information.
- No existing drinking water wells were identified on the Phase One Property. Thirty wells indicated as water supply or domestic use wells were identified within 1 km of the Site. The wells were found to be located outside the Phase One Study Area. Water wells within 1 km of the Site are shown on Figure 4-4.
- Figure 6-1 presents the roadways and land use within the Phase One Study Area.
- Based on the Phase One ESA, a number of PCAs occurred in the Phase One Study Area, which are summarized within the APECs in Table 7.3-1, and their locations shown on Figure 4-1a and Figure 4-1b (Appendix D3).
- Based on the Phase One ESA, 29 PCAs were identified onsite and have been identified as APECs. Four APECs associated with offsite PCAs within the Phase One Study Area have been interpreted to have the potential to impact the Phase One Property. The areas where these 33 APECs are interpreted to have potential impacts are shown on Figures 4-1a and 4-1b (Appendix D3).
- The COPCs identified within the Phase One Study Area include metals and inorganics, VOCs, PHCs, PAHs, PCBs, acid base neutral components (ABN) and chlorophenols. This list includes COPCs that are confirmed to be present based on historical investigations. Based on previous reports and contaminant concentrations, there is a potential for free phase product to exist on the Site.
- Although utilities have been disconnected onsite, piping and bedding have not been removed and, therefore, there is a potential for utility corridors to be providing a preferential route of contaminant migration.
- The Site topography varies from approximately 315 and 316.5 metres above sea level (masl) based on topographic information and previous investigations completed at the Site. The Site and surrounding lands generally slope southeast to the Eramosa River.
- Geology from previous investigations indicate subsurface materials consisting of fill (varying from 0.3 to 3.2 m deep), underlain by native silty fine sand. The approximate bedrock depth based on past investigations on the Site was 2.0 mbgs (elevation of 313.5 masl) and ranged from approximately 0.7 m to 3.4 mbgs (elevation of 312.7 to 315.0 masl). The bedrock was described as dolostone, grey, porous, and highly fractured with a rock quality index indicating it is highly weathered and fractured (Gartner Lee 1999).
- The regional geology indicates the Phase One Study Area consists of "silt to sandy silt matrix, becoming silt to silty clay near Lake Erie, strongly calcareous, moderate to low clast content decreasing southward" (OGS, 2000), and bedrock of the Guelph Formation, consisting of sandstone, shale, dolostone, siltstone (OGS, 1991). The bedrock elevation is approximately 305 masl based on *OGS Preliminary Map P.2224, Guelph Area, Southern Ontario, Bedrock Topography Series* (Karrow 1979).

- Groundwater levels at the Site have been measured during previous investigations between 2.02 and 4.13 mbgs (310.84 to 316.40 masl) with an inferred groundwater flow direction to the south, towards the Eramosa River.

This information has also been summarized in Table 7.4-1.

Based on the uncertainties documented in the Phase One ESA (CH2M 2017), it is possible that a PCA/APEC or land use has not been identified within the individual components of the Phase One ESA. Information was gathered from numerous sources (including aerial photographs, City Directories, database searches, historical reports, interviews, and site reconnaissance), which decreases the chance that a major PCA or land use was not identified in the Phase One ESA. Many aspects of the CSM have been previously studied and verified through subsurface investigations (for example, groundwater flow direction); these aspects are not directly affected by the noted uncertainties.

1.7 Phase One ESA Conclusions

Based on the findings of the Phase One ESA investigation (CH2M 2017), potential and confirmed impacts exist at Site, and a Phase Two ESA is required before an RSC can be filed. Previous subsurface investigations have been completed onsite and have documented that its subsurface quality does not meet O. Reg. 153/04 standards for potential redevelopment with more sensitive land uses. Additional subsurface characterization and associated environmental work is required before an RSC is filed.

Table 4.1.5-1. Summary of Environmental Reports

Phase One Environmental Site Assessment, 200 Beverley Street, Guelph

Report Title	Date	Author	Prepared for	Description [a]
Environmental Investigation, International Malleable Iron Company, 200 Beverley Street, Guelph Ontario	June 10, 1991	Proctor & Redfern Limited	The Bank of Montreal	An environmental investigation, including a background review, was conducted onsite that incorporated a preliminary investigation conducted by P&R in 1989. The background review included a title search, review of aerial photographs, FIPs, and building permits as supplied by the City of Guelph, discussions with municipal and MOECC personnel, and an interview with a former IMICO employee. The field program included excavating 55 test pits, advancing 5 boreholes (completed as monitoring wells) and completing 16 corehole locations in 1991. The test pit locations included central test pits (A to L in 1989, and 1 to 12) in areas of suspect soil contamination, excavated to clean native soil or bedrock, and an additional 31 shallow test pits to help delineate contaminants.
City of Guelph, Former IMICO Facility Demolition and Waste Removal Report	October 7, 1999	Earth Tech (Canada) Inc.	City of Guelph Works Department Engineering Services Division	Earth Tech (previously P&R) was retained to provide contract tendering and administration of the demolition of buildings and clean up of waste materials at the Site to address the Director's Order issued by the MOECC in 1994. Waste materials (ACM, PCB-containing material, liquid wastes, foundry sands, contaminated concrete) were removed from the Site and Remediation (excavation and disposal) was completed for two areas on the Site: the north east corner of the Site where a previous plating room was located, and the area of the capacitor rooms that formerly housed PCB capacitors. Removal activities in the capacitor room included removal of a concrete floor, a utility trench, a subfloor, and a sump that were all indicated as PCB-impacted; material was excavated and disposed offsite. The area was excavated to bedrock (1.0 - 1.3 mbgs) to remove concentrations above 5 µg/g. Final samples (composite soil, soil, concrete and bedrock) from the limits of excavation in the capactor room reported PCB concentrations under 5 µg/g, with the exception of two bedrock samples within the eastern sump area that had concentrations around 10 µg/g. Investigations by P&R and Gartner Lee indicated high concentrations of zinc, other metals, and oil and grease in the northeast corner of the Site. The area was excavated to bedrock (ranging from 1.3 to 2.0 mbgs and approximately 9,400 tonnes of contaminated soil and 925 tonnes of contaminated concrete were removed. Soil samples were collected from the final limits of the excavation walls and indicated some zinc and TPH concentrations above the Table A Guidelines. The excavation was backfilled with granular "B" materials. A single sample was collected from the backfill and met the guidelines at the time. Groundwater monitoring programs were recommended for areas downgradient of the capacitor room and northeast corner of the Site.
Supplemental Hydrogeological Investigation Former IMICO Site	March 8, 1999	Gartner Lee Limited	The City of Guelph	A hydrogeological site assessment was conducted that consisted of drilling eleven boreholes, installing nine monitoring wells (four in the bedrock) and collecting soil and groundwater samples. The stratigraphy over most of the Site was defined as coarse fill materials underlain by native silty fine sand. The depth of the fill materials ranged from 0.3 to 3.2 m from the southern to the eastern portions of the Site. Shallow groundwater flow was observed from the south to southwest, with a high around OW2. The average lateral velocity was measured at 107 m/yr. Flow in the bedrock was generally to the south with a velocity of 14 m/yr. Vertical gradients were downwards, with the exception of OW9 and OW11 where measurements indicated occassional upward gradients. Soils were found to be impacted with metals (mainly zinc and lead), TPH, VOCs and PAH/phthalates in the area immediately east of the former annealing room, with impacts found up to the top of bedrock (1.5 to 2.0 mbgs). Groundwater was found impacted with TPH (heavy oil), zinc, and lead which were primarily found at the northeast portion of the Site. Some localized exceedances of PAHs were also reported. Elevated chlorinated VOCs (specifically TCE and VC) were observed on the east property boundary (OW18 and OW19). NAPL was identified at OW21-1 within the dolostone bedrock which was determined to be fuel oil comprised of PAHs/phthalates. Suspected free product was previously observed in monitoring wells in the same area (OWI-1). The development of a remedial action plan was recommended.
Contaminant Investigation 490 York Road, Guelph, Ontario	May 12, 2004	Gartner Lee Limited	The City of Guelph	An investigation of the adjacent property at 490 York was conducted in a response to an MOECC Provincial Order (No. 7616-5LAL3S) from 2003 to better define groundwater quality and source of the VOC contamination at the east end of the IMICO site. Three pairs of monitoring wells (OW28, OW29, and OW30) were installed (shallow at approximately 6 m and deep at approximately 12 m), developed and sampled for analysis of major ions, metals, TPH, VOCs, PAHs, and general chemistry. It was noted in the report that groundwater at the northeast corner of the IMICO site may be influenced by water takings (industrial) at Holody, located 500 m to the northeast. Shallow groundwater was noted to flow to the southeast within the investigation area, likely influenced by the presence of the bedrock ridge. Other factors affecting the flow include buried services such as storm drains, low permeable surfaces (asphalt, buildings, concrete), and surface topography. It was noted in the report that groundwater at the northeast corner of the IMICO site may also be influenced by water takings (industrial) at Holody, located 500 m to the northeast. The stratigraphy was found to be composed of fill (up to 0.4 mbgs), native soil, and dolostone bedrock. The depth to bedrock ranged from 2.2 to 4.3 mbgs. Vertical gradients at the newly installed well nests were found to be downward. Chlorinated VOCs (TCE and degradation products), lead, and zinc were found in the groundwater on 490 York Road.

Table 4.1.5-1. Summary of Environmental Reports

Phase One Environmental Site Assessment, 200 Beverley Street, Guelph

Report Title	Date	Author	Prepared for	Description [a]
Phase I Environmental Site Assessment Former IMICO Property 200 Beverley Street, Guelph, Ontario	December 20, 2007	Decommissioning Consulting Services Limited	The City of Guelph	DCS conducted a Phase I ESA of the Site to prepare for its redevelopment, which required a subsequent Phase II ESA, and remedial action plan activities. The Phase I ESA consisted of a historical review of past land use (ERIS, aerials, ownership information), review of previous reports, and a site reconnaissance. The IMICO Site was determined to be first developed in 1912 as a foundry and was closed/abandoned in September 1989. The site reconnaissance provided limited information as there were no buildings/structures present. Information that was gathered from reports reviewed by DCS that were not available to CH2M are as follows: Philip Environmental - Earthtech Remedial Program 1989/1999 - included the decomissioning of wells OW01-I, OW01-II, OW20 and OW21 in the northeast corner of the site in April 1999, before the excavation of soil in the area. Gartner Lee Investigations 2000/2001 - included the installation of six monitoring wells in three locations (OW22S/D, OW23S/D and OW24S/D) following the excavation of impacted soils in the northeast corner of the property, and an additional well (OW25) in the vicinity of the remediated capacitor room. Additionally, nine test pits were advances in the southwestern portion of the property because of anomalies detected on the geophysical survey conducted. The anomolies were determined to be buried ferrous material. Soil sample collected indicated elevated zinc and TPH concentrations. Free product was noted in two of the shallow monitoring wells (OW22S and OW23S), which was found to be highly weathered with a slight oil/diesel odour. It was noted that the soil and groundwater conditions did not meet the background standards for metals, PHCs, and PAHs at many locations. Additional subsurface investigations were recommended in the following areas: - Current concentrations of the residual contamination at the eastern property boundary in soil and groundwater (metals, VOCs, PHCs); volatiles may have degraded from original concentrations - Further definition of the residual PCB contamination in the soil and groundwater in the vicinity of the capacitor room - Delineation of metal and occasional VOC impacts on the western site boundary - Investigation of groundwater impacts downgradient of the Site on Kingsmill Avenue
Phase II Environmental Site Assessment Former IMICO Property 200 Beverley Street, Guelph, Ontario	December 21, 2007	Decommissioning Consulting Services Limited	The City of Guelph	A total of 40 boreholes were advanced at the Site, with 10 locations completed with monitoring wells (BH07-40 through BH-71, OW07-31 through OW07-38). Two of the monitoring well locations had both a shallow (5 to 7 mbgs) and deep (10 mbgs) monitoring well installed at the location (OW-24 and OW36). Analytical results were compared to both the Table 1 and Table 2 Standards. Soil exceedances included metals (widespread), PHCs (eastern end of the property, in the vicinity of the former maintenance garage, and one sample south of the capacitor room; F3 the predominant fraction), limited VOC exceedances (BTEX, no chlorinated VOCs identified), PAHs, and PCBs (maintenance garage and south of the former capacitor room). Synthetic leach samples for metals, VOCs, PHCs, PAHs, and PCBs indicated concentrations of copper, lead, and zinc exceeding proposed criteria. Groundwater exceedances included metals (mainly zinc on the east property boundary), PHCs (northeast end of property and south of the capacitor room), VOCs (mainly chlorinated VOCs with the highest concentrations on the east end of the Site), PAHs, and PCBs (one south of the capacitor room). DCS concluded that given the nature of the soil and groundwater quality on the Site, an extensive soil remediation program would be required to clean up to generic standards for the property to be suitable for residential or parkland use. Additionally, they concluded if using a RA, the property boundaries would still need to meet MOECC potable groundwater standards.
Preliminary Remedial Action Plan Former IMICO Property 200 Beverley Street, Guelph, Ontario	March 6, 2008	Decommissioning Consulting Services Limited	The City of Guelph	Four main scenarios were considered for the preliminary remedial action plan: 1) Using applicable Table 1 Standards (background) 2) Completing a limited scope RA to allow for the use of Table 2 Standards (potable) 3) Completing a limited scope RA to allow for the use of Table 2 Standards and elevated zinc background values 4) Completing a full scope RA for the proposed site specific land use Option 1 required the remediation of approximately 80,000 cubic m3 of soil, Option 2 would reduce the remediation required to 54,000 m3 of soil, Option 3 would require 23,000 m3 of soil based on the evidence of elevated background zinc concentrations in the Guelph area. Option 4 assumes many soil impacts can be managed on site by risk management measures and limited soils would require removal. For groundwater, the western part of the Site indicated the most practical approach to be completing a limited scope RA to justify the use of Table 2 Standards and installation of recovery wells and a standby treatment system to prevent potential contamination migrating offsite. For the eastern portion of the Site, recommendations were for an ex situ groundwater remediation system, consisting of particle filter and granular activated carbon unit, was recommended to treat groundwater and discharge to the Guelph Sanitary Sewer. The particle filter would remove suspended particles that might contain metals, PAHs, PCBs, and PAHs, and the activated carbon would treat the VOCs. Further groundwater investigations were recommended as the potential for recontamination was likely high.
2010 Annual Groundwater Monitoring Report, Former IMICO Site, 200 Beverly Street, Guelph, Ontario	April 23, 2012	AECOM Canada Limited	The City of Guelph	AECOM (formerly Gartner Lee Limited) has been conducting semi-annual groundwater sampling and quarterly water level monitoring since 1998. The 2010 monitoring events occurred in March, June, October and December with groundwater samples collected in March and October. The groundwater wells in the monitoring well network included those installed offsite on 490 York Road, on Beverley Road, along the CP Rail property and on Simcoe Street, for a total of 18 shallow wells and 13 deep wells. Groundwater flow in the shallow aquifer was determined to be south to southwest, toward the Eramosa River. Deeper groundwater was measured at similar elevations across the site indicating little to no horizontal groundwater flow. LNAPL was measured in OW23 at 0.06 to 0.15m over the four monitoring events. Groundwater chemistry was compared to the Table 2 Standards for industrial/commercial/community property use. Inorganics found exceeding the standards were zinc, chloride and sodium; the chloride and sodium only occuring offsite at the 490 York Road property, likely because of road salting. Zinc was found in six wells, all along the eastern property boundary. PAHs exceeded standards offsite at 490 York Road, and at one location in each the central (OW25) and west (OW16) portion of the Site. PHCs and PCBs were elevated downgradient of the former capacitor room (OW25 and OW26S, respectively) during the 2010 event. The PCB concentration met Table 2 Standards used for comparison, but does not meet current Table 6 Standards. PHCs were also elevated offsite at 490 York Road (specifically F1, differing from the F2-F4 concentrations historically found on the Site) and had not been measured at OW22S or OW23S since 2007. Elevated VOCs included TCE, cis-1,2-DCE, 1,1-DCE, VC, and TCA and were mainly found at the eastern property boundary and on 490 York Road. The highest concentrations of TCE were found offsite at OW30D. Trend analysis indicated that TCE concentrations had mostly stabilized over time, with some wells showing a decreasing trend.

Table 4.1.5-1. Summary of Environmental Reports

Phase One Environmental Site Assessment, 200 Beverley Street, Guelph

Report Title	Date	Author	Prepared for	Description [a]
2011 Annual Groundwater Monitoring Report, Former IMICO Site, 200 Beverly Street, Guelph, Ontario	August 15, 2013	AECOM Canada Limited	The City of Guelph	The 2011 monitoring events occurred in June, September, and December, with sampling occuring in the first two events. Groundwater flow in the shallow aquifer was similar to previous events, deeper groundwater indicated a hydraulic high near OW23D. LNAPL was measured in OW23S at 0.04 to 0.15 m the four events. Groundwater exceedances for inorganics were found for zinc at seven wells and lead in one well. Chlorinated VOCs were similar to concentrations found in 2011, and TCE was noted to be decreasing. PAHs and PHCs were similar to previous years concentrations. PCBs were not analyzed and removed from the program in 2011, despite the last measured concentrations being above Table 6 Standards.
2012 & 2013 Annual Groundwater Monitoring Report, Former IMICO Site, 200 Beverley Street, Guelph, Ontario	March 21, 2014	AECOM Canada Limited	The City of Guelph	The 2012 and 2013 annual report included additional slug test for the offsite wells indicating hydraulic conductivities generally consistent with those measured onsite. Monitoring events reduced to semi-annually and occurred in June and December 2012 and August and October of 2013. Sampling reduced to annually and occurred in December 2012 and October 2013. Groundwater flow in the shallow aquifer was southerly similar to previous events; deeper groundwater indicated a hydraulic high presented near OW18-II. LNAPL was measured in OW23S between 0.03 to 0.08 m over the four events. Pressure transducers were installed in three well nests (OW18, OW27 and OW30) between August 23 and August 31, 2013 (Friday through Saturday) to observe any possible influence of the water takings from nearby wells. No precipication events occured during the period. Water fluctuations were measured in the shallow wells during 2 weekdays: up to 30 cm in OW27S and OW30S and up to 15 cm in OW18-I. Water levels remained steady in bedrock wells OW18-II and OW30D, but fluctuated daily beginning August 26 (Monday). The MOECC stated that Holody Electro Plating has a PTTW for up to 50 imperial gallons per minute, and the water taking occurs continuously during the work week. This pumping is likely affecting the water levels at the Site and may be influencing groundwater flow direction. Groundwater exceedances for inorganics were found for zinc at five wells. Overall, concentrations of chlorinated VOCs were consistent with results from 2011. Degredation products were plotted alongside the TCE concentrations plots. PHC exceedances occured onsite at OW25, OW22S, OW23S (product measured in this well) and offsite at OW36S and OW30D. PAHs were similar to previous years concentrations.
Phase One Environmental Site Assessment 200 Beverley Street, Guelph, Ontario	February 11, 2014	Decommissioning Consulting Services	The City of Guelph	A Phase One ESA was conducted by DCS to assess the existing site environmental conditions and identify environmental concerns that might affect the future use of the Site. A review of historical information including historical reports, aerials, MOECC documents, FIPs, chain of title information, historical databases were completed, as well as a site reconnaissance. Nine APECs were identified by DCS: 1) Fill of Unknown Quality 2) Former UST on the east portion of the Site 3a) Former Iron and Steel Processing including sand mixing and foundry sumps 3b) Former PCB-containing Capacitors in the Foundry 4) Former Metal Treatment, Coating and Finishing 5) Historical Garage, Maintenance and Repair Area on the western property boundary 6) Historical Use and Storage of PCBs in the northeastern portion of the property 7) Former Metal Treatment, Coating and Finishing 8) Chemical Manufacturing, Processing and Bulk Storage (North of the Site) 9) Guelph Rail Line Adjacent to the Site (North of the Site) COCs identified were metals, PHCs, BTEX, PCBs, PAHs, and VOCs. Previous investigations reviewed identified impacts from metals VOCs, PHCs, PAHs, and PCBs. Additional Phase Two work was recommended.
Phase Two Environmental Site Assessment Former IMICO Property 200 Beverley Street, Guelph, Ontario	April 2, 2014	Decommissioning Consulting Services	The City of Guelph	The DCS investigation included excavation of 10 test pits, advancing three boreholes; two of those locations additionally installed a monitoring well. Soil samples were collected for metals, VOCs, PHCs, PAHs, and PCBs. Groundwater samples were collected from the newly installed wells as part of the annual monitoring (AECOM). Groundwater flow was determined to be to the south in the shallow bedrock/overburden, and flow in the deeper bedrock appears to be somewhat radial from the east property boundary. Groundwater velocities in the two units were measured at approximately 15 m/yr and 55 m/yr; an upward gradient was found to be present in some wells. Soil was compared to the MOECC Table 6 Standards and indicated elevated metals across the property and localized exceedances of PAHs and PCBs. Groundwater was found with elevated concentrations mainly on the eastern portion of the Site consiting of VOC, specifically TCE and degredation products, and some PAHs.
Preliminary Remedial Action Plan Former IMICO Property 200 Beverley Street, Guelph, Ontario	April 14, 2014	Decommissioning Consulting Services	The City of Guelph	DCS completed a preliminary remedial action plan for the Site to prepare for its redevelopment. Viable options for soil management included an RA or MGRA in combination with some excavation and offsite disposal. Options for the groundwater were an RA or MGRA with localized free product removal and potential VOC remediation. The source and extent of free product in OW23S would need to also be determined. The presence of offsite impacts were also reported to need further investigation and agreement amoung the City, MOECC, and stakeholders on appropriate remedial measures or management of groundwater impacts.

Table 4.1.5-1. Summary of Environmental Reports

Phase One Environmental Site Assessment, 200 Beverley Street, Guelph

Report Title	Date	Author	Prepared for	Description [a]
2014 Annual Groundwater Monitoring Report, Former IMICO Site, 200 Beverly Street, Guelph, Ontario	April 30, 2015	AECOM Canada Limited	The City of Guelph	The 2014 annual monitoring included semi-annual events in July and October with groundwater sampling in October. Wells were re-surveyed accross the Site for top of pipe elevations, with some differences up to 0.45 m from original surveyed elevations, resulting in some minor changes in groundwater flow and hydraulic gradients. Groundwater flow in the shallow aquifer was southerly similar to previous events; deeper groundwater was reported as generally flat with a hydraulic high presented near OW18-II, as previously reported. LNAPL was measured in OW23S between 0.05 to 0.32 m during 2014. Vertical gradients were generally down, with the exception of OW9, OW11, OW30, OW07-34, and OW07-36, which had upwards hydraulic gradients in 2014. Groundwater exceedances for inorganics were found for zinc at four wells. Overall, concentrations of chlorinated VOCs were consistent with results from 2011, indicating TCE decreasing in the shallow aquifer. Degradation products were plotted alongside the TCE concentrations plot and show concentrations increasing in the deeper wells as expected because of downward flow and anaerobic degredation of TCE in bedrock. PHC and PAHs were similar to previous years' results.
Vertical Delineation of the Extent of Groundwater Impacts at the Former IMICO Site, 200 Beverley Street, Guelph, Ontario	December 8, 2016	WSP Canada Inc.	The City of Guelph	WSP conducted a vertical delineation investigation at the Site to address the concern that over the years concentrations of TCE and related degredation products have been increasing at the northeastern wells. The presence of shalllow porous fractured bedrock (Guelph Formation) has contributed to the migration of TCE and degredation products to deeper depths. The investigation included the installation of a telescopic bedrock monitoring well within an area where identified dense NAPL (TCE and degredation products) were found in the groundwater, in the north east corner of the Site. The well was drilled, cored, and sealed to 29 m, with an open hole left at 29 to 33 m. Geologic features and competent bedrock formations were reported. The Site is underlain by the Lockport Group, consisting of the Guelph Formation, Eramosa Formation, Goat Island Formation, and the Gasport Formation. The Guelph Formation, which is noted to be a major regional aquifer, has a flow from the north to south and discharge points to the Speed and Eramosa Rivers. The Eramosa Formation is considered a regional aquitard and is a semi-confining unit because of vertical and horizontal fractures. The lower portion of this formation (the Vinemount Member) is considered a better aquitard. The region draws water from two major zones: the upper fractured weathered portion of the bedrock and the deeper highly fractured porous Gasport Formation. Groundwater samples were collected during the drilling and run through a handheld gas chromatograph as well as submitted to a lab for PHC and VOC analysis. TCE was found up to approximately 24 m within the Eramosa formation.The highest concentrations of TCE (432 µg/L) and cis-1,2-DCE (244 µg/L) were reported from approximately 9 to 12 m. Degradation products were found in the final investigated depth in the Goat Island Formation above the Table 1 Standards. PHC exceedances were also noted, but were noted to be likely related to the natural presence of hydrocarbons in the Guelph and Eramosa Formations.
2015 Annual Groundwater Monitoring Report, Former IMICO Site, 200 Beverly Street, Guelph, Ontario	January 31, 2017	AECOM Canada Limited	The City of Guelph	The 2015 annual monitoring included semi-annual events in September and November with groundwater sampling in November. Groundwater flow in the shallow aquifer was southerly, similar to previous events; deeper groundwater is reported as generally flat with a hydraulic high presented near OW18-II, as previously reported. LNAPL was measured in OW23S between 0.032 to 0.05 m during 2015 and a total of 650 mL of product was purged from the well over two events. Vertical gradients are generally down, with the exception of upwards gradients observed at one or more events for OW9, OW11, OW26, OW07-34, and OW07-36. Groundwater exceedances for inorganics were found for zinc at five wells. Overall, concentrations of chlorinated VOCs were consistent with results from 2011, indicating TCE decreasing in the shallow aquifer. Degradation products were plotted alongside the TCE concentrations plot and show concentrations increasing in the deeper wells as expected because of downward flow and anaerobic degredation of TCE in bedrock. PHC and PAHs were similar to previous years results.
2016 Annual Groundwater Monitoring Report, Former IMICO Site, 200 Beverly Street, Guelph, Ontario	June 26, 2017	AECOM Canada Limited	The City of Guelph	The 2016 annual monitoring included semi-annual events in August and October with groundwater sampling in October. Groundwater flow in the shallow aquifer was southerly similar to previous events; deeper groundwater is reported as generally flat with a hydraulic high presented near OW30D, where groundwater flows in a northeasterly direction. LNAPL was measured in OW23S between 0.04 and 0.02 m during 2016 and approximately 200 millilitres of product was purged from the well over two events. Vertical gradients are generally down, with the exception of upwards gradients observed at one or more events for OW9, OW11, OW26, OW30, OW07-34, OW07-36, and OW13-39. OW27S/D were not sampled, as there was significant damage to the well casing and PVC pipes by road construction on Simcoe Street. Groundwater exceedances for inorganics were found for zinc at three wells. Overall, concentrations of chlorinated VOCs were consistent with results from 2011, indicating TCE decreasing in the shallow aquifer. Degradation products were plotted alongside the TCE concentrations plot and show concentrations increasing in the deeper wells as expected because of downward flow and anaerobic deredation of TCE in bedrock. PAHs were similar to previous years results. PHCs were similar with the exception of OW22S, OW23D, and OW30D, which had an increase in concentrations.

Notes:

[a] Historical data from previous reports have been summarized in Sections 4.1.5.2 for Soil and Section 4.1.5.3 for Groundwater; Data is also presented on Figures 4-2a through 4-2f for soil, and 4-3a through 4-3f for groundwater.

µg/g = microgram(s) per gram
µg/L = microgram(s) per litre
ACM = asbestos-containing material
APEC = area of potential environmental concern
BTEX = benzene, toluene, ethylbenzene, and xylene
cm = centimetre(s)
COC = contaminant of concern
DCE = dichloroethylene
ESA = environmental site assessment
FIP = fire insurance plan
IMICO = International Malleable Iron Company
LNAPL = light nonaqueous phase liquid
m = metre(s)
m^3 = cubic metre(s)
m/yr = metre(s) per year
mbgs = metre(s) below ground surface
MGRA = modified generic risk assessment
MOECC = Ministry of the Environment and Climate Change, formerly the Ministry of the Environment
NAPL = non-aqueous phase liquid
P&R = Proctor & Redfern
PAH = polycyclic aromatic hydrocarbon
PCB = polychlorinated biphenyl
PHC = petroleum hydrocarbons
PTTW = permit to take water
RA = risk assessment
TCA = trichloroethane
TCE = trichloroethylene
TPH = total petroleum hydrocarbons
UST = underground storage tank
VC = vinyl chloride
VOC = volatile organic compound

Table 7.1-1. Current and Past Land Uses for Phase One Property

Phase One Environmental Site Assessment, 200 Beverley Street, Guelph, ON

Year	Name of Owner	Name of Occupant	Inferred Description of Property Use	Inferred Property Use (according to Regulatory Types)	Other Observations (for example, from Aerial Photograph and Fire Insurance Plans) [a]
1997 - present	City of Guelph	No occupant	Vacant	Industrial	Aerials show the Site buildings demolished between 1998 and 2006 and the Site vacant thereafter
1993 - 1997	The Assembly of the Church of the Universe	The Assembly of the Church of the Universe	Unknown	Institutional/ Industrial	Aerials during this time show damage (assumed from fires) to the buildings on Site
1992 - 1993	John H. Long	John H. Long/Unknown	Storage	Industrial	No additional information available for this time period
1913 - 1992	International Malleable Iron Company Limited	International Malleable Iron Company Limited	Iron-jobbing Foundry	Industrial	Aerials, FIPs show industrial use through this time period; previous reports indicate operations ceased in 1989
1834 - 1913	Various	Owner or unknown	Agricultural or Residential	Agricultural or Residential	Private individuals were listed in the Title Search; no aerials were available before 1930, and no FIP coverage was available for the area prior to 1916

[a] Additional information was obtained from the City Directories, Title Search, site observations, interviews and aerial photographs documented in this report.

Notes:

FIP = fire insurance plan

Table 7.3-1. Areas of Potential Concern

Phase One Environmental Site Assessment, 200 Beverley Street, Guelph, Ontario

Areas of Potential Environmental Concern (APEC) ID		Location of APEC	Potentially Contaminating Activity (PCA)[a]		Location of PCA [b]	Contaminants of Potential Concern (based on AP method groups) [c]	Media Potentially Impacted (groundwater and/or soil)
APEC-1	Foundry - A foundry was operated on the site by IMICO from 1913 to 1989 when the plant closed and was abandoned. The foundry operated as an iron-jobbing facility for the production of various metallic forms using malleable and ductile iron (DCS, 2014). Foundry sands were predominantly located in the concrete pits and sumps of the main Foundry building. Foundry sands, sludge materials, and process waste were removed from the site and buildings were demolished in 1999 (Earth Tech, 1999). The P&R investigation also reported that moulding sands and dust collector waste was stored at the north west corner of the building and drained to the truck bay (P&R, 1991).	Central portion of the Site	32	Iron and Steel Manufacturing and Processing	Onsite	VOCs, PHCs, PAHs, ABNs, CPs, metals	Soil and Groundwater
APEC-2	Machine Shop - A machine shop was shown on the 1916 FIP, east of the original foundry. The northern one-third of the Machine Shop was identified for 'Tumbling and Cleaning' operations, inferred to be in association with the adjacent 'Annealing Room' to the north. FIPs prepared in 1929, 1945 and 1960 showed this area changed operations to 'Shipping' and a 'Pattern Shop'.	East end of the Site	34	Metal Fabrication	Onsite	VOCs, PHCs, PAHs, metals	Soil and Groundwater
APEC-3	Annealing - An 'Annealing Room' with four furnaces is shown on the 1916 FIP. A brick chimney is located on the north wall. The 1929 FIP shows nine furnaces with the Annealing Room extended westward with an additional chimney on the north wall within the extended area; the southern portion of the Annealing Room is identified as the 'Tumbling Dep't'. The 1946 FIP shows a structural addition on the east side of the Annealing Room, with two additional furnaces. The 1960 FIP shows further eastward expansion and the addition of a third furnace. Tumbling Dep't operations appear consistent in location and footprint, from 1929 through to 1960. The furnaces are inferred to be coal fired from 1916 through to 1960, based on the nearby coal storage areas shown on the 1946 and 1960 FIPs, and the absence of ASTs or USTs for fuel oil storage on any of the FIPs. The furnace fuel from after 1960 to the end of operations in 1989 is not known, but a period of fuel oil fired operation of the furnaces is suspected; see APEC 7. No information was identified to suggest coal or fuel oil storage within the Annealing Room; however, no information regarding temporary furnace fuel storage, transmission or waste disposal was identified. Dust control equipment is shown on Figure 4 of the 1991 P&R report, on the north side of the Annealing Room.	East end of the Site	32	Iron and Steel Manufacturing and Processing	Onsite	VOCs, PHCs, PAHs, metals	Soil and Groundwater
APEC-4	Sand Storage - The 1916 FIP shows a 'Sand Shed'. The 1929 and 1946 FIPs again show the Sand Shed, plus a second smaller building to the west labelled 'Sand'. The 1960 FIP shows the original 'Sand Shed' as 'Bricks' and the second smaller building to the west labelled as 'Sand & Bricks', and an additional area to the north labeled 'Sand'. No information was identified to if only clean process, spent foundry sands or both were stored in these buildings, therefore the potential storage of spent foundry sand in these buildings is considered. The purpose and types of bricks stored was not identified. The potential for new and used refractory brick and associated process materials is considered possible.	Central portion of the Site	32	Iron and Steel Manufacturing and Processing	Onsite	PAHs, ABNs, CPs, metals	Soil and Groundwater
APEC-5	Galvanizing Building - A small free standing building for 'Galvanizing' was present on the south east portion of the Site as shown on the 1916, 1929 and 1946 FIPs. The Galvanizing building was not shown on the 1960 FIP, with the area occupied by a larger new structure identified as 'Fittings Whse' (warehouse). No information was identified regarding process chemical use and storage, or waste management practices, in association with the galvanizing operations conducted.	Southeast end of the Site	33	Metal Treatment, Coating, Plating and Finishing	Onsite	VOCs, PHCs, PAHs, metals	Soil and Groundwater
APEC-6	Chipping/Grinding Room - A 'Chipping Room' was shown on the FIPs prepared in 1929, 1946 and 1960, located west of the Annealing area. The 1916 FIP shows this as exterior yard area west of the 'Annealing Rm', with a small outbuilding that appears to be connected to the Annealing Room with a linear underground feature. The 1991 P&R report identified this as a 'Trimming and Grinding' area; this information inferred to be based on the interview of historical IMICO employees. 'Dust control equipment' is shown on Figure 4 of the 1991 P&R report, on the exterior west side of the building.	Central portion of the Site	34	Metal Fabrication	Onsite	Metals	Soil and Groundwater
APEC-7	Oil Houses, Boiler House and ASTs - A building is shown on the 1929 FIP to the north of the Foundry and east of the power house with a label "Oil", and an additional building with the same label is shown to the north of this original building on the 1946 FIP. The 1960 FIP shows the north building remaining, but is not labeled as an oil house. The 1916 FIP shows this as empty exterior yard area north of the foundry. The P&R Investigation figures show a boiler house to the east of the power house, and two 45,000-L (10,000 gallon) oil tanks to the east of the building with "no history of leaks or spills" (P&R, 1991). One 45,000-L AST was reported removed in 1998 during demolition activities and had been used to store Bunker C fuel. The AST removed had been located east of the Core Room (Earth Tech, 1999).	Central portion of the Site	28	Gasoline and Associated Products Storage in Fixed Tanks	Onsite	BTEX, PHCs	Soil and Groundwater

Table 7.3-1. Areas of Potential Concern

Phase One Environmental Site Assessment, 200 Beverley Street, Guelph, Ontario

Areas of Potential Environmental Concern (APEC) ID		Location of APEC	Potentially Contaminating Activity (PCA)[a]		Location of PCA [b]	Contaminants of Potential Concern (based on AP method groups) [c]	Media Potentially Impacted (groundwater and/or soil)
APEC-8	Gasoline UST - As indicated on the 1960 FIP, a gasoline UST is shown north of a small office building, and west of 'scales' at the corner of Kingsmill Avenue and Beverley Street. The area is empty exterior yard area on the 1916 FIP, and the 1929 and 1946 FIPs show the office (labeled as a 'time office'), but does not show the UST. The gasoline use is not known, however it is inferred to be for fueling gasoline-powered equipment/vehicles used at the plant. The 1991 Proctor & Redfern investigation reported that an IMICO employee indicated the UST was removed in the mid-1980s in response to a request from the City due to gasoline vapours in the sewers along Beverley and York Streets. No significant contamination was reported (P&R, 1991).	Southeast end of the Site	28	Gasoline and Associated Products Storage in Fixed Tanks	Onsite	VOC, PHCs, PAHs, metals	Soil and Groundwater
APEC-9	Oil House - A building is shown on the 1929 and 1949 FIP to the south of the Foundry and west of the galvanizing building with a label "Oil". The building/structure is not on 1916 FIP where the area is shown as exterior yard area, and is not present on the 1960 FIP where the area is occupied.	Southeast end of the Site	28	Gasoline and Associated Products Storage in Fixed Tanks	Onsite	BTEX, PHCs	Soil and Groundwater
APEC-10	Machine Shop - A machine shop is shown on the 1929, 1946 and 1960 FIP, east of the original foundry building. The floor is indicated as concrete. Machine shop cuttings were stored on the ground north of the building, and two small ceiling mounted oil tanks were present in the building as noted in the P&R investigation (1991). The area is shown on the 1916 FIP as exterior yard area, with a small unidentified building in the central area of the future machine shop. The north portion of the machine shop was removed during the 1999 excavation based on the excavation footprint (EarthTech, 1999).	East end of the Site	34	Metal Fabrication	Onsite	VOCs, PHCs, PAHs, metals	Soil and Groundwater
APEC-11	Plating/Galvanizing Building - A galvanizing building was present on the Site as shown on the 1946 and 1960 FIP. The previous FIPs (1916 and 1929) show this as exterior yard area. On subsequent site plans (P&R, 1991; Earth Tech 1999), the building was identified as a storage shed and reported as having been used for dip galvanizing before 1975, with rinse water discharged into "dry wells" north of the building (P&R, 1991). Investigations by P&R and Gartner Lee indicated high concentrations of zinc, other metals, and oil & grease. Free product was observed wells (OW01-I, OW20, OW21). The area was excavated to bedrock (ranging from 1.3 to 2.0 mbgs and approximately 9,400 tonnes of contaminated soil and 925 tonnes of contaminated concrete were removed. Soil samples were collected from the final limits of the excavation walls and indicated most locations having zinc and TPH concentrations above the Table A Guidelines. The excavation was backfilled with granular "B" materials. A single sample was collected from the backfill and met the guidelines applicable at the time of the report (Earth Tech, 1999). A well nest (OW22S/D) was installed within the excavation area (the report for this installation was not available and therefore the soil conditions are unknown if analyzed as part of the investigation). Testpits and boreholes installed in the area in 2013 by DCS indicated soils having high zinc and other metal concentrations. Groundwater conditions at OW22S reported free product which was highly weathered with a slight oil/diesel odour (as reported in the summary of the Gartner Lee 2000/2001 investigation in DCS, 2007a). Borehole logs for OW22S/D indicate the presence of fuel/diesel type odour in the fill which extends to approximately 1.5 mbgs; and hydrocarbon odour extending into the underlying bedrock with black staining on fractures. Groundwater sampled from OW22S has not since reported free product, but has had concentrations of PHCs increasing since the annual monitoring at this location began in 2016, up to 850,000 ug/L of F3. Zinc concentrations have widely fluctuated over the years and have exceeded in approximately 25% of the sampling events between 2005 and 2016.	Northeast end of the Site	33	Metal Treatment, Coating, Plating and Finishing	Onsite	VOCs, PHCs, PAHs, metals	Soil and Groundwater
APEC-12	Coal Storage - A coal shed is shown on the 1946 FIP, to the north of the foundry and west of the powerhouse. A larger coal storage area is shown on the 1960 FIP, and the building is extended south to connect with the foundry on subsequent site plans (P&R, 1991; GLL, 1999; Earth Tech 1999) without an indication of its use. The previous FIPs (1916 and 1929) show this area as exterior yard area.	Central portion of the Site	8	Chemical Manufacturing, Processing and Bulk Storage	Onsite	PAHs	Soil and Groundwater
APEC-13	Rail Line - A former rail line was shown onsite north of the buildings on the 1916, 1929 and 1946 FIPs, running east to west, for the full length of the foundry building. On the 1960 FIP, the western portion was shown to have been removed, to accommodate the newly constructed shipping/stock room; the rail siding ended at the eastern side of the building. It is inferred that raw materials and finished products were shipped by rail.	Central to northeast end of the Site	46	Rail Yards, Tracks and Spurs	Onsite	PAHs, metals	Soil and Groundwater
APEC-14	Possible Automobile Storage, Maintenance and Repair - An addition south of the foundry building, on the east side of the offices, is labeled "Auto" on the 1960 FIP. Previous FIPs (1916, 1929, 1946) show this as exterior yard area.	South end of the Site	27	Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation	Onsite	VOCs, PHCs, PAHs, metals	Soil and Groundwater
APEC-15	Sand Mixing/Storage - Sand mixing is shown in a building north of the foundry as shown on the 1960 FIP. Previous FIPs (1916, 1929, 1946) show this as exterior yard area, north of the foundry. Subsequent site plans (P&R, 1991; GLL, 1999; Earth Tech 1999) do not have an indication of the buildings use.	Central portion of the Site	8	Chemical Manufacturing, Processing and Bulk Storage	Onsite	PHCs, PAHs, ABNs, CPs, metals	Soil and Groundwater

Table 7.3-1. Areas of Potential Concern

Phase One Environmental Site Assessment, 200 Beverley Street, Guelph, Ontario

Areas of Potential Environmental Concern (APEC) ID		Location of APEC	Potentially Contaminating Activity (PCA)[a]		Location of PCA [b]	Contaminants of Potential Concern (based on AP method groups) [c]	Media Potentially Impacted (groundwater and/or soil)
APEC-16	Transformers - Transformers are first shown on the 1960 FIP, north of the powerhouse. Previous FIPS (1916, 1929, 1946) show this as exterior yard area north of the power house. Transformers of this era may have contained PCBs.	Central portion of the Site	55	Transformer Manufacturing, Processing and Use	Onsite	PHCs, PCBs	Soil and Groundwater
APEC-17	Capacitor Room - PCB-containing capacitors were present in the centre of the foundry, as first shown on the P&R investigationsite plan, and later remediated as part of the Earth Tech demolition (P&R, 1991; EarthTech, 1999). Activities included removal of a concrete floor, a utility trench located in the eastern section (concrete walls, granular base) that was heavily stained, a subfloor was present in the central section, and a sump located in on the eastern portion of the capacitor room that were all indicated as PCB-impacted and excavated and disposed offsite. The area was excavated to bedrock (1.0 - 1.3 mbgs) to remove concentrations above 5 ug/g. Final samples (composite soil, soil, concrete and bedrock) from the limits of excavation in the capacitor room reported PCB concentrations under 5 ug/g, with the exception of two bedrock samples within the eastern sump area that had concentrations around 10 ug/g. A well (OW25) was installed within the excavation area (the report for this installation was not available and therefore the soil conditions are unknown if analyzed as part of the investigation) and subsequent groundwater monitoring of the area have indicated concentrations of chlorinated VOCs and PHCs (mainly F3) above the applicable potable water criteria (Table 6 Standards) (DCS, 2007b, 2014b; AECOM, 2017a and 2017b).	Central portion of the Site	55	Transformer Manufacturing, Processing and Use	Onsite	PCBs, PHCs	Soil and Groundwater
APEC-18	Coal Storage - A building for coal storage is shown on the 1960 FIP, to the north of the annealing room, with additional 'coal piled' to the west of the building. Previous FIPs (1916, 1929, 1946) show this as exterior yard area to the north of the annealing room. The coal is inferred to be used in the furnaces in the annealing room. Subsequent site plans show this as a storage area (P&R, 1991, DCS, 2007a).	Northeast end of the Site	8	Chemical Manufacturing, Processing and Bulk Storage	Onsite	PAHs	Soil and Groundwater
APEC-19	Coal Storage - A small building for coal storage is shown on the 1960 FIP, east of the time keepers office at the Beverley Street entrance. The building is not present on previous FIPs (1916, 1929, 1946) and is shown as exterior yard area.	Southeast end of the Site	8	Chemical Manufacturing, Processing and Bulk Storage	Onsite	PAHs	Soil and Groundwater
APEC-20	Garage - A garage was shown on the 1946 and 1960 FIP along Stevenson, on the west side of the property. The building is not present on previous FIPs (1916, 1929) and is shown as exterior yard area. The site investigation by P&R (1991) identified visual impacts to the soils south of the garage. Some elevated PCB concentrations were found in soil during subsequent investigations.	West end of the Site	27	Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation Vehicles	Onsite	VOCs, PHCs, PAHs, metals, PCBs	Soil and Groundwater
APEC-21	Coal Storage - The 1960 FIP indicates coal storage south of the garage on the west side of the Site. The building is not present on previous FIPs (1916, 1929) and is shown as exterior yard area, and on the 1946 FIP, the building is not labeled as coal.	West end of the Site	8	Chemical Manufacturing, Processing and Bulk Storage	Onsite	PAHs	Soil and Groundwater
APEC-22	Transformer - A 1200-volt transformer is shown on the 1991 Site Plan (P&R, 1991).	Southwest end of the Site	55	Transformer Manufacturing, Processing and Use	Onsite	PHCs, PCBs	Soil and Groundwater
APEC-23	Paint Shop - First shown on the P&R Site plan, a paint shop was located at the north end of the site, between the shipping building and the storage area (P&R, 1991). Drums were stored against the north wall for materials used in the paint shop. The FIPs show this area as exterior yard area in the early FIPs (1916, 1929, 1946) and empty space between existing buildings in the 1960 FIP.	Northeast end of the Site	39	Paints Manufacturing, Processing and Bulk Storage	Onsite	VOCs, PHCs, PAHs, metals	Soil and Groundwater
APEC-24	PCB Storage Area - An area located at the northeast corner of the finishing and annealing room, with a concrete pad was identified in the Earth Tech investigation as a former PCB Storage area. Concentrations above 50 ppm of PCBs were identified. Previous site maps showed this area as 'storage' (P&R, 1991) or part of the Annealing Room (1946 and 1960 FIPs). During the demolition activities, approximately 250 kg of PCB-containing ash residue from the top of the concrete pad, and the concrete pad itself was removed and taken for offsite disposal (Earth Tech, 1999). Confirmatory samples below the pad were 0.63 and <0.05 ug/g. The soil was later excavated to bedrock as part of the soil remediation in the northeast corner of the property (see APEC-11).	Northeast end of the Site	55	Transformer Manufacturing, Processing and Use	Onsite	PHCs, PCBs	Soil and Groundwater
APEC-25	Drum Storage - Interviews with former employees as part of the P&R investigation identified drum storage activities which occurred along the north property boundary (P&R, 1991). No additional information was provided on the nature of what was stored and whether there was any associated contamination as a result of the materials.	North end of the Site	8	Chemical Manufacturing, Processing and Bulk Storage	Onsite	VOCs, PHCs, PAHs, metals	Soil and Groundwater
APEC-26	Former Substation - A former substation is indicated on the P&R (1991) and Earth Tech (1999) site plans. A sample of transformer oil from the former substation analyzed in the Earth Tech report indicated non-detect concentrations of PCBs. Similarly one location installed during the DCS Phase II ESA (2007) indicated non-detect PCB concentration. Previous site plans (FIPs) show this area as exterior yard areas.	West end of the Site	55	Transformer Manufacturing, Processing and Use	Onsite	PHCs, PCBs	Soil and Groundwater

Table 7.3-1. Areas of Potential Concern

Phase One Environmental Site Assessment, 200 Beverley Street, Guelph, Ontario

Areas of Potential Environmental Concern (APEC) ID		Location of APEC	Potentially Contaminating Activity (PCA)[a]		Location of PCA [b]	Contaminants of Potential Concern (based on AP method groups) [c]	Media Potentially Impacted (groundwater and/or soil)
APEC-27	Former Electrical Shop - A small electrical shop was noted to be on the southwest corner of the foundry (P&R, 1991). This addition was not shown on the FIPs from previous years, and was shown as the exterior yard area west of the foundry.	Southwest end of the Site	34	Metal Fabrication	Onsite	VOCs, PHCs, PAHs, metals	Soil and Groundwater
APEC-28	Waste Oil Storage - Used oil was stored above ground on the southwest end of the foundry as shown on the P&R Site Plan (P&R, 1991).	Southwest end of the Site	28	Gasoline and Associated Products Storage in Fixed	Onsite	VOCs, PHCs, PAHs, metals	Soil and Groundwater
APEC-29	Fill of Unknown Quality - All areas of the Site have a layer of fill above the native silty sands. Previous investigations have indicated a layer of fill consisting of foundry sands, slag and cinders (up to 1.0 m) was found across the site (P&R, 1991) and the fill to be mix of foundry operation waste such as "coal, clinker, ash, metals and detritus from the former foundry operations" and reworked native from "reworking onsite soils as a result of initial construction and subsequent expansion activities" (DCS, 2007b). The yard areas were additionally noted to have been oiled (presumably engine oil) (P&R, 1991).	Entire Site	30	Importation of Fill Material of Unknown Quality	Onsite	BTEX, PHCs, PAHs, ABNs, CPs, metals, PCBs	Soil and Groundwater
APECs from Offsite PCAs to the North							
APEC-30 (Offsite North)	Rail Lines - Bordering the north side of the Site, rail lines are present (owned by Guelph Rail Line) and have existed since at least the early 1900s. Has historically been indicated as the Canadian Pacific Railway (1916, 1929, 1946, 1960 FIPs and P&R [1991]), Guelph Junction Railway (EarthTech, 1999; DCS, 2007a).	Along Northern Property Boundary	46	Rail Yards, Tracks and Spurs	Offsite	VOCs, PHCs, PAHs, ABNs, CPs, metals	Groundwater
	Paper Manufacturing - Companies at 309 Elizabeth Street have been listed in the Scott's Manufacturing Directory for paper related manufacturing: Trinity Graphics was established in 1977 and 1978 with a plant sizes of 3,000 and 50,000 m^3 for paper bag and coated and treated paper manufacturing, all other converted paper product manufacturing, platemaking and related services; Independent Paper Converters was established in 1978 with a plant size of 56,000 m^3 for manufacturing including paper bag, coated and treated paper, plastic film and sheet. The 1960 FIP indicated gummed paper manufacturing (Top Paper Products).	309 Elizabeth Street	45	Pulp, Paper and Paperboard Manufacturing and Processing	Offsite		Groundwater
	Auto Body Repair Shop - An automobile wrecking and recycling record was listed in the ERIS report for Sutton Auto Collision at 349 Elizabeth Street, which is an autobody repair facility. Additionally Top Gun Auto Painting & Collision is listed at this address from the City Directory.	349 Elizabeth Street	10	Commercial Autobody Shops	Offsite		Groundwater
	Automobile Repair - Two automotive repair shops are listed in the City Directory at 349 Elizabeth Street from approximately 2005.	349 Elizabeth Street	27	Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation	Offsite		Groundwater
	Gasoline Station - A private fuel outlet with a 2,250 L liquid fuel double walled AST for gasoline is listed in the ERIS report for Oaks Precast Ind. Div. Standard Ind. at 351 Elizabeth Street with a license issue date of 1990. An additional record indicates a tank capacity of 36,500 L.	351 Elizabeth Street	28	Gasoline and Associated Products Storage in Fixed Tanks	Offsite		Groundwater
	Trucking Company - A general freight trucking company (Polymer Distribution Inc.) is listed at 351 Elizabeth Street.	351 Elizabeth Street	11	Commercial Trucking and Container Terminals	Offsite		Groundwater
	Concrete Products Manufacturing - Lafarge Canada Inc. is listed at 351 Elizabeth Street, with a Scott's Manufacturing directory listing indicating an established date of 1933 and plant size of 50,000 ft^3.	351 Elizabeth Street	12	Concrete, Cement and Lime Manufacturing	Offsite		Groundwater
	Plastic Products Manufacturing - ERIS and the City Directory searches indicate plastic products manufacturing at 53 Victoria Rd S. Scott's Manufacturing directory listings indicate Sterling Creations was established in 1983 with a 5,000 ft^2 plant size, as well as Clear Choice Window Manufacturing established in 1990 with a 1,600 ft^2 plant size.	53 Victoria Rd S	43	Plastics (including Fibreglass) Manufacturing and Processing	Offsite		Groundwater
	Wire/Spring Manufacturing - ERIS searches list records for Guelph Wire Products which was established in 1974, plant size of 4,000 ft^2 and manufactures steel springs, wire springs and miscellaneous fabricated wire products.	53 Victoria Rd S	34	Metal Fabrication	Offsite		Groundwater
	Metal Valve Manufacturing - ERIS searches list records for DeNardis Industrial Sales Ltd. at 61 Victoria Rd S Unit C for metal valve manufacturing, established in 1985, plant size 4000 ft^2.	61 Victoria Rd S	34	Metal Fabrication	Offsite		Groundwater
	Former Spill - Spill records from ERIS indicated a release of diesel fuel in 2005 at 65 Victoria South.	65 Victoria Rd S			Offsite		Groundwater
	Electro-plating company - Holody Electro-Plating Limited is listed at 66 Victoria associated with metal product coating, iron and steel mills and ferro-alloy manufacturing since at 1955, with a plant size of 40,000 ft^2 according to available records from ERIS. The 1960 FIP showed labeled buildings for plating, polishing, and an office.	66 Victoria Rd S	33	Metal Treatment, Coating, Plating and Finishing	Offsite		Groundwater
	Window and Door Manufacturing - Clear Choice Window Manufacturing Inc. and Richview Doors Ltd are listed in the Scott's Manufacturing Directory; established in 1990, and a 1,600 ft plant size. A spill at 75 Victoria Road South of a polymer emulsion (100lbs) in 2016 was reported.	75 Victoria Rd S	43	Plastics (including Fibreglass) Manufacturing and Processing	Offsite		Groundwater

Table 7.3-1. Areas of Potential Concern

Phase One Environmental Site Assessment, 200 Beverley Street, Guelph, Ontario

Areas of Potential Environmental Concern (APEC) ID		Location of APEC	Potentially Contaminating Activity (PCA)[a]		Location of PCA [b]	Contaminants of Potential Concern (based on AP method groups) [c]	Media Potentially Impacted (groundwater and/or soil)
	Scrap Yard - B&F Scrap Dealers are listed at 100 Victoria Road South, with an automobile wrecking and recycling record in ERIS and listings in the city directory search from 1970 to 2011. A spill was reported at the property of a gasoline and water mixture (quantity not specified) in 2006 from cargo leaking to the ground.	100 Victoria Rd S	49	Salvage Yard, including automobile wrecking	Offsite		Groundwater
APECs from Offsite PCAs to the East							
APEC-31 (Offsite East)	Steel Valve Manufacturing - Guelph Engineering Co. was shown located at 10 Kingsmill Avenue, buildings on the 1960 FIP indicate steel valve manufacturing with a machine shop, pattern shop and oil house. Previous FIPs (1916, 1929 and 1946) show residences in this area.	10 Kingsmill Avenue	32	Iron and Steel Manufacturing and Processing	Offsite	VOCs, PHCs, PAHs, ABNs, CPs, metals, PCBs	Groundwater
	Former Stove Manufacturer/Foundry - Guelph Stove Company was shown at 490 York Road on the 1916, 1929, 1946 and 1960 FIPs. Buildings included a foundry, storage (coke, coal, sand), milling room, pattern shops, plating and buffing, offices, warehouses, steel mounting room & blacksmith, crating, stove mounting, and oil. Transformers are shown on the enamel building. Operations existed until approximately the mid-1960s where the city directory listings indicate Franklin Manufacturing Co (Canada) LTD and then Resco Refrigeration Supplies Co LTD from approximately 1970. The facility became a multi-tenant commercial companies from the 1990s to present.	490 York Road	32	Iron and Steel Manufacturing and Processing	Offsite		Groundwater
	Box Manufacturing - Packing manufacturers are listed at 136 Victoria Road South: Ellis Packing West Inc. listed as a corrugated and solid fibre box manufacturer; and ABCO Box and Carton Ltd. listed as a folding paperboard box manufacturer, established in 1946 with a plant size of 40,000 ft^2. The 1960 FIP shows ABCO Box and Carton Co. Ltd with buildings labeled for office, pattern making, cutting, raw stock, stripping, gluing and finished stock. ABCO was present until approx. 2000 when Ellis Packing West replaced them as listed in the city directory.	136 Victoria Rd S	45	Pulp, Paper and Paperboard Manufacturing and Processing	Offsite		Groundwater
	Potential USTs - On the 1960 FIP, McGregor Sportswear of Canada was shown to have 2 fuel oil USTs (2,500 gal each) on the property at 136 Victoria Rd S.	136 Victoria Rd S	28	Gasoline and Associated Products Storage in Fixed	Offsite		Groundwater
	Scrap Yard - Joe Brown & Son Ltd, a junk yard, is shown on the 1960 FIP at 150 Victoria; ERIS records include Hendersons Disposal Systems Ltd as the owner, and list the facility as a transfer service from 2000 to 2004, and 2005 as an Ontario numbered company.	150 Victoria Rd S	49	Salvage Yard, including automobile wrecking	Offsite		Groundwater
	Former Fuel Storage Facility - Multiple companies have been listed at 154 Victoria Rd S (Shell Canada Products, Doug Pollock Fuels Ltd, Granger Fuels) as an expired TSSA fuel storage facility with gasoline and diesel. A spill was reported in 1988 due to container overflow of 150 L of gasoline to the gravel surface. The 1946 FIP shows 6 gasoline USTs, and the 1960 FIP shows 13 gasoline USTs and an oil warehouse; both listed as Canadian Oil Companies Ltd.	154 Victoria Rd S	28	Gasoline and Associated Products Storage in Fixed Tanks	Offsite		Groundwater
	Former Paint Application - A cabinet manufacturer was shown on the 1960 FIP, Gilson Manufacturing Co. Ltd. Cabinet Division at 57 Victoria Rd S with buildings labeled for steel storage, tubing room, steel room, washer, dryer, office, paint spray, transformer.	53 Victoria Rd S	39	Paints Manufacturing, Processing and Bulk Storage	Offsite		Groundwater
	Chemical Manufacturer or Distributor - Robert On Guard Products was listed in the chemical facilities records.	490 York Road	8	Chemical Manufacturing, Processing and Bulk Storage	Offsite		Groundwater
	Transformers - The National PCB records list up to 7 transformers on 490 York Road associated with Sherwood Forest Investments (formerly Hamril Investments). The volumes listed total approximately 1,600 L. Transformers (7 total) are shown on the 1960 FIP on the enameling building of Guelph Stove Co. Ltd.	490 York Road	55	Transformer Manufacturing, Processing and Use	Offsite		Groundwater
APECs from Offsite PCAs to the South							
APEC-32 (Offsite South)	Screw Manufacturing - Linread Canada Ltd. is shown on the 1960 FIP as a screw manufacturer, and is listed in ERIS reports as a industrial fastener at 24 Hayes with records until 1998. "Jet" is listed as a manufacturer of metal dies at this location with records between 1993 and 1998. Multiple Scott's Directory listings are reported for this address for machinery/equipment/ industrial fan and fabricated metal tools/product manufacturing (Daltec Industries, Allen Simpson Marketing and Design) with established dates of 1984 and 1975, and records up to 2006. A spill was reported of slurry to the road in 2014.	24 Hayes	34	Metal Fabrication	OffSite	VOCs, PHCs, PAHs, metals	Groundwater
	Former USTs - One gasoline UST is shown on the 1960 FIP on the south side of the building at Traders' Plumbing and Heating Supplies Limited at 150 Stevenson Street South.	150 Stevenson St S	28	Gasoline and Associated Products Storage in Fixed	OffSite		Groundwater
	Former Transportation Company - The 1960 FIP indicates a transportation company (Direct Winter's Transport) at 101 Beverley and city directories the company was present from the early 1950s to 1960s.	101 Beverley Street	11	Commercial Trucking and Container Terminals	Offsite		Groundwater

Table 7.3-1. Areas of Potential Concern

Phase One Environmental Site Assessment, 200 Beverley Street, Guelph, Ontario

Areas of Potential Environmental Concern (APEC) ID		Location of APEC	Potentially Contaminating Activity (PCA)[a]		Location of PCA [b]	Contaminants of Potential Concern (based on AP method groups) [c]	Media Potentially Impacted (groundwater and/or soil)
APECs from Offsite PCAs to the West							
APEC-33 (Offsite West)	Window Manufacturing - Clear Choice Window Manufacturing Inc. is listed in the Scott's Manufacturing Directory; established in 1990, and a 1,600 ft plant size.	145 Stevenson St S	43	Plastics (including Fibreglass) Manufacturing and	Offsite	VOCs, PHCs, PAHs, metals	Groundwater
	Metal Treatment - Choice Enterprises is listed in the Scott's Manufacturing Directory; as coating, engraving, heat treating, and allied activities; established in 1998.	147 Stevenson St S	33	Metal Treatment, Coating, Plating and Finishing	Offsite		Groundwater
	Spring Manufacturing - ERIS records indicate heavy gauge spring manufacturing at 60 Johnston Street as Steele Bros. Ltd., the Scott's manufacturing directory record indicates the company was established in 1986 with a plant size of 6,500 ft^2. The 1960 FIP shows the H.I. Thompson Co. of Canada Limited (Aircraft Insulation) with a factory, spring room, spray room, transformer, and cement storage.	60 Johnston Street	34	Metal Fabrication	Offsite		Groundwater
	Former Refractory Facility - Former Foundry Services of Canada (FOSECO) facility operated at 201 Alice Street until approximately the late 1990s, had a known contaminated plume in the shallow groundwater occurring at the bedrock/overburden interface, migrating northward and a groundwater treatment system for toluene (P&R, 1991). A certificate of approval record was issued in 1989 to Foseco for the toluene stripper for groundwater. The 1960 FIP indicates the following buildings: tablet making, lab, shipping, mixing, warehouse, ball mill, elevator, transformer, oil storage, blending, mouldable exothermic feeding compound, incinerator.	201 Alice Street	34	Metal Fabrication	Offsite		Groundwater
	Motor Vehicle Parts Manufacturing - BP Canada Energy Company is listed in ERIS operating at 201 Alice Street.	201 Alice Street	57	Vehicles and Associated Parts Manufacturing	Offsite		Groundwater
	Former Spill - A spill was reported at the corner of Alice and Stevensons Street of 15 L of windshield washer fluid and antifreeze to a catch basin a motor vehicle accident in 2016.	Stevenson and Alice Street	27	Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation	Offsite		Groundwater

Notes:

[a] PCA – potentially contaminating activity (as defined by O.Reg. 153/04)

[b] Refer to Figure 7-1 for PCA locations

[c] As noted in the "*Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act*" March 9, 2004, amended as of July 1, 2011.

% = percent
"-" = Unknown or data not readily available for review
< = less than
ug/g = microgram per gram
ug/L = microgram per litre
% = percent
APN = Acid Base Neutral compounds
APEC = Area of Potential Environmental Concern
AST = Aboveground storage tank
BTEX = Benzene, toluene, ethylbenzene, and xylenes
CDL = City Directory Listings
CP = Chlorophenols
ELE = EcoLog ERIS Database Search
FIP = Fire insurance plan
ft = foot
ft^2 = square foot
ft^3 = cubic foot
HER = Historical Environmental Reports
ID = Identification
ground surface
kg = kilogram
L = litre
lb = pound
m = metre
m^3 = cubic metres

MOECC = Ontario Ministry of the Environment and Climate Change
offsite = Within Phase One Study area, outside the Phase One Property
onsite = Phase One Property
P&R = Proctor & Redfern

PAH = Polycyclic aromatic hydrocarbon
PCA = Potentially contaminating activity
PCB = Polychlorinated biphenyl
PHC = Petroleum hydrocarbon
UST = Underground storage tank
VOC = Volatile organic compound

Table 7.4-1. Phase One Conceptual Site Model

Phase One Environmental Site Assessment, 200 Beverley Street, Guelph, ON

Phase One CSM Element	Summary
Existing Buildings and Structures	No buildings or structures.
Identify Water Bodies in the Phase One Study Area	Waterbodies within the Phase One Study area include a portion of the Hanlon Creek and Mill Creek Swamp located off Site, but in the southern/central portion of the Phase One Study Area as shown on Figure 2-1.
Areas of Natural Significance	No identified areas of natural significance are located wholly or partly within the Phase One Study Area.
Presence of Drinking Water Wells	No drinking water wells were identified on the Phase One Property. Thirty water wells are located within the Phase One Study Area as shown on Figure 4-1.
Identify Roads within the Phase One Study Area	Figure 6-1 presents the roadways and land use within the Phase One Study Area.
Adjacent Property Uses	Figure 6-1 presents the adjacent property use based on City of Guelph Zoning plan. The adjacent use based on this and observations from the site reconnaissance are: • To the north: residential, industrial, and commercial • To the east: residential, industrial, and commercial • To the south: residential, industrial, and commercial • To the west: residential and commercial
Identify PCAs in the Phase One Study Area	The following PCA types were found in the Phase One Study Area: • 8 – Chemical Manufacturing, Processing, and Bulk Storage • 10 – Commercial Autobody Shops • 11 – Commercial Trucking and Container Terminals • 12 – Concrete, Cement, and Lime Manufacturing • 27 – Garages and Maintenance and Repair of Railcars, Marine Vehicles, and Aviation Vehicles • 28 – Gasoline and Associated Products Storage in Fixed Tanks • 30 – Importation of Fill Material of Unknown Quality • 32 – Iron and Steel Manufacturing and Processing • 33 – Metal Treatment, Coating, Plating, and Finishing • 34 – Metal Fabrication • 37 – Operation of Dry Cleaning Equipment (where chemicals are used) • 39 – Paints Manufacturing, Processing, and Bulk Storage • 45 – Pulp, Paper, and Paperboard Manufacturing and Processing • 46 – Rail Yard, Tracks, and Spurs • 47 – Rubber Manufacturing and Processing • 49 – Salvage Yard, including automobile wrecking • 54 – Textile Manufacturing and Processing • 55 – Transformer Manufacturing, Processing, and Use • 57 – Vehicles and Associated Parts Manufacturing Table 7.2-1 summarizes the details of the PCAs identified in the Phase One Study area; locations are shown on Figure 6-1.
Identify APECs	Thirty-three (33) APECs are identified for the Phase One Property.

Table 7.4-1. Phase One Conceptual Site Model

Phase One Environmental Site Assessment, 200 Beverley Street, Guelph, ON

Phase One CSM Element	Summary
COPs	The COPCs identified within the Phase One Study Area include metals and inorganics, VOCs, PHCs, PAHs, PCBs, ABNs, and CPs. This list includes COPCs that are confirmed to be present based on historical investigations. Based on previous reports and contaminant concentrations, there is a potential for free phase product to exist on the Site.
Presence of Underground Utilities	Although utilities have been disconnected on Site, piping and bedding have not been removed, and therefore, there is potential for utility corridors to be providing a preferential route of contaminant migration.
Regional/Local Geology	The Site topography varies from approximately 315 and 316.5 masl based on topographic information and previous investigations completed at the Site. The Site and surrounding lands generally slope southeastward to the Eramosa River. Geology from previous investigations indicate subsurface materials consisting of fill (varying from 0.3 to 3.2 m deep), underlain by native silty fine sand. The approximate bedrock depth based on past investigations on the Site was 2.0 mbgs (elevation of 313.5 masl) and ranged from approximately 0.7 m to 3.4 mbgs (elevation of 312.7 to 315.0 masl). The bedrock was described as dolostone, grey, porous and highly fractured with a rock quality index indicating it is highly weathered and fractured (GLL 1999). The regional geology indicates the Phase One Study Area consists of "silt to sandy silt matrix, becoming silt to silty clay near Lake Erie, strongly calcareous, moderate to low clast content decreasing southward" (OGS 2000) and bedrock of the Guelph Formation, consisting of sandstone, shale, dolostone, siltstone (OGS 1991). The bedrock elevation is approximately 305 masl based on *OGS Preliminary Map P.224, Guelph Area, Southern Ontario, Bedrock Topography Series* (Karrow 1979).
Regional/Local Hydrogeology	Groundwater levels at the Site have been measured during previous investigations between 2.02 and 4.13 mbgs (310.84 to 316.40 masl), with an inferred groundwater flow direction to the south towards the Eramosa River.
Uncertainties Affecting the Validity of Phase One CSM	On the basis of the uncertainties presented within the Phase One ESA report, it is possible that a PCA/APEC or land use has not been identified within the individual components of the Phase One ESA. Information was gathered from numerous sources (that is, aerial photographs, City Directories, database searches, historical reports, interviews, and site reconnaissance), which decreases the chance that a major PCA or land use was not identified in this Phase One ESA. Many aspects of the CSM have been previously studied and verified through subsurface investigations (for example, groundwater flow direction); these aspects are not directly affected by the noted uncertainties: • Quality of aerial photographs may not allow some features to be clearly identified, and professional judgment was used to relate the historical features identified in the aerial photographs to present day locations. • Municipal addresses are known to change. • Information provided by interviewed individuals could be based on hearsay or personal opinion.

Notes:

ABN = acid base neutral compound
APEC = area of potential environmental concern
COPC = contaminant of potential concern
CP = chlorophenol
CSM = conceptual site model
ESA = Environmental Site Assessment
m = metre(s)
masl = metre(s) above sea level
mbgs = metre(s) below ground surface
PAH = polycyclic aromatic hydrocarbon
PCB = polychlorinated biphenyl
PCA = potentially contaminating activity
PHC = petroleum hydrocarbon
VOC = volatile organic compound

Appendix D2
Phase II ESA Summary

Appendix D2. Phase Two Environmental Site Assessment Summary

This appendix provides an overview of the Site investigation for the CH2M HILL Canada Limited (CH2M), now a wholly own subsidiary of Jacobs Engineering Group Inc. (Jacobs), draft Phase Two Environmental Site Assessment (ESA) document for the property identified as the former International Malleable Iron Company (IMICO) foundry facility in Guelph, Ontario. The Phase Two ESA is based on the recent Jacobs subsurface environmental investigations, which occurred from September 2017 to March 2020, and historical investigations conducted by the following companies:

- Proctor & Redfern Limited (P&R) (1991)
- Gartner Lee Limited (GLL) (1999, 2004)
- Earth Tech (Canada) Inc. (Earth Tech) (1999)
- Decommissioning Consulting Services Limited (DCS) (2007, 2014)
- AECOM Canada Limited (AECOM) (2012; 2013; 2014; 2015; 2016; 2017a,b)
- WSP Canada Inc. (WSP) (2016)

This Phase Two Summary provides an overview for the scope of work and results of the current investigations, which concluded in March 2020. Appendix D3 provides the Phase Two Conceptual Site Model (CSM), as documented in the draft Phase Two ESA.

The City of Guelph (City) retained Jacobs to provide environmental services for the property located at 200 Beverley Street in Guelph, Ontario, hereafter referred to as the "Phase Two Property" or "Site" (Figure 2-1 [Appendix D3]). The Site is approximately 5.2 hectares (ha) in size and is located east of downtown Guelph. The Site currently consists of vacant land historically used for industrial purposes. All onsite buildings have been razed, with concrete floor slabs still in place.

The Site has undergone several subsurface environmental investigations between 1999 and 2020. Jacobs has conducted field work to support and update these previous investigations at the Site; to meet current Ontario Regulation (O. Reg.) 153/04 (MECP 2011a), regulatory requirements; and to investigate or further investigate areas of potential environmental concern (APECs) identified during the Phase One ESA (CH2M 2017). The Phase Two ESA is also being completed to support the filing of a Record of Site Condition (RSC) for the Site to facilitate potential redevelopment of the Site.

Proposed Future Land Use

It is Jacobs' understanding that the City is considering the property for potential redevelopment of the Site from industrial to one or more of residential, parkland, community, or commercial land use purposes.

Overview of Site Investigation

The Site has undergone several subsurface environmental investigations between 1999 and 2020. The current Phase Two ESA activities on the Site were completed between September 2017 and March 2020 and consisted of soil borings, test pits, and installation of groundwater monitoring wells. Analytical data from a total of 147 investigative locations advanced previously across the Site as part of historical Phase Two ESA investigations were considered reliable for use in the current Phase Two ESA. An additional 104 investigative locations (21 boreholes, 25 test pits, and 58 monitoring wells) were advanced as part of the Phase Two ESA investigation between 2017 and 2020. Analytical data from a total of 173 soil sampling locations and 94 groundwater sampling locations were used for the evaluation of contaminants of concern (COCs) as part of the Phase Two ESA.

The purpose of the Phase Two investigations were to:

- Support and update previous studies
- Meet current O. Reg. 153/04 (MECP 2011a) regulatory requirements

- Investigate or further investigate APECs identified during the Phase One ESA (CH2M 2017)
- Provide data to support future remedial activities, a Risk Assessment (RA), or both, that will need to be conducted prior to Site redevelopment

In addition, the report is intended to support the filing of an RSC for the Site to allow for future redevelopment of the Phase Two Property.

During the Phase One ESA, CH2M identified areas where potentially contaminating activities (PCAs) have occurred on the Phase Two Property and on lands within 250 metres (m) of the Phase Two Property. PCAs occurring on the Phase Two Property were subsequently carried through the investigation as APECs, as required by O. Reg. 153/04. When offsite PCAs were identified as having the potential to impact the Phase Two Property, they were also carried through the investigation as APECs.

As summarized in the Phase One ESA (CH2M 2017), 33 APECs were identified on the Phase Two Property; of which, 29 were attributable to onsite PCAs, and 4 were attributable to offsite PCAs (located within 250 m of the Phase Two Property). Figures 4-1a and 4-1b (Appendix D3) show the onsite and offsite PCAs and their associated APECs, respectively. These APECs and PCAs were the focus of the Phase Two ESA activities. Figure 4-2 (Appendix D3) shows the APECs identified in the Phase One ESA for the Phase Two Property, as well as the historical and recent Phase Two ESA borehole and monitoring well locations.

The principal objective of the Phase Two ESA is to enable the assessment and update of current Site conditions (considering previous findings and Site work), to identify general and current subsurface impacts that will need to be managed during Site redevelopment. The Phase Two ESA included multiple soil and groundwater Site investigations, as follows:

- Review of historical reports for previous subsurface investigations. A total of 111 boreholes, test pits, and confirmatory samples, and 36 monitoring wells were advanced or installed as a part of the historical investigations, resulting in 184 historical soil samples considered reliable for use in the Phase Two ESA. Groundwater samples were collected in 2007 by DCS, 2010 to 2016 by AECOM as part of an annual groundwater monitoring program, and 2016 by WSP, resulting in 186 historical groundwater samples that were considered reliable for use in the Phase Two ESA.
- Drilling of 42 boreholes and advancement of 25 test pits for the collection of selected soil samples analyzed for COCs to address data gaps identified while reviewing the current and historical data, and to assess and determine subsurface stratigraphy. Boreholes and test pits were advanced as follows:
  - October 2017: 17 boreholes were advanced (BH17-200 through BH17-204, and MW17-100S, MW17-101D, MW17-102D, MW17-103D, MW17-104D, MW17-105D, MW17-106D, MW17-107S, MW17-108S, MW17-109S, MW17-110S, and MW17-111S) to depths of 0.89 to 3.2 metres below ground surface (mbgs).
  - October 2017: 9 test pits were advanced (TP17-300 through TP17-308) to depths of 1.22 to 2.59 mbgs.
  - June-July 2018: 14 boreholes were advanced (BH18-204 through BH18-208, and MW18-117S, MW18-120D, MW18-121S, MW18-122D, MW18-123D, MW18-124S, MW18-125S, MW18-126D, and MW18-129D) to depths of 2.29 to 3.66 mbgs.
  - July 2018: 11 test pits were advanced (TP18-309 through TP18-319) to depths of 1.22 to 2.90 mbgs.
  - April 2019: 7 boreholes were advanced (BH19-100i, BH19-100ii, BH19-102i, BH19-102ii, BH19-209 through BH19-211) to depths of 0.30 to 3.05 mbgs, which included locations to confirm pH at MW17-100 and volatile organic compounds (VOCs) at MW17-102D.
  - February 2020: 4 boreholes were advanced (BH18-207i, BH20-212 through BH20-214) to depths of 1.83 to 3.66 mbgs.
  - February 2020: 5 test pits were advanced (TP20-320 through TP20-324) to depths of 1.52 to 2.39 mbgs.

- Installation of 58 groundwater monitoring wells, and sampling from an additional 36 historical monitoring well locations, as follows:
  - September 2017: 26 existing monitoring wells were sampled (OW02, OW03-I, OW03-II, OW07-31, OW07-32, OW07-33, OW07-34D, OW07-34S, OW-07-37, OW07-38S, OW11-I, OW11-II, OW12, OW13-39D, OW13-39S, OW15, OW16, OW17, OW19, OW22D, OW22S, OW23D, OW24D, OW24S, OW25, and OW31).
  - October 2017: 17 monitoring wells were installed to depths ranging from 3.66 to 15.29 mbgs. 13 wells were installed in the overburden and bedrock contact zone: MW17-100S, MW17-101S, MW17-103S, MW17-104S, MW17-104D, MW17-105S, MW17-106S, MW17-106D, MW17-107S, MW17-108S, MW17-109S, MW17-110S, and MW17-111S. Screen depths ranged from 1.22 to 3.66 mbgs and 7.01 to 8.53 mbgs. 4 wells were installed in the Eramosa Formation bedrock unit: MW17-101D, MW17-102D, MW17-103D, and MW17-105D. Screen depths ranged from 6.3 to 7.82 mbgs and 13.76 to 15.29 mbgs. Groundwater samples were collected in October and November 2017.
  - March 2018: 12 existing monitoring wells were sampled (MW17-101D, MW17-108S, OW07-31, OW07-33, OW09-II, OW11-II, OW12, OW13, OW14, OW19, OW22S, and OW23S).
  - April 2018: 5 existing monitoring wells were sampled (MW17-101D, OW07-33, OW09-II, OW11-II, and OW22S).
  - July 2018: 2 existing monitoring wells were sampled (MW17-100S, MW17-104D).
  - July 2018: 27 monitoring wells were installed to depths ranging from 4.04 to 20.32 mbgs. 14 wells were installed in the overburden and bedrock contact zone: MW18-112S, MW18-113S, MW18-114S, MW18-115S, MW18-116S, MW18-117S, MW18-118S, MW18-119S, MW18-123S, MW18-124S, MW18-125S, MW18-121S, MW18-127S, and MW18-131S. Screen depths ranged from 2.51 to 4.03 mbgs and 4.26 to5.79 mbgs. 13 wells were installed in the Eramosa Formation bedrock unit: MW18-107D, MW18-112D, MW19-116D, MW18-120D, MW18-121D, MW18-122D, MW18-123D, MW18-126D, MW18-128D, MW18-129D, MW18-130D, MW18-132D, and MW18-133D. Screen depths ranged from 6.4 to 9.49 mbgs and 12.44 to 20.32 mbgs. Groundwater samples were collected in July and August 2018.
  - October 2018: 7 existing monitoring wells were sampled (MW18-128D, MW18-130D, MW18-131S, MW18-132D, MW18-133D, OW25, and OW31).
  - November-December 2018: 13 monitoring wells were installed to depths ranging from 4.27 to 25.32 mbgs. 2 wells were installed in the overburden and bedrock contact zone (MW18-134S and MW18-135S). Screen depths ranged from 2.74 to 4.27 mbgs and 9.75 to 11.28 mbgs. 11 wells were screened in the Eramosa Formation (MW18-105G, MW18-112G, MW18-113D, MW18-114D, MW18-115D, MW18-119D, MW18-122G, MW18-134D, MW18-135D, MW18-136D, and MW18-136G). Screen depths ranged from 4.27 to 5.79 and 23.8 to 25.32. Groundwater samples were collected from all newly installed wells, and two existing wells were resampled (MW17-102D and MW18-112D).
  - March-April 2019: 5 existing monitoring wells were sampled (MW18-114D, OW03-I, OW07-32, OW07-37, and OW25). OW25 was also sampled again in April 2019. 1 monitoring well, MW19-137, was installed in April 2019 in the overburden and contact zone for potential light nonaqueous phase liquid (LNAPL) monitoring.
  - February-March 2020: 90 monitoring wells were sampled. The 3 wells with measured NAPL were not sampled.
- Collection of groundwater levels using an oil/water interface probe from the recently installed wells to determine groundwater elevations and whether free phase product was present.

- Performance of single-well response tests on 15 monitoring wells screened in the various hydrostratigraphic units onsite to improve the understanding of hydraulic properties of the units beneath the Phase Two Property.
- Determination of the applicable Site Condition Standard (SCS).
- Survey of newly installed boreholes, test pits, and new and existing monitoring wells, to a geodetic benchmark.

These investigation activities were considered adequate and justified to meet the general objectives of a Phase Two ESA under O. Reg. 153/04, Site-specific investigation objectives, and to support an RA.

Figure 4-2 (Appendix D3) shows the locations of test pits, borings, and wells, advanced as part of this Phase Two ESA, as well as during historical investigations. Environmental studies were conducted at the Site in the past, and the historical results were used as a screening method to focus the current Phase Two ESA work. Where reliable, as evaluated through a data quality evaluation (DQE), the historical results were used to supplement the Phase Two ESA results. In general, the historical data used are considered valid for inclusion in this Phase Two ESA.

Quality Assurance and Quality Control

Soil and groundwater sampling was performed by Jacobs staff with experience in intrusive field investigation techniques and with the COCs encountered at the Phase Two Property, under the guidance of the Qualified Person for ESAs according to the Ontario Ministry of the Environment, Conservation and Parks (MECP) (O. Reg. 153/04) (QP_{ESA}). Jacobs collected soil and groundwater samples in accordance with the standard operating procedures (SOPs) and field forms, which were developed in accordance with O. Reg. 153/04 (MECP, 2011a).

The following sample packaging, storage, and transportation procedures were followed during the investigation:

1. Reviewed the project sampling plan to verify that samples for the required chemical parameters were collected and submitted for analysis.
2. Verified that the samples listed in the chain-of-custody (CoC) form were included in the sample shipment, and that the correct analysis was requested.
3. Included one laboratory-prepared trip blank in each cooler containing volatile organics (VOCs; benzene, toluene, ethylbenzene, and xylene [BTEX] ; and petroleum hydrocarbon [PHC] fraction [F]1) samples.
4. Dispersed ice throughout the cooler to surround the sample bottles and to maintain a proper temperature of less than 10 degrees Celsius (°C) throughout the trip to the laboratory. Sample containers were packed upright, never lying on their sides, and at least one-third of the cooler space was taken up by ice.
5. Placed a copy of the original CoC form in a resealable plastic bag in the cooler.
6. Kept a copy of the CoC form for the project records.
7. Analyzed samples marked “HOLD” within the required holding time and holding temperature, if analyzed.

Quality assurance (QA) and quality control (QC) samples were collected as required by O. Reg. 153/04 (MECP, 2011a).

Duplicate soil and groundwater samples were collected at a frequency of 1 duplicate for each 10 samples submitted. Duplicate soil samples were collected by vertically splitting core samples into two equal volumes prior to placing them in the appropriate sample containers. Duplicate groundwater samples were submitted ‘blind’ to the laboratory, and field staff documented in the field books each duplicate sample location.

Trip blanks were collected for coolers containing samples being submitted for volatile analysis at a frequency of one per day, regardless of the number of samples. Dedicated sampling equipment was used for groundwater sampling.

Samples were analyzed by ALS Laboratory Group (ALS), a laboratory accredited by the Canadian Association for Laboratory Accreditation Inc. ALS, and subcontractor laboratories overseen by ALS, performed the chemical

analysis in compliance with the MECP, Laboratory Services Branch, *Protocol for Analytical Methods Used in the Assessment of Properties under Past XV.1 of the Environmental Protection Act* (MECP, 2011b).

Jacobs received soil and groundwater certificates of analysis from ALS electronically to reduce the possibility of transcription errors. The analyses were compiled into a database. The automation of data transfers from laboratory instruments to laboratory information management systems also reduced the possibility of transcription errors. The results reported by ALS were quality-checked internally by a project chemist before being uploaded to the database. Analytical results were reviewed and validated by the project chemist.

The data review and validation performed by the project chemist are documented in the DQE reports provided in the Phase Two ESA. The DQE assessed the quality of the analytical results for the samples submitted in batches with the Phase Two Property investigation samples.

The goals of the DQE were to demonstrate that a sufficient number of representative samples were collected, and that the resulting analytical data can be used to support the decision-making process. Based on the data validation findings, all Jacobs data are valid and can be used for making project decisions with the limitations described in the DQE.

In consultation with the project chemist, the QP_{ESA} concluded that the data met the data quality objectives, the decision-making was not affected, and the overall objectives of the investigation and assessment were met.

Applicable Site Condition Standards

O. Reg. 153/04 (MECP, 2011a) under Part XV.1 of the *Environmental Protection Act* addresses the assessment, cleanup, and filing of an RSC for brownfield sites in Ontario and is applicable to the Phase Two Property. Jacobs evaluated the Site based on several criteria to decide which of the generic SCSs provided in the *Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act* (MECP, 2011c) were applicable for a comparison of soil and groundwater results from the Phase Two ESA investigation.

The items in Table 2-3 were considered during the selection of the SCS, as outlined in O. Reg. 153/04 (MECP, 2011a).

The special conditions for environmentally sensitive areas under Section 41 of O. Reg. 153/04 were considered for applicability to the Phase Two Property, as soil pH results ranged from 6.6 to 10.64 based on 103 soil samples. With the exception of two samples, the remainder of the soil samples were found to have a pH value within the MECP's acceptable range (that is, a pH value in surface soil between 5 and 9, or a pH value in subsurface soil between 5 and 11). A review of the borehole logs from the two locations (BH17-204 and MW17-100S) indicated that concrete rubble or dust was likely present in the submitted samples that reported pH values of 10.64 and 9.45, respectively.

The soil from the first location (BH17-204) was determined to be "isolated fill," as concrete foundations were encountered both above and below the soil layer, isolating it from the overburden soils at the Site. For this reason, the soil pH from this sample was not considered representative of Site soils and was removed from consideration in determining soil pH at the Site.

An additional sample was collected at MW17-100S to address the second location with a high pH value. The sample was collected from within 2 m of the original sampling location, at the same sampling depth. The result was a pH concentration of 7.71. Using the average of the two samples as outlined in Section 48 of O. Reg. 153/04, it was confirmed that pH concentrations were within the acceptable range.

The special conditions for land within 30 m of a water body under Section 43.1 of O. Reg. 153/04 do not apply to the Phase Two Property; however, as bedrock has been encountered at less than 2 mbgs, the special condition for shallow soil properties cited under Section 43.1 of O. Reg. 153/04 applies to the Phase Two Property.

The Phase Two Property, and adjacent properties within 100 m, are serviced by a municipal water source. As the groundwater in the vicinity of the Property does and will serve as a raw water supply for a drinking water system, the potable groundwater condition was applied. Based on this information, the Table 6: Generic Site Condition

Standards for Shallow Soils in a Potable Groundwater Condition for coarse-grained soil and residential/parkland/institutional property use (Table 6 SCS) was applied to the Site.

Description of Hydrogeological and Geological Interpretations which Differ from the Generic Standards

The known hydrogeological and geological interpretations of the Site that differ from the MECP assumptions used in the derivation of the generic SCS (MECP, 2011d) include the distance to the nearest downgradient surface water body, minimum depth to groundwater, horizontal hydraulic gradient, and hydraulic conductivity. These Site-specific differences are summarized below and have been considered in the RA report, as required and where appropriate.

Parameter	MECP Value (2011d)	Site-Specific Value	Rationale
